In the past, the basic criterion determining the troop composition of a front and an army for the successful execution of a major offensive operation, as is known, was the necessity to create on the main axis, one and a half, double or sometimes even triple superiority over the enemy in forces and weapons. Therefore, it was completely natural to have the desire to achieve such superiority by means of a maximum increase in the combat composition of formation for the execution of not only the initial, most difficult missions of an operation, but also those in the course of its development. In this way, the strength of front and army formations was determined by the number of large units, and also by the capability of the weapons of destruction, chiefly of artillery and aviation to whose level of development the methods of combat operations corresponded. These methods, although they were basically maneuvering and fast moving, were developed in complex situational conditions, and always required for their initiation and development, the availability of compact groupings of troops and fire, coordination and close lateral contact between them and their separate elements. This is why army and front formations included in their composition a large number of combined-arms large units, not counting the units and large units of arms of troops and special troops. It is known, that the combat composition of a front reached 35 to 40 large units and of an army up to 12 or more large units.

It is perfectly obvious that in view of the existence of nuclear/missile weapons and their limited capabilities, front and army formations can no longer have their former composition in motorized rifle and tank divisions. Under modern conditions, the criterion of the ability of a front and an army to execute its assigned missions is determined by their capabilities to deliver crushing strikes with nuclear weapons and other fire weapons.

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

Considering the above-mentioned conditions in total, the composition of a front for the West European theater of military operations can be defined as 15 to 20 motorized rifle and tank large units, 4 to 6 missile large units and a number of special units.

With the indicated number of large units in a front, the operational density will be from 25 to 35 km for a division (when conducting an operation in a zone of up to 500 km), i.e., 2.5 to 3.5 times larger than was accepted in accordance with the experiences of the past war.

In view of this possible composition of a front, the problem arises as to the number of armies in a front and the number of divisions in an army. We consider that it is inadvisable for a front to have, as formerly, less than three or more than five armies. Concerning an army, its composition should also include no more than 5 divisions plus a missile large unit and special units. This composition, in comparison with 7 divisions, is sufficiently capable of strikes and is more flexible from the point of view of control, does not lead to unnecessary supersaturation of the operational formation with forces and weapons and, consequently, to a possible increase in losses from enemy nuclear strikes. Hence, the need for army corps finally passes away to the degree than an army and a corps cease to be in any way substantially different from one another in their composition. With such limited composition of the armies, army corps could be used in a front in their stead but this step is hardly advisable if only for the reason that in every respect, the control of an army is in its capabilities, undoubtedly a more dependable and secure operational organ for control of troops under modern conditions, when great military erudition is required from a command element on this scale.

Planning the use of nuclear/missile weapons in an operation is the most important and definitive part of the planning of the entire operation. In attributing great significance to this principle, it is impossible, in our view, not to turn attention to a sometimes not thoroughly correct understanding of the role of the missile troops of a front. In concrete terms, we are speaking of certain opinions according to which the initiation of an offensive by front troops should be preceded by a missile operation conducted by these troops, i.e., in other words, an attempt is being made to mechanically extend the principles for conducting missile operations in a strategic plan to the front also.

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

With such an approach to this problem, the fact is overlooked that missile large units and units are the main fire and strike force of the ground troops and are intended not only for combat with enemy nuclear weapons which, as is known, constitutes one of the basic tasks of any missile operation, but for the support of troop combat operations as a whole. For this reason, they cannot, in principle, be planned separately from the utilization of motorized rifle and tank troops, aviation, tube artillery, and other combat weapons of the armies and front as a whole. It is, therefore, all the more important to emphasize the fact that the relative weight of conventional weapons of destruction has sharply decreased at this time.

The missile troops of a front are varied in their combat characteristics and are found at various troop levels. It follows from this, that every type of missile has its definite operational-tactical designation and every echelon of command to which they are subordinate assigns them tasks in the required detail.

Thus, we believe, that striving to conduct missile operations at the level of the front, with the means organizationally included in the composition of the various combined arms elements of the front, has no basis.

Nevertheless, measures for the timely and qualitative planning of the use of nuclear/missile weapons in an operation are complex, many-sided, and therefore require a very correct approach to the delimitation of functions between the commander and staff of the front on the one hand, and the commander and the staff of the missile troops and the air force (VVS) of the front on the other.

However, it must be said that in problems of control of missile large units and units in a front and in an army, various extreme points of view are expressed at times. Some believe that the entire control, including the issuance of commands, must be executed by the commander of troops of the front (army) through the staff of the front (army) which is directly connected with the missile large units and units, others believe it to be advisable to transfer almost all questions of control to the commander of missile troops and artillery of the front (army), leaving to the commander of troops of the front (army) the obligation, in essence, to review and approve the proposals of the commander of missile troops and artillery of the front (army).

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

These extreme points of view are clearly not acceptable and it therefore appears more correct that only the commander of troops of the front with his staff be able to take it upon himself to decide the basic fundamental problems in the utilization of nuclear weapons. It is his prerogative alone to determine the targets for nuclear weapons, the time and sequence of the utilization by the missile troops and aviation, the expenditure of nuclear warheads in an operation, and distribution of them among the armies and missile large units (units) of front subordination.

Of very great significance is the planning of combat with the enemy's weapons of nuclear attack by all possible means (not only with nuclear weapons, as is sometimes done), as well as the organization of control of the means of using nuclear weapons in light of the concrete conditions of the impending operation. In this, the front and army must very carefully work out the problems of ensuring massed fire of several missile large units and units of various subordination for the execution of the most important tasks in the course of the operation.

The staff of the front conducts the operational planning for the use of nuclear weapons, organizes and ensures control of the means of using them through the commanders and staffs of the missile troops and the VVS.

Specifically, the staff of the front (army) must organize reconnaissance of all kinds in support of the utilization of nuclear weapons, organize the collection and analysis of intelligence data, organize communications for control of the means of utilizing nuclear weapons, organize engineer support for the deployment and maneuver of the missile troops, and also organize security and defense of the missile troops and organs of the missile rear services in areas of disposition and during transfers.

At the same time, direct control of the missile large units and units of the front (army) and especially of their fire, must naturally be the prerogative of the commander of the missile troops and artillery.

On the basis of all these considerations, the following sequence of work can be recommended.

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

The commander of troops of the front (army) determines the enemy grouping to be destroyed by nuclear warheads and the most important objectives to be destroyed, the expenditure of nuclear warheads for the missile troops and aviation, the types of nuclear bursts, the order and the time of delivering the nuclear strikes.

The operational directorate of the staff of the front (army), together with the staffs of the artillery and the air army (the representative of the supporting aviation) works out the specific problems of nuclear preparation and nuclear support of the offensive, distributes the objectives for destruction between the missile troops and aviation, determines the yield of the nuclear charge, the type and the height of the burst for the destruction of each objective, the safe distance of our troops from the ground zeros (centers) of the nuclear bursts, evaluates the expected results of the nuclear strikes and the possible resultant radiation situation, determines the large units (units) of missile troops and aviation to be used to deliver strikes and other matters resulting from the specific situation.

After confirmation of the problems which have been worked out by the commander of troops of the front (army), the transmission of fire missions to those who will execute them and the entire work of fulfilling them is organized by the commanders of the missile troops and of the air army personally and through their staffs.

Such a work sequence speeds the planning and transmission of decisions to the troops, and the combined-arms staff and the staffs of arms of troops are freed of the necessity to request and prepare necessary memoranda and considerations for the preparation of nuclear strikes.

The problems of utilizing nuclear/missile weapons must be the basis of the plan of the operation. It must reflect: the objectives to be destroyed, the time and sequence of the delivery of strikes, the expenditure of nuclear warheads with an indication of their yields, the types and heights of bursts and also the coordinates of their ground zeros for each objective, safe distance for troops and the time periods of their readiness, and also a tentative calculation of the use of nuclear warheads in the course of the entire operation. Only after deciding all these problems do the operations of the remaining forces and weapons of the front, the combined-arms formations and large units, the conventional field artillery, the aviation, and other arms of troops and special troops, become reflected in the plan of the operation.

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

It is completely obvious, that there is no need whatsoever to draw up a special plan for the use of nuclear/missile weapons as an attachment to the general plan for an operation. All questions of the organization and conduct of an offensive operation are covered by a single plan of the operation. This is a direct result of the leading role of nuclear/missile weapons in accomplishing the goals and missions of an operation.

Weakening the nuclear strength of an opposing grouping of the enemy and depriving him of his capability to use nuclear weapons is one of the most important tasks, whose correct solution ensures the success of the offensive operation as a whole. It is completely obvious, that planning the fulfilment of the tasks of achieving and maintaining nuclear superiority over the enemy must be carried out within the framework of the nuclear preparation and support of the offensive of the troops of the front.

In this connection, the following should be mentioned. At the present time, we employ such concepts as "fire preparation for an offensive", "nuclear preparation for an offensive", while at the same time such concepts as "artillery and aviation preparation for an offensive" continue to exist. A correct clarification of these concepts, it seems to us, is of a fundamental significance in planning the utilization of missile troops and nuclear/missile weapons. But are all these concepts valid and do not some contradictions exist in this problem?

It seems to us that they all have a quite definite content. Fire preparation for an offensive is a somewhat general collective concept and includes fire strikes by nuclear/missile weapons, as well as by aviation and artillery. Therefore, a direct result of this is that component parts of the fire preparation for an offensive are nuclear, artillery, and aviation preparation.

Fire preparation must be examined and planned as a comparatively brief, powerful, massed, and sudden strike by nuclear/missile weapons, aviation and artillery against the most important objectives of the operational formation of the enemy's troops to a depth required by the specific conditions of the situation.

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

One of the most essential problems in planning nuclear preparation and fire preparation as a whole for an offensive is the ability to accomplish it in the most limited periods of time and at the same time to ensure the delivery of a powerful fire strike against the most important objectives of the enemy. The mass utilization of nuclear weapons in short periods of time is the only way to achieve decisive destruction of the fire power of an opposing enemy grouping, destruction of his main nuclear/missile and aviation means, and also disruption of the control of troops and the disorganization of work of the rear services.

As to nuclear support of an offensive, depending upon the expected nature of the combat operations of the troops, it can be planned to include the delivery of individual, group, and mass nuclear strikes. These strikes must ensure the fire support for the advancing troops in the most vital and intensive (3 to 5 words missing) for the use of nuclear weapons during the days of the operation, obviously, are possible only tentatively during the period when the troops are fulfilling their immediate tasks. Detailed planning of nuclear support against targets and objectives to be destroyed, can apparently be executed only for 1 or 2 days of the combat operations.

Briefly summarizing the thoughts expressed above concerning the influence of new factors on the planning of a modern offensive operation, it is not difficult to reach the conclusion that little remains of former concepts, including those drawn from the experience of World War II. The time has come for a much more discriminating approach to the use of this experience under new conditions which would sweep aside everything which to any degree hinders the further evolution of our views, which should not lag behind the development of the modern weapons of armed combat.

* * *

Taking advantage of the opportunity presented to share thoughts on the pages of this Collection, the publication of which must be warmly greeted, I should like to touch very briefly on an abnormal situation which has been created in connection with the working out of the operational instructions necessary for the Armed Forces.

The fact is that, such instructions, as is known, have not yet appeared since the conclusion of World War II, if we disregard the

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

several published drafts which were not approved even though they were widely used in their time during the training of higher staffs. Such a situation does not help to bring about unity of views and does not provide guidance for long-range elaboration of theories in particular directions.

It is not possible to agree with the point of view which gives preference to so called works which are not intended to give strictly defined recommendations and, consequently, are not to be categorized as either regulations or instructions.

A situation such as this evokes serious concern and in the study particularly of sectors of applied military theory, it leads to the necessity for orienting oneself primarily to analyses of the major measures of operational training, carried out by the types of Armed Forces and the General Staff which, as is known, most clearly elucidate the specifics of a given measure. In addition, the lack of official instructions also gives rise to the situation that the level of preparation and knowledge of generals and officers always depends upon the personal views of superior commanders on any particular question. And since these commanders come and go, it is perfectly obvious what consequences this has.

In passing, it should be noted that in the work published by the General Staff called "Bases of Modern Operations", it is difficult to grasp anything different in the nature of the exposition of problems from what was accepted as the content of previously proposed instructions. There are fewer practical recommendations, but it is questionable whether this is really good. And does this better support the training of young cadres who are moving up and have no combat experience in commanding formations and in serving in higher staffs?

It seems that it would be far more correct to decide in favor of working out those instructions necessary for training the command personnel of the Armed Forces in the conduct of front and army operations, and as a matter of fact, those and others as well. At present, it is intended that the instructions for conducting army operations will be worked out separately from and parallel to the work "Bases of Modern Operations" without any coordination between them, one in the General Staff and the other in the Main Staff of the Ground Troops.

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

The working out of operational instructions must be organized so that it does not become a substitute for the working out of theoretical works in development of and on the basis of these instructions. Therefore, it seems to us, this practice in working out regulations should be judged as an extraordinary inflation of their scope by means of superfluous detail and repetition. That this is very widespread with us can be easily confirmed by looking at previously worked out drafts of similar instructions and even of other works.

Moreover, it is very important to clarify published instructions in a timely manner. Under present conditions, which are unprecedented in rates of development and perfection of combat equipment, one can never be completely sure that the problems have been finally worked out. Obviously, many of them will, to one degree or another but at different times have to be clarified to the extent of the study and revelation of new factors. It is asked, how can this be best done? To republish the instructions yearly makes no sense but nevertheless, every year changes concerning one problem or another become solidified and they must reach the proper people in a timely manner. Failure to do this will result in the fact that many outdated situations in the above-mentioned work of the General Staff will continue to exist along with other recommendations that have been elaborated later.

In order to correct this situation, yearly directives should be issued on operational training, not only stating shortcomings and assigning general tasks for this training, but primarily clarifying those problems and recommendations in previously published instructions which require changes and supplements. In this instance, the significance and authority of these directives will increase immeasurably. As for the republication of instructions, this should be done after a few years, depending on the necessity.

Experience in working out instructions and regulations shows that it is clearly inadvisable to conduct parallel elaboration of them, since this gives rise to the necessity for numerous and frequently fruitless coordination, hampers to a great degree the selection of author groups, and dissipates efforts. It is perfectly obvious that this work could be fulfilled in a significantly more productive and qualitative manner and even in a shorter time of there was a prearranged plan for working out operational instructions and issuing them before the field regulations, and not vice-versa, as is still the case today.

Some Questions in the Further Development and Improvement of the Ground Troops

by

Colonel-General of the Tank Troops P. Poluboyarov

The rapid development of nuclear/missile weapons and their broad introduction into the armed forces predetermined the necessity for a review of previously formed views on the nature, methods, and forms of conducting modern operations and on the role and significance in them of various means of armed combat and also of views on the means of further development of types of armed forces and arms of troops. However, in this natural process, sometimes, under the guise of being something new, positions are expressed which are poorly founded, or entirely unfounded and already repudiated by reality itself.

Recently in our periodical press and in certain speeches, the opinion has been expressed concerning the advisability of repudiating tank armies and the necessity for creating, in place of tank and motorized rifle large units, unified divisions capable of performing varied missions under the complex conditions of a nuclear/missile war.

Taken by itself, this viewpoint is not new. It was even put into practice in the structure of our ground troops and the armies of a number of capitalist countries. Thus, for example, in the French Army which, on the eve of the invasion of German-Fascist troops into France had a significant number of tanks, there was not a single tank division or tank corps. At the beginning of the war, there were only two mechanized divisions in France and a third was in the state of formation. A large portion of the tanks of the French Army were dispersed by small subunits

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

in infantry units and designated for joint operations with the infantry. This could not help but have an effect on the combat effectiveness of the French Army and to a large degree facilitated its rapid destruction by the German-Fascist troops.

In the structure of our ground troops prior to the Second World War there was a similar repudiation of major large units of armored troops. An attempt was made to rectify this serious error but not in time, due to the commencement of war with Fascist Germany. Until the end of 1942 this error continued to have an effect on the operations of our troops, even though we strove to equip combined arms armies with as many tank regiments and brigades as possible. But such an action did not produce the needed effect, and during the course of the war we were forced to create tank corps and tank armies which did play an important role in the successful conduct of all the successive operations of the Second World War.

After the war mechanized armies were created instead of tank armies. Subsequently, it was necessary to abandon these and once more return to tank armies.

Thus, as was proved by our experience and numerous examples from the armies of other nations, measures for the unification of tank and rifle (motorized rifle) large units have thus far not justified themselves. Are there sufficient bases to affirm that under the system which has arisen, of arming ground troops, these measures will be correct? In our opinion such bases do not yet exist.

It is well known that the decisive role in attaining the aims of war and of individual operations belongs to nuclear/missile weapons. The efforts of ground troops are directed toward the most complete and effective exploitation of the results of the application of these weapons with the aim of final defeat of basic enemy groupings and the seizure of his vitally important centers and areas for basing weapons of armed combat, primarily nuclear/missile weapons. Ground troops complete the defeat of armed forces on ground fronts, seize and hold enemy territory and the most important installations.

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

"One of the most basic missions of ground troops, one of primary concern to the command and staffs", indicated Minister of Defense Marshal of the Soviet Union R. Ya. Malinovskiy, "must be the skilful exploitation of the results of strikes by missile troops for the rapid advance of armies and fronts".

On the basis of the nature of modern operations, it is possible to say that in the composition of ground troops the most important role will be played by that arm of troops which by its combat characteristics is able, to the maximum degree, to exploit the results of the effects of nuclear weapons on the enemy, which loses its combat effectiveness to the least extent from nuclear strikes by the enemy, which can successfully conduct active, highly mobile combat operations at high tempos, rapidly overcome broad zones of radioactive contamination, and rout enemy groupings in meeting engagements and battles precipitately.

At the present time such an arm of troops is the tank troops. This is explained by the specific characteristics and combat capabilities of tanks. Tanks are more stable than other weapons under the effects of nuclear weapons against them, possess powerful armament, high mobility, and armor protection, and can operate immediately after nuclear strikes; at the same time their crews are quite dependably protected from the destructive factors of a nuclear burst. The high combat qualities of tanks allow tank troops to exploit effectively the results of nuclear strikes and conduct highly mobile combat operations, to deliver, in coordination with nuclear weapons and air drops, powerful and deep strikes on the enemy during an offensive, and to guarantee the activity and stability of troops in defense.

The high combat qualities of tank troops have predetermined the sharp proportional increase of them in the composition of ground troops and the significant equipping of combined arms large units and formations with tanks. The organizational inclusion of tanks in the composition of combined arms units, large units, and formations, as well as their full motorization, have significantly raised the maneuverability, striking force, stability of ground troops during enemy nuclear strikes, and their ability to conduct combat operations under conditions of the mass utilization of nuclear weapons.

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

The equipping of ground troops with nuclear/missile weapons and the broad introduction of tanks and other armored equipment into their composition have had a decisive influence on raising the combat capabilities of combined arms large units and formations. A modern combined arms army is able not only to penetrate successfully the tactical defense of the enemy but also to direct its efforts rapidly to an operational depth and develop an offensive at high speeds.

Thus, the combat and maneuvering capabilities of combined arms large units and formations have increased significantly. However, is it possible, on the basis of this, to equate motorized rifle to tank divisions or combined arms armies to tank armies, to assert that the former can replace the latter, and on the basis of this to conclude that tank armies are not needed? In our opinion, this cannot be done because the large units and formations named differ from one another not only in quantity of tanks but also in basic combat characteristics and operational-tactical capabilities.

The modern tank army is an entirely new operational formation and by its combat qualities and capabilities is significantly superior not only to the tank army of the Second World War period but also to the postwar mechanized army. It also differs in many aspects from the modern combined arms army. Having in its composition four tank divisions, the tank army is a powerful striking and highly maneuverable tank formation, capable of exploiting the results of the mass use of nuclear/missile weapons in the best manner. The organizational structure and combat characteristics of tanks contain great capabilities for delivering rapid and powerful tank strikes to a great depth, for executing a rapid and broad maneuver on the battlefield, for preserving a significant degree of stability during enemy nuclear strikes and for surmounting wide zones of radioactive contamination with high levels of radiation. By its composition the tank army is homogeneous and much more mobile than the combined arms army.

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

The combat capabilities of a tank army allow it to overcome the enemy defense after mass nuclear strikes more quickly than a combined arms army, to reach an operational expanse rapidly, and there to develop bold, decisive, and highly mobile combat operations, directed in conjunction with missile units, airborne landing forces, and aircraft toward the destruction of the enemy's deep reserves and the achievement of operational aims at the highest possible speeds.

The high maneuverability of large units of a tank army, their great antiatomic stability, and strike-penetration force allow the army to conduct combat operations successfully at a significant distance from the remaining forces of the front and to perform in conjunction with other forces and means the most important missions in the defeat of enemy troops. The role and significance of tank armies in modern operations was defined very exactly by the Minister of Defense, Marshal of the Soviet Union, R. Ya. Malinovskiy, who stated that tank armies were bundles of arrows released from a tightly bound bow string for the swift achievement of the final goals of an operation.

Certain comrades do not see the fundamental difference between tank and combined arms armies and propose doing away with tank armies. In our opinion, this proposal stems from an incorrect understanding of the significance of tank troops in general and tank armies specifically in a nuclear/missile war and from an underestimation of their combat capabilities.

Recognizing the important role of tank armies, we are in no measure trying to belittle the significance and combat capabilities of combined arms armies. Yielding to tank armies in antiatomic stability, mobility, and ability to conduct highly maneuverable combat operations, at the same time combined arms armies possess a number of advantages which allow them to perform many combat missions successfully. The same may be said of tank and motorized rifle divisions.

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted] 1.3(a)(4)

We consider that under modern conditions the necessity for tank armies and tank divisions has in no way diminished in comparison with the Second World War but, on the contrary, it has increased. Speaking of the superfluousness of tank armies, some comrades refer to the complexity of committing them to battle, and the difficulty of securing their flanks and supplying them with various materiel. But these deductions, in our opinion, are not sufficiently confirmed. With the existence of massive, multi-million man armies, the huge spatial scope of a future war and the large variety of missions which ground troops will perform, tank troops and motorized infantry will, for the time being, remain independent arms of troops, and the negation of one or the other of them is premature. A repetition of mistakes committed in the past may now lead to even worse results. We hold the opinion that even with the presence among ground troops of nuclear/missile weapons permitting the destruction of enemy groupings of any composition, the necessity continues to exist for a strike force, for tank troops and their basic large units and formations which are tank divisions and tank armies, and their long-range development and improvement should be given due attention also in the future.

It would not be an exaggeration to say that the presence of tank troops which are more advanced in technical equipment, organizational structure, and methods of operations, also, to a significant degree, in turn stimulates the development of the infantry which must carry out highly maneuverable combat operations in conjunction with tanks. The attempt of certain comrades to reverse the direction of this process is in obvious contradiction with the real course of development of the means and methods of armed conflict, as well as with the position that preferential development must be given to the most modern arms of troops.

The currently accepted organizational structure of large units and formations of ground troops basically corresponds to the modern conditions of conducting combat operations. However, the constant development of weapons of armed combat and methods for their use governs the necessity for its further improvement.

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

The improvement of the organizational structure of tank and motorized rifle large units must proceed, in our opinion, along the line of an even greater decrease in personnel, unprotected by armor, increase in antiatomic stability and viability, strike-penetration force and maneuverability of large units, and also an increase in their ease of control and capability for conducting independent combat operations to a great depth and at high speeds.

In our opinion it is advisable to have tank divisions and tank armies of the same composition. A tank army could consist of 4 to 5 tank divisions, and a tank division of 4 tank regiments of medium tanks. In a tank army as well as in tank divisions it is necessary to have organic nuclear/missile weapons. Instead of a motorized rifle regiment in a tank division it is advisable to have a motorized rifle battalion in each of its tank regiments. It is more advisable to have heavy tank regiments and divisions under army or front subordination and to turn them over in case of necessity to large units and formations during the course of an operation.

Together with improving the organizational forms of troops, great significance is acquired by the question of the means of long-range development of tanks and other armored equipment.

In the armament of our ground troops there are T-55 medium tanks and T-10M heavy tanks which more than other combat vehicles guarantee protection of the crew from the influence of the destructive factors of a nuclear burst and are best suited for operations under conditions of the mass utilization of nuclear weapons, and by their basic combat characteristics are significantly superior to foreign tanks of corresponding types and years of manufacture. However, it would be a mistake to suppose that these tanks do not need improvement. New conditions of conducting combat operations make radical improvements in the combat qualities of tanks essential and force the working out of new directions in their development, because the possibilities of further improvement of tanks by old methods are, in practice, almost completely exhausted. In this connection, the question arises as to along which directions our tank construction must develop, and which types of tanks is it more advisable to have in the armament of ground troops?

[redacted] 1.3(a)(4)

9

[redacted] 1.3(a)(4)

[redacted]

1.5(a)(4)

In recent years the question of the future of tanks has been broadly discussed in our military press, on the pages of which are expressed the most varied proposals and opinions, some of which even cast doubt generally on the possibility of successful tank operations on the field of combat with modern antitank weapons.

It is well known that the appearance of tanks brought forth the need for weapons to combat them. Such a weapon was first of all artillery: initially conventional, field; later antitank, special. All subsequent development of tanks was carried out in a competition between the protective characteristics of their armor and the destructive capabilities of armor-piercing shells. Toward the end of the last war it had already become evident that the superiority in this competition was with shells. By this time, capabilities for increasing the thickness of tank armor and its antishell stability had approached their limits, but the destructive capabilities of shells radically increased in connection with the use of high-explosive charges.

The increase in the proportion of tank troops and their role in performing combat missions under conditions of the utilization of nuclear weapons has given new impetus to searches for more effective antitank weapons. In recent years for arming the armies of NATO countries recoilless weapons and antitank guided missiles have been adopted, the destructive capabilities of which almost doubly exceed the protective characteristics of tank armor. Work to improve these weapons continues. At the same time attempts to create a qualitatively new armor have not as yet reached any appreciable results in practice.

Thus, at the present time, as in the period of the Second World War, a significant gap exists between the protective capabilities of tank armor and the destructive capabilities of antitank weapons. Basing their reasoning on this fact, a number of foreign authors arrive at the conclusion that tanks are weapons of the past and not of a modern war, and they propose doing away with the heavy armor of tanks because the armor is pierced by antitank

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

weapons anyway, and changing to lightly armored, but more mobile and maneuverable, vehicles. This viewpoint finds support among a certain segment of our generals and officers, who propose the creation of a light tank and having it in the armament of ground troops as the basic and only combat vehicle. We cannot agree with this for a number of reasons.

In the first place, a change to tanks with light armor increases the possibility of their destruction not only by antitank but also by other weapons.

Secondly, the chief weapon of destruction under modern conditions is not antitank, but nuclear weapons, and for this reason it is first of all necessary to proceed from a consideration of the impact of the latter. During the conduct of highly maneuverable combat operations under conditions of the broad use of nuclear weapons, the most effective means, capable of protecting a person from the effects of the destructive factors of a nuclear burst, is still the armor of tanks. If it is weakened, tanks lose one of their most important qualities.

Thirdly, with a change to light, thinly armored vehicles, the qualitative superiority in tanks will immediately shift to the side of our probable enemies, in whose armies medium tanks continue to be basic.

Fourthly, data concerning the destructive capabilities of modern antitank weapons reflect at present only the results of firing range trials in the absence of the effects of firing against these weapons, and consequently, without considering the difference between firing conditions on the firing range and in combat. Under equal conditions of the effects of nuclear weapons and other means of destruction on tanks and on antitank weapons, tanks will be in a more favorable situation and will be able to carry out combat operations successfully, even with the existence of effective antitank weapons.

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

Based on the nature of modern operations and the conditions of tank construction in our country and in the major capitalist countries, we consider that until new models are developed for the armament of our army, three types of tanks must remain: heavy, medium, and special amphibious. When tanks with higher performance criteria are created, it is possible that we will do away with heavy tanks and have in our armament, in addition to light tanks, one basic type of tank, but with various armament systems. It seems to us that it does make sense to create light tanks for airborne troops and reconnaissance units and subunits.

In our opinion, tanks of the future must, as in the past, combine in themselves firepower, high mobility, and armor protection and must guarantee maximum possible protection to crews from the destructive factors of a nuclear burst. The preferential development of one or another quality at the expense of other characteristics of tanks might lead to the drastic decrease of their overall combat effectiveness. In connection with this the basic guides in the work of building new tanks must be:

-a further significant increase of the firepower of tanks by improving the quality of rifled and smoothbore guns, and subsequently by installation in tanks of more modern guided missile armament, providing the capability to destroy enemy tanks with certainty at such ranges and with such accuracy as to exceed the capabilities of enemy tanks;

-a sharp improvement in the protection of crews from penetrating radiation as well as improvement in the protection of tanks from high-explosive charges;

-a further decrease in the weight of tanks by new arrangements of parts, the use of light alloys, plastics and other new materials;

-an increase in the maneuverability of tanks and raising their maximum speeds to 60 to 70 km per hour and average speeds to 40 to 45 km per hour;

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

-a significant increase in the cruising range of tanks, an increase in the dependability of their operation, and a decrease in the amount of servicing during the course of combat operations;

-a decrease in tank crews to 2 or 3 persons as a result of complete automation of the combat operations and servicing of tanks;

-the equipping of tanks with more modern instruments for firing, sighting and navigational apparatus guaranteeing the conduct of combat operations at night as well as during the day;

-the maximum standardization of units and assemblies for tanks;

-the creation of an improved system of driving tanks under water;

-the creation of conditions for transport of tanks by air.

All these measures must guarantee in the future the superiority of our tanks over tanks of the armies of capitalist countries. Tank troops equipped with new tanks will be able even more successfully to carry out combat operations under conditions of the mass use of nuclear weapons.

The interests of increasing the mobility of ground troops also govern the necessity to seek means for increasing the combat and maneuvering capabilities of infantry.

Our infantry in actuality is not only unprotected from the destructive factors of nuclear bursts but also from modern small arms. Its mobility and maneuverability on the field of combat is also very low in comparison with tanks. Tank units and subunits are capable of attacking the enemy at combat speeds equal to 12 to 15 km per hour, and of developing an offensive at a speed of 20 to 25 km per hour and more. On the other hand, the speed of movement

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted] 1.3(a)(4)

of dismounted infantry on the field of combat is limited by the capabilities of the human organism and does not exceed 3 to 4 km per hour. The armored carriers existing in the armament of ground troops do not fully guarantee protection of the infantry and its necessary maneuverability on the field of combat.

Thus, the infantry at present is the most vulnerable and least mobile element of the combat structure of the attacking echelon of ground troops. The great difference in the combat capabilities of tanks and infantry hampers the effective exploitation of the results of using nuclear weapons and conducting offensives at high speeds.

With the aim of raising the combat and maneuvering capabilities of the infantry it is advisable, in our opinion, to create as inexpensively as possible a special mass combat vehicle for the infantry, which would permit it to follow the tanks without lagging and to wage combat jointly with them from these vehicles, dismounting only in the most exceptional instances.

We cannot agree with the opinion of certain comrades who propose, with the aim of raising the combat capabilities of the motorized rifle division, increasing the number of tanks in its composition to 300. It is completely obvious that in this case the division will not be a motorized rifle but a tank division. In our opinion, there is no necessity for such an increase in the number of tanks in a motorized rifle division. A more important problem at the moment is the matter of raising the combat capabilities of the infantry. One of the possible ways of solving this problem is the creation of an infantry combat vehicle.

An infantry combat vehicle must be, in our opinion, fully armored, tracked or half-tracked, capable of overcoming obstructions on the field of combat and difficult sectors of terrain on a par with tanks, amphibious, transportable by air, with high viability and antiatomic protection for the crew and troops transported (desant). The maximum speed of the vehicle may be: on wheels - up to 70 to 80 km per hour, on tracks - up to 40 to 50 km per hour.

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted]

1.3(a)(4)

The vehicle must have powerful, but compact and light-weight missile weapons, permitting the conduct of effective combat not only against personnel and various fire weapons but also against armored enemy targets.

The crew of the vehicle may consist of two persons. The passenger complement is a rifle squad. The construction of the vehicle must permit the transported troops to conduct combat without dismounting, as well as provide for the convenient accommodation, boarding, and debarkation of the transported troops under various conditions of the combat situation. The weight of the vehicle must be as little as possible.

With the adoption of such a combat vehicle, the necessity might arise for certain changes in the organizational TO&E structure of tank and motorized infantry large units and units. We are not examining this matter in this article, considering that it can be decided only after the vehicle is created. At present we should only like to indicate very briefly what such a combat vehicle might do for ground troops.

An infantry combat vehicle will provide first of all the possibility for significantly increasing the mobility and maneuverability of motorized rifle units and subunits, which then will be capable of successfully advancing behind tanks under the most complex conditions of combat situations and terrain. Operating from these vehicles, the infantry will not lag behind tanks and always will be able to perform various combat missions together with them.

The high cross-country ability and complete armor of the combat vehicles will permit the infantry to carry out broad maneuver on the field of battle and conduct combat operations under complex and rapidly changing situational conditions both together with tanks and independently.

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted] 1.3(a)(4)

In equipping the infantry with the new combat vehicle, the viability and stability of motorized rifle units and subunits during enemy nuclear attacks and their capability to exploit the results of our nuclear strikes and dross zones of radioactive contamination will be raised.

The presence on the combat vehicle of machine guns and missile mounts capable of engaging in combat with armored and openly positioned enemy targets will sharply raise the firepower of the infantry. Conducting combat operations on these vehicles, the infantry will be able to combat successfully the enemy's fire weapons and personnel and offer more effective support to tanks on the field of combat.

All the properties which the infantry will acquire with the adoption of the combat vehicle will lead not only to raising the combat capabilities of motorized rifle units and subunits but also to increasing the mobility of tank and motorized rifle large units as a whole. Thanks to this, the combat qualities of tank and motorized rifle divisions will correspond more closely to the requirements of a nuclear/missile war.

The high mobility, great strike force, and armor protection of all personnel of the combat subunits of tank and motorized rifle divisions will favor more effective exploitation of the results of the use of nuclear weapons and the delivery of even deeper and more rapid strikes against the enemy. The capabilities of troops for carrying out broad and rapid maneuver from the zone of interior as well as directly on the immediate field of combat will increase significantly.

The presence in the composition of tank and motorized rifle divisions of easily controlled tank and motorized rifle units with equal mobility and maneuverability will provide the capability for rapidly creating such combat formations for combat as to satisfy the various conditions and requirements of a sharply changing situation. These qualities of tank and motorized rifle units will permit,

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

in addition, the avoidance of a prior dangerous concentration of considerable forces and weapons in a limited area on the axis of a major strike and will more fully instill into the practice of combat operations the principle of dispersal of troops and their operations along separate axes. This principle corresponds to the nature of modern operations to the greatest degree.

The advance of large units and units in dispersed formations on a broad front and along axes undoubtedly will decrease troop losses from enemy nuclear strikes, will make it more difficult for him to utilize weapons of mass destruction, and at the same time will permit our troops to carry out a broader and more flexible maneuver of forces and weapons with the aim of reaching the enemy's deep rear area and destroying his troops by units in short periods of time.

In conducting combat operations in dispersed formations and along separate axes, tank and motorized rifle large units will accomplish the destruction of the enemy usually in mobile forms of combat in conjunction with missile units, airborne forces, and aviation. The necessity for a methodical breakthrough of the enemy's defenses no longer arises. The latter will be overcome after nuclear strikes along axes, providing rapid penetration to an operational depth and development of an offensive at maximum possible speed. At the same time, the advance of infantry on combat vehicles following nuclear strikes also must become a regular occurrence in overcoming the defense. Only under this condition can the speed of an offensive be sharply increased and the results of nuclear strikes against the enemy be exploited to the maximum.

In overcoming the defense, the motorized rifle subunits and units will be able to attack the enemy from the march, not dismounting at a line of deployment as has been done up to now. Moving out from the zone of interior after tank subunits, as they approach the main line of resistance, they will carry out necessary reformations while on the march and in conjunction with tanks will overcome the enemy's defense on vehicles in combat or approach march

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

formations. Operating on combat vehicles, motorized rifle units and subunits will be able to maneuver more on the field of combat, more quickly change the structure of combat formations and change if necessary from combat formations to approach march formations or the reverse.

Of course, under varied situational conditions the possibility of the infantry operating in dismounted combat formations is also not excluded when the joint operations of tanks and infantry on combat vehicles are for some reason impeded. However, even in these instances the infantry will be in more favorable circumstances than now. After the infantry has dismounted, the combat vehicles will not be removed to cover, as is done with armored carriers, but will support the combat of the infantry with their fire, advancing after the combat formations of their subunits. During this, the combat vehicles will be kept in constant readiness to load the infantry and provide it with a rapid means of advancing after the tanks.

The fullest high maneuvering capabilities of tanks and motorized rifle large units will come about after overcoming the enemy's defenses. Tank units and large units, in reaching an operational expanse, will break through more boldly and deeply into the depth of the enemy's defenses, knowing that the infantry on combat vehicles will not lag behind them and when needed can unite their efforts with them for delivering coordinated and sudden strikes against the enemy. All this will increase even more the capabilities of tank large units in conducting independent highly maneuverable combat operations at speeds of 100 or more kilometers in a 24-hour period.

Equipping the infantry with the combat vehicle creates new conditions, differing in principle from the past, for troop forcing of water barriers.

First of all, after the infantry combat vehicle has become part of our armament, the requirements of troops for various landing and ferrying means is decreased considerably and operations of the infantry in the forcing of water barriers will no longer depend on troops' having these means.

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted]

1.3(a)(4)

Motorized rifle units and subunits, operating on combat vehicles, will be able to force water barriers while on the march, in the literal sense of the word. Possessing high cross-country and amphibious qualities, the combat vehicles will ensure that troops reach a water barrier rapidly on a broad front, and ensure their rapid deployment and quick forcing of the barrier in combat or approach march formations. Thus, in the majority of cases, motorized rifle subunits and units will be able to surmount water barriers from the march simultaneously with amphibious tanks along the entire forcing sector without carrying out preparatory engineering work for preparing crossings (except for mine clearing).

Having infantry combat vehicles will increase the possibilities for carrying out maneuver with forces and weapons while forcing water barriers and for transferring the efforts of advancing troops from one direction to another. The execution of a subsequent forcing of water barriers from the march will likewise be made significantly easier. Not being tied down by crossing equipment, motorized rifle units and subunits together with amphibious tanks as well as tanks equipped for movement under water, after forcing one water barrier will race toward the next water barrier and force it from the march.

The equipping of motorized rifle units and subunits with an infantry combat vehicle will have a great influence on the nature of troop operations under conditions of strong radioactive contamination of the terrain. Possessing high mobility, motorized rifle units and subunits on combat vehicles will be able not only to rapidly bypass zones of contamination, but also to cross them successfully in directions with the lowest level of radiation. The combat vehicles will provide in this a higher degree of protection for personnel from penetrating radiation and radioactive dust than armored carriers, much less motor vehicles.

Under modern conditions, together with the maneuvering of troops on the ground, great significance is acquired by troop maneuver in the air. On the basis of this, troops, together with their weapons and combat equipment, must be capable of being transported by air.

1.3(a)(4)

[redacted]

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

The mass movement of troops by air, as is well known, is impeded because of the absence of light transportable combat equipment and means with a larger load-capacity for transporting airborne forces. With the creation of a relatively lightweight infantry combat vehicle, an important step toward solving this important problem will have been made. The transportability of the infantry combat vehicle by air will permit the transfer by air of motorized rifle units and large units in future operations in mass formation over considerable distances and in short periods of time.

Naturally, in the future the question will arise of whether all motorized rifle units of tank and motorized rifle divisions should be equipped with the infantry combat vehicle. The solution of this question is directly dependent on the designated operational missions of the large units and the economic capabilities of the country. It seems to us that first of all it would be advisable to equip with these vehicles those motorized rifle units which make up the complement of tank armies and tank divisions of combined arms armies. Subsequently, other large units located in the most important theaters of military operations could be so equipped.

It should be noted that in equipping the infantry with the combat vehicle, the question of raising the mobility of tank and motorized rifle divisions is still not completely solved because there will remain in their composition a relatively large number of subunits and units of other arms of troops which are not protected by armor and have less maneuverability.

Under modern conditions, in the composition of all tank divisions including those in tank armies, it would be advisable to have not trailer but self-propelled mounts, mainly with atomic armament, which are capable of more effectively executing various fire missions during the conduct by tank troops of highly maneuverable fast moving combat operations.

Subunits and units of special arms of troops which are included in the composition of tank and motorized rifle large units and conduct combat as an attacking echelon must

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

also possess increased mobility and greater protection from the destructive factors of nuclear weapons. This brings out the necessity of also developing appropriate means of armament and movement for them.

In the near future, apparently, vehicles can be created for ground troops utilizing for movement the so-called principle of the "air cushion". The adoption of such vehicles will permit a sharper increase in the mobility of infantry and their maneuverability to a level corresponding to modern requirements. The cross-country ability of such vehicles will provide troops with the capability to execute rapid maneuver, to cover large expanses, including significant zones of radioactive contamination and wide water barriers in short periods of time, and to deliver sudden strikes against the enemy from the flanks and rear.

Units and subunits equipped with these vehicles will find the most widespread use as reconnaissance units and forward detachments of attacking troops. By exploiting breaks and unoccupied sectors in the enemy's defense, they will be able to reach the deep rear of the enemy very quickly and execute not only missions assigned to forward detachments but also a portion of the missions which are carried out by tactical airborne landing forces.

For ground troops it is advisable, in our opinion, to build vehicles which would have an average speed of 100 to 120 km per hour and a cruising range of 400 to 500 km, with not less than 30 to 40 per cent of this by air.

The question arises as to whether or not the increase in the combat capabilities of the infantry will reach the point where it will be capable of performing all combat missions with the same success as tanks. It seems to us that this will not occur for this reason. No matter how good the infantry combat vehicles will be, on the basis of its characteristics it will be far from comparable to our basic tank. And because this is so, tank large units and units under other equal conditions will potentially have greater combat capabilities at their disposal than motorized rifle large units and units on these vehicles.

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

The basic advantages of tanks over other combat vehicles will remain: the best protection of the crew from nuclear destruction, more powerful armament, and greater penetrating strike force. The influence of the first factor indicates that under conditions of equal effects by any of the enemy's weapons of destruction losses in tanks will be less than losses in other combat vehicles. Thus, tank troops will better retain a capability for executing combat missions. During operations along separate axes or isolated from the main forces, this will have a decisive significance. More powerful armament will permit the infliction of great losses on the enemy and facilitate the possibility for completing his destruction by a powerful strike by the tanks themselves. All these advantages taken together will provide tank troops with the opportunity to advance at a higher speed and to a great depth. It should also be kept in mind that the development of tanks, even though it encounters certain difficulties, proceeds relatively rapidly in our country. By the time the infantry receives the combat vehicle in its armament, tank troops can receive a new and even more improved and powerful tank.

It should be noted that the development of the infantry in the postwar period proceeded along lines of increasing its strike force and maneuverability, i.e., properties more characteristic of tank troops.

Our present motorized rifle divisions and combined arms armies, on the basis of these characteristics (without taking nuclear/missile weapons into consideration), approach the level of the large units and formations of armored and mechanized troops of the Second World War. Tank troops also have advanced a great deal during this period in technical equipment and organizational forms and have become different. They are constantly reinforced with new models of combat equipment and armament, have a more improved organization, and are capable of carrying out highly maneuverable combat operations at a speed of up to 100 and more kilometers per 24-hour period at a significant distance from the basic forces of a front (army). However, these high combat qualities of tank troops have not yet been

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted] 1.3(a)(4)

fully realized during several training exercises, sometimes efforts are in evidence to utilize tank divisions and tank armies on a par with motorized rifle divisions and combined arms armies, and often they are drawn into long and fruitless combat instead of being utilized for carrying out active and rapid offensive operations to a great depth. For this reason, together with the further improvement of combat equipment, armament, and the organizational structure of troops, it is essential to search for and master in practice such methods of their use as to fully correspond to the changing conditions of conducting combat operations and to permit the maximum exploitation of the results of nuclear strikes against the enemy.

Utilization of the Missile Troops of a Front (Army)

in an Offensive Operation

by

Colonel-General P. Koshevoy

In modern warfare, along with the decisive role of nuclear/missile weapons, extremely important tasks are entrusted to the ground troops.

In close cooperation with other types of armed forces, especially with the missile troops of strategic designation, they are called upon to perform one of the most important tasks of armed combat, which is the annihilation of the enemy's troops on the ground and the occupation of his territory. Successful accomplishment of this task is considerably facilitated by the presence of the most modern means of combat within the composition of the ground troops: missile large units and units of operational-tactical designation and highly maneuverable motorized rifle and tank troops, also equipped with missiles.

After the ground troops were provided with missile large units and units, their fire power increased immeasurably. Fire, which now consists basically of nuclear strikes, has acquired new qualities: there has been a sharp increase in its power and effectiveness. While the role of fire formerly consisted of supporting tank and infantry operations directly on the field of battle, today missile large units and units of the ground troops are capable of destroying major installations and groupings of troops in the entire depth of the operational formation of the enemy.

Due to the high effectiveness of the nuclear/missile weapon, a front can now fulfil its tasks in an offensive operation with a greatly reduced number of forces and conventional fire means.

At present, the front is usually made up of 4 to 5 armies, including one tank and one air army, one or two front missile brigades, as well as large units and units of special troops. Altogether, in this case, there will be 17 to 22 divisions, about 4 thousand pieces (orudiye) and mortars, and up to 600 airplanes within the composition of a front.

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

In comparison with the closing period of World War II, there has been a considerable decrease in personnel and pieces in a front, but on the other hand, missile troops have emerged in the form of front and army missile brigades, as well as the missile battalions of motorized rifle and tank divisions.

A front of the above-mentioned complement contains 58 to 80 launching mounts, including 6 to 12 front, 18 to 24 army and 34 to 44 organic (voyskovoy), and also one or two regiments of front cruise missiles.

By means of these weapons nuclear strikes can be delivered against enemy objectives to a depth of 500 to 600 km. Thus, under conditions when nuclear/missile weapons have become the principal means of destroying the enemy, the problems of the use of these weapons are the basis of the decision of the front (army) troop commander in an offensive operation. The operation as a whole cannot be planned without ensuring, in all respects, the most effective utilization of the missile troops.

The newest means of armed combat and the radical changes in the methods of combat operations to which they have given rise, demand from commanders and staffs of all levels exceptionally accurate and mobile work with a minimum expenditure of time in all command and staff echelons. In view of this, we consider that the established practice of the commander working out a decision on the basis of the information reports of various officials is completely unacceptable under the new conditions.

The commander of the troops of a front (army) must be quite familiar with the condition and capabilities of the missile troops, because only then can he make a well-founded decision for using missiles, without spending time listening to information reports.

It seems to us that in the period of preparation for an operation, it is best for the commander of the troops of a front (army) to make his decision in the presence of the chief of staff, the chief of the missile troops and artillery, the commander of the air army, and the chiefs of the operational and intelligence directorates. Each of the above-mentioned persons must, if necessary, give a brief and clear description of the enemy objectives, the readiness and

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

capabilities of the missile large units and units, the availability of nuclear/missile warheads, and answer other questions of interest to the commander.

In his decision, the commander determines the procedure for the use of the nuclear warheads issued to the front (army), establishes enemy objectives or groupings of troops, the number of warheads, the yield, and the time of strike, and also indicates the ground zero (center) of the nuclear strikes which are intended to destroy the most important enemy objectives.

The staff of the front, together with the chief of the missile troops and artillery and the commander of the air army, organizes the execution of the decision of the troop commander; they organize the reconnaissance and preliminary reconnaissance of enemy objectives, plan the fire tasks, determine siting areas, and carry out the regrouping of missile large units and units. After this the staff of the missile troops and artillery, the staff of the air army, and other interested directorates and departments can plan in detail the thorough support of the missile troops. This procedure of work was applied in special exercises conducted in the district (okrug) and, in our opinion, corresponds fully to the new requirements pertaining to the control of troops.

The initial data, on which the decision to use missile troops is based, consist of intelligence information on the enemy targets and objectives destined for destruction by nuclear weapons, the condition of our missile troops, and the availability of nuclear warheads. Without this information, it is impossible to plan the use of the missile troops.

In the Western Theater of Military Operations, in a front's zone of offensive, the enemy may operate with a group of armies consisting of 2 or 3 field armies (up to 6 army corps, 18 to 20 infantry and armored divisions), reinforced by units of guided missiles and free rockets, cruise missiles, and tactical aviation. Within the composition of this grouping there will presumably be about 140 to 150 objectives which must be destroyed by nuclear weapons of varying yield.

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

It must be taken into account that in preparing and carrying out an offensive operation, we will not always have sufficient information available on the position of the objectives and, because many of them are highly mobile, intelligence information may rapidly become obsolete. At the start of nuclear preparation, we will be able to have more-or-less correct information on only 50 percent of the objectives against which it is necessary to plan and deliver nuclear strikes. The remainder will be destroyed by massed and individual nuclear strikes, as they appear.

By using all the front, army and a greater part of the organic missile launchers, as well as the front cruise missiles, it is possible to deliver 50 to 70 nuclear strikes simultaneously during the nuclear preparation and in the beginning of the nuclear support. This obviously is not adequate for the simultaneous destruction of all enemy objectives. It will be necessary to destroy part of them by missiles of strategic designation or by front and army missiles in the course of follow-up strikes.

There may be instances when the front will have sufficient ballistic and cruise missiles available for delivering a simultaneous strike against all detected enemy objectives. But more often, the number of detected objectives requiring destruction by nuclear weapons will exceed the number of available missile launchers and warheads. Therefore, naturally it is necessary to deliver strikes first against those objectives whose destruction will lead to an abrupt weakening of the basic enemy grouping, disorganize the control of his troops, and, on the whole, change the correlation of forces to our advantage.

It should be borne in mind that, in the preparation for an operation, more time will be spent in working out the decision and planning for the use of missile troops than in the performance of these tasks during the course of combat operations. During the period of preparation and planning of the operation, we can have at our disposal more complete data about the enemy objectives, more time for carrying out preliminary reconnaissance of the objectives and for transmitting the tasks to those who will perform them.

In the course of the operation, however, the decision for delivering nuclear/missile strikes must be made without any delay and be transmitted quickly to the missile brigades, battalions, and batteries. This is possible only when there is mechanization and automation of the data receiving process and of the control of troops as a whole.

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

Experience gained from the special exercise conducted in the district with missile large units indicates that it will take about 3 hours to clarify the plan for the utilization of nuclear/missile weapons and to transmit it from the front to the launch batteries. At the headquarters of the missile troops and artillery this work was performed in one and one half hours; transmitting the tasks from the front headquarters to the missile brigades consumed 40 to 50 minutes, and the work performed at the level of the missile brigade and launch battery also consumed 40 to 50 minutes.

It is completely obvious that the time expended on all the above-mentioned operations must be sharply decreased.

We maintain that in the staff of the missile troops and artillery of a front, all the work connected with clarifying the tasks should consume a maximum of 30 minutes and at the level of the missile brigade and launch battery, 30 to 40 minutes, of which 15 to 20 will be used for technical preparation of the launching assembly for the launch. As various guidance devices and technical communications means are perfected, this period of time will be increasingly shortened.

During the course of an operation, as well as during its preparation, it is best that the decision for delivering a massed nuclear/missile strike be made by the commander of troops of the front (army) in the presence of the chief of staff, the chief of the missile troops and artillery, the commander of the air army, the commander of the operational directorate, and the chief of intelligence of the front. After a brief exchange of opinions and after clarifying the conditions of the situation and the capabilities of the missile troops, the troop commander must determine the ground zero of the nuclear strikes on a map for the missile troops and aviation and set the time for their delivery and the yield of the warheads to be used. The chief of missile troops and artillery of the front and the commander of the air army, on the basis of the commander's decision, ensure the preparation of the appropriate commands and their transmission to those who will carry them out.

Of course, the choice of the method for working out a decision depends largely on the personal characteristics of the individual military commander. However, we are convinced that the suggested method in which the commander of troops of the front, proceeding

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

from an analysis of the situation which has taken shape, personally and immediately makes the decision for the delivery of a nuclear/missile strike, requires the least expenditure of time.

In the exercise conducted in the district, after the commander had announced his decision, the staff of the missile troops and artillery of the front spent about two hours in obtaining the coordinates of the targets, distributing the missions among the units, and in relaying the commands and preparing the batteries for launching. This included 45 to 63 minutes for work within the staff of the missile troops and artillery of the front, 4 to 12 minutes for relaying the commands from brigade to battery, 17 to 23 minutes for preparing the duty batteries for launching, and 45 to 53 minutes for preparing the batteries in waiting positions.

It is perfectly obvious that such squandering of time cannot be tolerated, especially since the lion's share of it is wasted in the staffs and in the transmission of commands by technical communications means.

We believe that under the conditions of highly dynamic combat operations, the time expended, from the moment of beginning to work out the decision at the front to the moment of firing at the launch batteries, must not exceed one hour. This result can be achieved if no more than 25 minutes are used by the staff of the missile troops of the front in preparing all the commands and transmitting them to the front brigades and staffs of the missile troops of the armies, 10 to 12 minutes are used to transmit the commands at the level of the missile brigade and launch battery, and no more than 23 to 25 minutes are used for the work of the launch batteries.

Why do we contend that no more than one hour should be expended for carrying out the tasks enumerated above?

If the decision for delivering a massed nuclear/missile strike against an enemy grouping which is advancing for a counterstrike is made by the commander of troops three hours in advance of the strike, during the period when the enemy troops are still marching to the line of deployment, then there is no guarantee that the intentions of the enemy will be discovered and that his line of deployment will be determined correctly. It is quite possible that during this period of

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

time, the direction of movement of the enemy grouping will be changed and it will not be on the line supposed by us. As a result, the nuclear/missile strike will be delivered against a vacant area. However, if there is a reserve of time available, it is essential that it be used in the most effective way possible for the preparation of the strike: to determine the most probable areas of concentration or congested movement of the enemy troops, especially his nuclear weapons, and to prepare the necessary data for conducting fire with conventional and nuclear charges.

If, however, on the basis of accurate intelligence information, the commander makes his decision one hour before delivery of the strike, by this time the enemy columns will be located somewhere within 15 to 20 km from the line of deployment. In this case, any significant change in the direction of their movement is unlikely and the probability of destroying the enemy groupings will therefore be sharply increased.

A nuclear/missile strike can be delivered immediately upon determining an enemy advance for a counterstrike. But even in this case, the destruction of the columns will be guaranteed only if no more than one hour elapses from the time of their detection to the launching of the missiles. This is explained by the fact that during the movement, for example, of an infantry or an armored division along three lines of march, the length of each column reaches 50 to 60 km and the rate of speed 20 to 25 km per hour. If we determine the coordinates of the heads of the columns an hour before the strike and subsequently deliver a strike against them, the columns will be destroyed.

The best time for delivering a massed strike is at the moment of the enemy's deployment for a counterstrike. In this case, the personnel and combat equipment are outside their concealment and are disposed in relatively compact combat formations. As deployed, enemy infantry or armored division occupies up to 20 km along the front, 8 to 10 km in depth (150 to 200 sq. km.), and has the greater part of its forces in the first echelon with a view to delivering a powerful initial strike.

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

If 4 or 5 nuclear strikes are delivered against the first and 1 or 2 strikes against the second echelon of the division, with a total yield of 300 thousand tons or more, the bulk of the personnel and combat equipment will be put out of action.

Massed strikes against troops advancing for a counterstrike or for other operations must, in our opinion, be preceded by strikes of nuclear and conventional weapons in areas of various defiles and other sectors of terrain that are difficult to traverse, in order to brake the movement and produce congestion of enemy troops.

Thus, delivery of massed nuclear/missile strikes in the course of combat requires quick and decisive actions, principally from those who make the decision for a counterstrike and organize its execution, and also smooth-functioning staff work, reliable intelligence, stability of the technical means of communications, and timely transmission of commands to those who will carry them out.

Proper organization of the control point of the chief of the missile troops plays an important role in the control of missile troops.

In conducting exercises with missile troops, we have avoided locating the control points in tents scattered at considerable distances from each other. The mobile control point of the front has been located in special buses, built on the chassis of MAZ-501 vehicles. All the motor vehicles of the troop commander, chief of staff of the front, chief of the missile troops and artillery of the front, and the chiefs of the operational and intelligence directorates were interconnected by gangways. Officers of the staff of the missile troops and artillery were located in three specially equipped ZIL-157 buses with trailers.

Convenient, compact placement of the control point permitted a decrease in the amount of telephone lines for internal communications and the wide use of selector loudspeaker communications which ensured individual as well as collective receipt of information regarding the situation, simultaneous assignment of tasks to the officers who are to fulfil them, etc.

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

Selector communications were established with all the directing officers (napravlenets) of the armies and missile large units of the front, with the planning group, the intelligence department and with the operations group of the chief of the missile armament department located at the command post (komandnyy punkt--KP) of the front. In the course of the exercise, telegraph apparatus, equipped with a secure communications device (zasekrechivayushchaya apparatura--ZAS), were deployed in direct proximity to the directing officers' buses.

It was established at the exercises that it is possible to shorten considerably the time needed for transmitting orders to the troops and receiving information from the troops, if all the directing officers were located in one specially equipped bus in which were concentrated the receiving and transmitting ZAS and signal-code device (signalno-kodovaya ustanovka--SKU) apparatus and the direct telephone channels for radio relay and radio communications. In the exercise, direct telephone channels for radio relay communications were organized and signal-code communications (SKU) devices were used for communications with the missile brigades and the chiefs of missile troops of the armies.

On the whole, experience from the exercises indicated that radio and radio relay means of communications utilizing ZAS and SKU ensure stable and flexible control of the fire and maneuver of the missile troops. Wire communications, including high frequency (vysokaya chastota--VCh) were found to be unsuitable during combat operations of a highly mobile nature.

Nevertheless, the use of the above-mentioned methods of organizing communications only partially solves the problem of ensuring dependable control of the missile troops. We are of the opinion that in order to achieve a radical improvement in communications, the chief of the missile troops of a front must have his organic means of communication, which would ensure the establishment of radio communications with the missile troops up to and including missile battalions not within a radio network, but only on point-to-point nets. In addition, the control point of the chief of the missile troops of a front (army) must be equipped in such a way as to ensure the transmission of orders with a minimum expenditure of time. It is also necessary to perfect control devices and the preparation of officers' working areas, to work out the sequence of issuing commands, etc. All this will undoubtedly shorten the time expended in the transmission of commands.

* * *

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

In a modern offensive operation it is vitally important to organize correctly and maintain continually coordination of the missile large units and units of operational-tactical designation with cruise missiles and aviation.

In order to coordinate the delivery of nuclear strikes by missile large units and aviation it is necessary to determine for them the objectives to be destroyed and to establish the order and the time of delivery of the strikes. These questions must be resolved more thoroughly and concretely during the conduct of fire preparation and also fire support for an offensive during execution of the immediate task of the front.

Due to the fact that cruise missiles and aviation are capable of destroying the enemy in considerable depth, zonal distribution of objectives for destruction among the missile troops and aviation is not advisable since one zone may contain objectives which it is more advantageous to destroy by missiles than by aviation and vice-versa.

The allocation of objectives within zones should be so calculated as to reduce the effect of nuclear bursts on the flight of the cruise missiles, and for this reason it is advisable to assign to them independent objectives, which are separated by some distance from objectives of ballistic missile strikes. In case of a need for a massed nuclear strike by ballistic and cruise missiles against objectives in the same area, the latter should deliver strikes 1 or 2 minutes before or 10 to 15 minutes after the ballistic missiles. It is also important that there be no nuclear bursts along the flight paths of the cruise missiles, otherwise the missile may turn itself or depart from its course. The launching times of all types of missiles should be designated on the basis of a coordinated time of strike and of the individual flight time of each of them.

The unexpectedness of a massed nuclear strike in an offensive operation is one of the most important conditions of the effective use of nuclear weapons by the missile troops and aviation. It can be achieved if the flight of delivery aircraft over friendly territory is carried out simultaneously with the delivery of nuclear strikes by missile large units or shortly thereafter, and must be done with changes in altitude which will make it more difficult for the enemy's radar stations to detect the delivery aircraft in their approach to

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted]

[redacted] 1.3(a)(4)

the objectives to be destroyed. Therefore, it is sometimes necessary to sacrifice the advantages of a simultaneous strike, especially since, in order to ensure a breakthrough by the aircraft to the objectives, it is necessary to create corridors in the enemy's PVO system for them beforehand.

In organizing coordinated action between missile large units (units) and aviation, it is necessary to establish restricted zones for the flight of aircraft over the combat formations of the missile large units (units) and over regions to be subjected to nuclear strikes by other means.

* * *

The utilization of nuclear/missile weapons depends largely on timely engineer support of the combat operations of the missile troops. Missile troops must reach the area of combat operations without hindrance, at high speeds and, as a rule, at night, and shift rapidly to new siting areas during the course of an offensive. For this reason, it is necessary to transport missiles over long distances to the missile troops, which requires special transportation conditions.

Experience from exercises has indicated that in order to transport missiles to the armies and front missile brigades, it is imperative to designate a special route in the rear area of the front, which must have engineer preparation, well-organized traffic and control services, and appropriate forces for the protection of transports with missiles. This route should be maintained by the forces and means of the front.

Similarly, each army should designate one route for the transport of organic missiles from the army missile-depot battalion (raketno-parkovyy divizion) to the army brigades and battalions. Army routes should be maintained by the forces and means of the army.

In a special experimental exercise, we established that by using helicopters and photography it is possible, in the course of an offensive, to raise the speed of engineer reconnaissance of supply routes to approximately 70 km per hour, compared to the 12 to 15 km per hour maximum by motor vehicles.

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted]

1.3(a)(4)

As yet unresolved are such important problems in the engineer support of the combat operations of the missile troops as the preparation of siting areas and areas of concentration of missile large units and units with regard to ensuring their anti-nuclear protection and camouflage. Taking into consideration the high speeds of a troop offensive (for their own security), it is known that missile large units and units must not remain in one spot for more than 24 hours. Therefore, their engineer support must be so organized that all personnel and combat equipment can be satisfactorily concealed within 4 to 5 hours. On the basis of this requirement, it seems to us that it is also necessary to proceed in providing the missile brigades with engineer equipment.

Camouflage of missile troops, in our opinion, should be up to the front. Therefore, it is intolerable that front camouflage battalions have nothing for camouflaging missile troops. They should at least be equipped with dummy launching mounts.

A few words regarding the organizational structure of missile brigades. Experience indicates that in order to increase the fire power as well as to ensure the viability and the constant readiness of missile large units to conduct fire, missile brigades should be composed of three battalions. The shifting of brigades of this composition in the course of an operation should be so organized that two battalions are in constant readiness to conduct fire, and the third, meanwhile, is moving to the new position. This ensures continuity of the fire accompanying the troops in the course of an offensive.

The general conclusions which we have set forth, based on the special exercise, represent only an initial attempt to investigate the use of missile troops and their control in the course of an offensive operation of a front (army). The joint creative efforts of the generals and officers of our Armed Forces are required in order to complete the study of these important problems.

SUBJECT : MILITARY THOUGHT: " Some Questions in the Preparation and Conduct of Initial Offensive Operations", by Colonel-General A. Babadzhanyan

DATE OF INFO: 1961

APPRAISAL OF CONTENT : Documentary

SOURCE : A reliable source (B).

Following is a verbatim translation of an article titled "Some Questions in the Preparation and Conduct of Initial Offensive Operations", by Colonel-General A. Babadzhanyan.

This article appeared in the 1961 Third Issue of a special version of Voyennaya Mysl (Military Thought) which is classified TOP SECRET by the Soviets and is issued irregularly. It is distributed only within the Ministry of Defense down to the level of Army Commander. The 1961 Third Issue was sent to press on 10 July 1961.

Headquarters Comment: The Special Collection article which is noted in footnotes on pages 4, 6, and 13 was written by Colonel-General N. Pavlovskiy, and was disseminated as [redacted]. It may be of interest to note that the footnote on page 6 refers to the intermediate version of the three known versions of Military Thought.

Some Questions in the Preparation and Conduct of Initial Offensive Operations

by

Colonel-General A. Babadzhanyan

The constant quantitative and qualitative growth of missile weapons and the increase in the quantity of nuclear warheads allotted for the execution of an operation are causing continuous changes in the methods of combat operations of ground troops. These changes are now occurring so rapidly that, at times, that which only several months ago was new and progressive becomes obsolescent and ceases to correspond to the requirements of the day. Specifically, the methods of execution of the offensive operations of the initial period of a nuclear/missile war have undergone such a rapid development. The purpose of this article, which is on the order of a response to a number of articles published in previous issues of the Special Collection, is to examine some of the questions in the preparation and conduct of initial offensive operations.

As is well known, a nuclear/missile war will be of an exceptionally decisive nature. The availability of modern, powerful combat weapons permits even an enemy who is being defeated and is close to destruction to deliver telling thermonuclear strikes against the deep rear area and groupings of the armed forces holding the upper hand. In order to fully deprive the enemy of any opportunity to use nuclear weapons, it is not enough to deliver strategic massed nuclear strikes against his territory. No nuclear strikes can guarantee the complete destruction of all the enemy's weapons of nuclear attack or eliminate his capability to deliver strikes.

The fulfilment of this mission can be guaranteed only by the swiftest capture and occupation of enemy territory. By this very means can our country be made completely secure from strikes by the enemy's ground nuclear weapons and the enemy deprived of bases for his submarine and surface missile-carrying fleet which can still operate on the ocean for a certain period of time after the land forces are destroyed.

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

For the quickest capture of enemy territory (of course, that territory the seizure of which will not require the organization of landing operations across the ocean), it is necessary to carry out a decisive strategic offensive throughout the entire depth of the theaters. In this regard, under no conditions of a situation can one front be slow in shifting to the offensive, or alternate the latter with defense in all or the greater part of its zone of operations. We emphasize that, immediately at the beginning of combat operations, all fronts, without exception, must shift to the offensive on the axes where the seizure of enemy territory is possible and necessary. A shift to the defensive on such axes is not permissible. The troops of the front must shift to the offensive regardless of their condition, even after undergoing enemy nuclear strikes.

In connection with this, in our opinion there must be a change in the point of view regarding the nature of the combat operations of ground troops in the case when the enemy pre-empts us in operations. Previously, we considered that, under these conditions, a front must shift to the defensive in order to repulse an enemy attack. Now, it is necessary to consider that, even in this situation, a front with all available forces will immediately shift to the offensive, which, most probably, will assume the nature of a meeting engagement.

The next question is of great practical interest. What will be the duration and the depth of the first strategic offensive operation directed at attaining the immediate strategic goals of a war?

By looking at a map, it can be seen that the goals of a strategic offensive on the European continent can be defined as the destruction of the armed forces of the aggressor countries located there and reaching the seacoasts of the Atlantic Ocean and the Mediterranean Sea. In terms of depth, this consists on various strategic axes of from 600 to 800 km (Southwestern Theater of Military Operations--TVD) and from 1200 to 2000 km (Western TVD).

According to modern views, the average speed of an offensive can reach 100 km per day. It is also considered that, in a system of strategic offensive, the offensive operations of formations must follow one after the other without operational pauses. Consequently, the tasks of a strategic offensive in the theaters being examined can be fulfilled within 10 to 20 24-hour periods. If adjustments

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

are made in their time periods to account for mountainous conditions, for delays in forcing wide water barriers (for example, straits), and for obstacle zones of radioactive contamination, then it will take more than 20 24-hour periods. It is possible that these time periods will even comprise the duration of the initial period of war.

How many subsequent front offensive operations will it be necessary to carry out on the two above-indicated basic theaters in the initial period of a war?

According to existing opinions, the depth of an offensive operation of a front can be from 500 to 600[1] up to 800 to 1000 km[2]. We consider that the second opinion corresponds to a greater degree to the conditions of the initial period of a nuclear/missile war.

The depth of a front offensive operation is determined by the range of operations of the weapons of destruction, by the maneuver capabilities of the troops, by the capability for uninterrupted supply of material, and by the depth of the enemy's operational formation. In the past war, as a practical matter, the range of the front bomber aircraft was about 300 km; the rear services could, uninterruptedly, support the advancing troops to a distance of not more than 250 to 300 km from the area where they were initially based; the depth of the operational formation of the enemy's group of armies was 200 to 250 km. All this determined the depth of a front offensive operation as 250 to 300 km.

The offensive operations of the concluding stage of World War II occupied a special place in their scope, when a significant quantity of tank and mechanized large units and formations, which sharply increased the mobility of troops, appeared in the composition of our ground troops. For example, the depth of the Vistula-Oder offensive operation was more than 500 km, and the depth of the Manchurian offensive operation was 600 to 800 km. The scope of these operations, achieved in 1945 when the troops did not have those weapons of

2. "Modern War", published by the Military Academy of the General Staff, 1960, page 194.

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

destruction or those maneuvering capabilities which modern ground troops have, shows that the proposed depth of a modern front offensive operation of 1000 km is not fantastic.

Even now the weapons of a front and the means of reinforcing a front can ensure the destruction of the enemy to a depth of up to 500 km. The question of supplying the front with missiles possessing a great range of fire is in the stage of practical resolution. In addition, missile troops of strategic designation will undoubtedly be used in the front zone during the initial period of a war.

In comparison with the past war, the depth of the enemy operational formation has, at present, also increased. Certain elements of the enemy's operational missile rear services are located at a distance of up to 1000 km from the front line.

The only thing that still causes one to doubt the reality of assigning a mission of such depth to a front is the limited capabilities of the operational rear services. The fact is that the capabilities of the rear services have not undergone any substantial changes during the past several years and, to some degree, have even decreased, if one considers the probable destruction of railroads and the mass destruction of motor vehicle roads. Decisive measures are necessary to increase the capabilities of the rear services for delivering material, in the first place, providing the rear services with units and large units of aircraft, helicopters, and motor vehicles with large load capacities, and the extensive introduction of pipeline transport. Only in this case can the rear services ensure the execution of deep and swift offensive operations.

Thus, it will be necessary to carry out 1 or 2 successive front offensive operations in order to attain the immediate strategic goals in Europe: one operation on the Southwestern TVD and two on the Western TVD.

At the present time, various opinions exist as to how the strategic offensive will be executed organizationally.

The authors of the book Modern War believe that in the system of operations in ground theaters the first position will be given to front operations, not to the operations of groups of fronts as it was in the past war.

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

In the article "The Question of the Theory of the Operation of a Group of Fronts",[1] Colonel S. Kozlov considers it necessary to create high commands in all TVD's and to subordinate to them not only front formations but also the other types of armed forces operating in a given TVD (missile troops, the Navy, long-range aviation, and troops of the PVO of the Country).

A compromise is expressed in the point of view presented by Colonel-General M. Pavlovskiy[2] that offensive operations in the initial period of a war can be executed by fronts and groups of fronts.

Let us examine this question. During the years of World War II, beginning with the Soviet Army counteroffensive near Moscow (December 1941 to April 1942), all the main offensive operations were carried out, as a rule, not by separate fronts but by the united efforts of several fronts. Usually, the goals of an offensive operation on a strategic axis were achieved by the efforts of 2 or 3 fronts. The conditions of the past war required this, when an enormous density of weapons and a superiority of no less than 2 or 3 times over the enemy were needed for a breakthrough of defenses. The efforts of several fronts were usually concentrated on such a strategic or operational axis, the geographic conditions of which provided the capability for close operational coordination among the fronts.

In the conduct of a nuclear/missile war, a concentration of enormous masses of personnel and equipment is not required to carry out an offensive. Even now the density of troops has sharply decreased, while the zones of offensive of formations have increased 1.5 to 2 times. All of this indicates that under modern conditions the efforts of one front are sufficient for those axes where in the past war it was necessary to concentrate the efforts of several fronts.

Consequently, the troops of one front will now operate, as a rule, on each of the strategic or important operational axes. It is our view that under these conditions the combining of several fronts into a group is not advisable, if only because operational coordination

1.3(a)(4)

[redacted]

[redacted] 1.3(a)(4)

between fronts operating on independent strategic or important operational axes is not always possible, or is almost impossible. The General Headquarters (Stavka) will organize strategic coordination between the fronts, or rather, implement strategic coordination of the efforts of strategic nuclear/missile weapons with the operations of the fronts.

On the basis of the above, we conclude that in a nuclear/missile war the main role in attaining the goals of armed combat in theaters will belong not to the operations of a group of fronts, but to the system of simultaneous and successive front operations. This does not preclude, of course, the conduct of operations by a group of fronts at individual stages of a strategic offensive operation on axes where operational coordination of several fronts is feasible.

In our view, the limited number of fronts in a nuclear/missile war also makes the formation of TVD commands inadvisable. It is known that, at the beginning of World War II, the number of fronts was limited (five fronts) and corresponded exactly to the number of strategic axes which existed at the time (Northern, Northwestern, Western, Southwestern, and Southern). Under these conditions the fronts fulfilled not only operational, but also strategic missions.

The commands of three axes were created in July 1941, the Northwestern, the Western, and the Southwestern; they were called upon to carry out the operational-strategic direction of the fronts (which generally numbered from 5 to 11 at various periods). The complexity and the intensity of the situation at the fronts of war frequently forced the General Headquarters of the Supreme High Command to directly control the fronts, bypassing the commands of the axes, thereby making them useless. As is known, after existing for about one year altogether, these commands were abolished.

In conducting a nuclear/missile war the number of fronts on the indicated axes will be less than in the past war. The conditions for military operations will become still more complex. The maneuverability of troops and the mobility of the front line will increase by several times. All this provides a basis for considering the creation of commands of axes or of TVD's in a future war inadvisable.

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted]

1.3(a)(4)

In our opinion , the formation of TVD commands is possible only in remote theaters where the control of the armed forces will be difficult for the General Headquarters, for example, in the Far East (as it was in the past war) or on other continents when our troops arrive there.

However, granting the possibility of creating strategic commands in remote TVD, it is not possible to agree with the proposal that the naval forces operating in the waters adjoining the theater should be subordinated to these commands. The mission of supporting ground forces is secondary for the naval forces, in comparison with the missions of blockading enemy countries and of disrupting enemy ocean and sea intercontinental transport, which missions are frequently carried out in remote ocean areas or even on other oceans. For the fulfilment of these missions, a broad strategic maneuver by submarine forces is required. The subordination of all naval forces to the TVD command could thus fetter and limit the Navy's capability of fulfilling its main missions. Of course, the part of the naval forces which will be operating in support of the troops of a TVD (the destruction of enemy strike missile-carrying and aircraft-carrier naval forces, the disruption of enemy amphibious landing operations, the participation in amphibious landing operations of TVD troops, etc.) must be subordinated to the TVD command.

The thought expressed by some authors of articles concerning the creation of operational-strategic commands in our theaters of military operations was undoubtedly influenced to some degree by the presence of such control elements on the territories of the countries of the imperialist coalition. However, such an analogy is not justified here. The fact of the matter is that the American Joint Staff in essence controls the armies of the countries which comprise the imperialist coalition. But the Americans are not in a position to effect centralized control of all the armed forces that make up the coalition and which are dispersed on almost all the continents of the world. Therefore, they formed intermediate control elements, commands of the TVD.

Under our conditions, when theaters of military operations are located on two continents (Europe and Asia) and are connected by land borders with well-established means of communications and supply, it will hardly be necessary to form such an intermediate command as a TVD command.

1.3(a)(4)

Several words on the initial offensive operations of fronts. These operations can begin under various conditions of a situation. The shifting of fronts to an offensive can be preceded by a threatening period. It will take place if a war starts after a significant intensification of tension in the relations between the principal countries of the imperialist coalition and those of the Socialist Camp, and when it becomes clear that the political relations of the two camps will inevitably bring on a military conflict. The threatening period can also take place when a world war starts through involvement of the principal countries in the course of a local war in one of the areas of the world.

War can also be started by a surprise enemy strike, when there will be no threatening period. The most characteristic version of a surprise attack can be the delivery by the probable aggressor of a mass thermonuclear strike against the socialist countries under the guise of carrying out large training exercises.

A surprise attack is the most advantageous method of starting a war. It may be assumed that war will be unleashed by a surprise attack, if the imperialists decide on this. Therefore, in the practical activity of our armed forces and in their operational and combat training, it is necessary to embark decisively on a course for the preparation of troops for the entry into a war which is not preceded by a threatening period. If the armed forces are ready to begin military operations when there is no threatening period, then they will always be able to do so when there is a threatening period.

An important situational condition, under which fronts can begin their initial offensive operations, is the location of the troops of a front in relation to the enemy before the start of military operations. A front (group of forces) which, prior to the start of military operations, is located directly on the border beyond which the countries of the imperialist coalition are located, will come into contact with the ground enemy immediately. However, a front located at a distance from this border at the start of military operations can shift to the offensive only after reaching the line of contact between the aggressor troops and the armies of countries friendly to us.

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

In all cases, the troops of a front will shift to a decisive offensive immediately after a counterstrike or after a strike to frustrate a surprise enemy attack. A counterstrike, or a strike to frustrate an enemy attack, will be carried out on the basis of the decision of the higher party and government leaders of the country; the main role in carrying it out will be played by the missile troops of strategic designation. It is understood that government leaders will also make the decision for the front troops to shift to a decisive offensive.

There is a wide-spread point of view that front nuclear/missile weapons must also participate in a counterstrike to frustrate a surprise enemy attack, which are measures of the Supreme High Command. In our opinion, the front weapons will not be in a position to participate in a counterstrike or in the first nuclear strike for the following reasons:

--the nuclear/missile weapons of a considerable number of the fronts, which are located at a distance from the borders adjacent to the enemy prior to the start of military operations, cannot be used because of the comparatively short range of the operations;

--the nuclear/missile weapons of these fronts, even those directly in the border zone, will not be able to participate in immediate operations, because considerable time (up to several hours, and, under certain conditions, up to several days) will be required to bring them up to combat condition (basically, for the assembly and checking of missiles and warheads).

In addition to the above, it is necessary to take into account the following consideration. In an offensive operation, the planned transport of missiles, special charges, and missile fuel will be greatly hampered because of the mass destruction of communication lines and the destruction of certain depots which had become known to the enemy. Therefore, it is not advisable to expend a significant amount of the nuclear/missile weapons of a front at the very beginning of an operation. They should be saved for subsequent use in the course of an operation and in completing it.

The extensive use of nuclear/missile weapons compels a new approach to solving the problem of the combat composition of a front. In the past war, the combat composition of a front was determined by the necessity of creating a twofold or threefold (and sometimes even more) superiority of forces and weapons over the enemy on the axes of strikes.

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

Under modern conditions, the criterion for determining the composition of a front is its capability to inflict destruction on an opposing enemy grouping with nuclear weapons and to complete its rout with motorized rifle, tank, and airborne large units. Figuratively speaking, one can say that combined-arms and tank large units will now play the role of a "broom" by means of which the front's offensive zone will be cleared of the remaining enemy troops after they are routed by nuclear weapons. Under conditions when, as the result of nuclear strikes, the correlation of forces can rapidly and sharply change in favor of the side that has executed them, an offensive operation of a front can be carried out successfully even when the initial correlation of forces and weapons was equal.

The combat composition of a front in an initial operation will depend on the method of unleashing the war.

If a war starts by a surprise enemy attack, the front will then be forced to start combat operations with a limited number of large units in constant readiness. During the course of an operation, the front will be reinforced by fully mobilized large units and by large units in constant readiness arriving from the zone of interior (in accordance with the plan for the strategic deployment of the ground troops).

If, however, military operations develop after a threatening period, then the first front operation can start with a larger number of troops: large units in constant readiness and those fully mobilized. In all cases, it is necessary to consider that the approach of troops from the zone of interior can be frustrated or delayed by the enemy by means of direct strikes against these large units and also by the destruction of communication routes.

Missile large units and units are the skeleton of the operational formation of a front, without which the conduct of combat operations under modern conditions is impossible. Therefore, in a border district (group of forces), the composition of the missile troops must be such as is necessary for achievement of the objectives of the first operation. In addition, the composition of the missile troops and their supply of ammunition must compensate for the shortage of combined-arms and tank large units when these are put out of action on the field of battle or when their arrival from the zone of interior is disrupted or delayed.

[redacted] 1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

Let us dwell briefly on the methods of operations of the troops of a front in initial offensive operations.

The following factors will exert an influence on the methods of conducting initial offensive operations: the limited number of front troops; disorganization of the enemy's governmental control and the control of his armed forces, and, consequently, the isolation of the enemy's troops and the putting out of action of entire elements of his operational formation; the enemy's lack of prepared and occupied lines of defense; and the existence of large areas of radioactive contamination.

The above-listed factors create favorable conditions for an offensive by several strike groupings on axes. An offensive on separate axes ensures the splintering of the enemy front and a dispersal of his attention and efforts. At the same time, an offensive on axes is much more complicated than an offensive which is carried out with close lateral contact between units, large units, and even armies. During an offensive on axes, each grouping will be in a difficult situation and will have to operate independently with its flanks, and even its rear area, exposed. In view of this, the significance of preparing our command cadres for such operations becomes clear.

In the years of World War II, an offensive was conducted on a solid front in close combat formations, with a methodical breakthrough of enemy positions and defense zones. Actually, combat operations were conducted in the zone of effective fire of the infantry and artillery weapons, i.e., in a zone 10 to 15 km on both sides from the line of contact, if one does not consider sporadic aerial strikes against the depth. Under these conditions, the effect of fire against the enemy was exploited immediately. Close coordination in timing and location was executed between the fire weapons, the infantry, and tanks.

Under modern conditions, the sharply increased capabilities of fire weapons have led them to a contradiction with the capabilities of the infantry and tanks. The infantry and tanks have become incapable of immediately exploiting the effect of nuclear/missile strikes against the entire depth of a defending enemy. To ensure rapid seizure of the entire depth of the enemy defense by active

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

combat operations and to achieve the objectives of the operation in the shortest period of time, it is necessary to increase sharply the rate of the offensive which, by the Directive of the Minister of Defense for Operational Training for 1961, was ordered to be increased to 100 km per 24-hour period. This is a very high rate. It is sufficient to state that the distance covered in a 24-hour period in the execution of a march consists of 180 to 250 km, i.e., only two times greater than the distance which must be covered by attacking troops in a 24-hour period.

In planning an operation, is it possible to guarantee that a rate of, say 100 km per day, will be sustained every day? Certainly not. There will be days in an operation when troops will be able to advance only negligibly, days when they will not move at all, and, possibly, days when they will even fall back. We are speaking of those days when front troops will be repulsing enemy counterstrikes, conducting meeting engagements with the enemy, forcing water barriers, and overcoming substantial zones of radioactive contamination and mountain passes. Consequently, on the other days of the operation, the rate of advance must be such so as to compensate for the days of slow or of no rate of advance, i.e., it must approach the speed of executing a march.

In the offensive operations of the past war, the most decisive results were achieved by encircling the enemy operational groupings and subsequently annihilating and capturing them. However, at the end of the war, especially in the Vistula-Oder operation, the ineffectiveness of encirclement as a form of conducting an operation had already become obvious. Those enemy groupings, around which a solid ring of encirclement was not closed, turned into so-called "roaming pockets" and quickly ceased to exist. But those enemy groupings that were encircled by our troops (for example, the Poznan and the Schneidemühl groupings) continued to fight while surrounded until the end of the war, diverting a substantial number of our troops to them.

We cannot agree with the statement[1] that in a modern war encirclement and destruction of large enemy groupings can be employed along with the delivery of swift, deep strikes on separate axes.

1. Special Collection of Articles of the Journal "Military Thought", First Issue, 1961.

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted]

1.3(a)(4)

Under the conditions of highly maneuvering combat operations, it will be inadvisable to encircle a large enemy grouping which is dispersed over a large area. The limited number of troops in a front will not permit the creation of inner and outer fronts of encirclement and the conduct of methodical combat for the purpose of contracting a ring of encirclement, breaking up the encircled grouping, and destroying it piecemeal. Such operations threaten loss of the rate of the offensive and, possibly, even its frustration. It is much more advisable to use small forces to intercept the main routes of retreat of an enveloped enemy and subsequently destroy him with nuclear/missile weapons. In this, the main body of the front troops must move forward without delay and without glancing back at the encircled enemy grouping.

In the most general terms, this is how we visualize the initial offensive operations of the initial period of a war. Undoubtedly, some of the problems we have examined require further consideration and critical analysis.

Certain Problems in the Organization and Conduct of Modern Operational Defense

by

Lieutenant-General P. Igolkin, Major-General S. Buryak

Recently, our military press has given considerable space to an examination of the problems of modern operational defense. Many comrades who write about these problems attempt, in essence, to adapt the increased capabilities of nuclear/missile weapons to old methods of organizing and conducting defense. At the same time, the view is expressed that under conditions of the use of nuclear/missile weapons, operational defense loses its significance and that in a future war, and especially in its initial period, it will be limited within the framework of army defensive operations.

On the basis of an analysis of the probable conditions of military operations in a future war, we are coming to the conclusion that defense undoubtedly will take place on a tactical as well as an operational scale.

In examining the conditions of the origin and conduct of operational defense, especially in the initial period of a war, we take into account the fact that nuclear/missile weapons are offensive weapons, and that the urge to grasp the initiative in our hands from the very beginning of a war requires the conduct of decisive offensive operations on the most important axes. However, it must also not be forgotten that, under modern conditions, not even an economically powerful state can, in peacetime, maintain in readiness such armed forces, especially ground troops, as to permit it at the beginning of a war to initiate and conduct offensive operations in all possible theaters of military operations. Therefore, offensive operations will be conducted only in the

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

most important theaters of military operations, while our troops can carry out defensive actions on an operational scale in other theaters. The latter may take place specifically in secondary theaters of military operations, especially along our open ocean coastlines, where landings and operations of large enemy amphibious and airborne landing forces of operational significance are fully possible, if not in the first days of a war, at least during its initial period. In these theaters, antilanding defense can be prepared in peacetime, which, at the beginning of military operations, will be conducted not only by an army, but also by a front.

In our opinion, it is even possible to have a situation in which, during the war, a front may be forced to shift to the defensive in a situation which is developing unfavorably in order to wear out the enemy, inflict decisive destruction on him, and create conditions for a shift to the offensive. However, such a short-term defense on the scale of a front is only permissible as an extreme measure in those cases when during a war, due to some unforeseen circumstances, the enemy temporarily seizes the initiative in the use of nuclear weapons on a given axis and by his strikes puts out of commission a large part of the missile weapons of the front. In such an unfavorable situation, to save our own troops and avoid their final defeat, and also to receive new troops arriving from the reserve of the General Headquarters or transferred from other operational axes, the front obviously will be forced to conduct a defensive operation.

Defense, on the scale of an army, will take place most frequently during the conduct of front offensive operations, especially during the initial period of war, when on one or another axes, one of the armies of the first echelon of the front will be forced, temporarily, to shift to the defensive under the strikes of superior enemy forces. The necessity for shifting to the defensive may arise, for instance, when the army is providing cover for the deployment of troops of the front, when repelling an enemy counterstrike, or as a result of a meeting engagement which had an unsuccessful outcome for the troops of the army.

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted] 1.3(a)(4)

Of course, we take into consideration that under modern conditions, the imminent threat of an enemy counterstrike may be eliminated or significantly weakened by massed nuclear/missile strikes. However, under conditions of a difficult situation, when the basic missile weapons of the front are used for the support of troops successfully advancing on other axes, the army which is conducting combat with strong counterstrike groupings of the enemy, may not receive the necessary nuclear/missile support. Under such conditions, the army will be forced to conduct a defensive battle within the framework of the offensive operation of the front. This battle will be a part of the latter and will be of a short-term nature because, in the final analysis, the determining influence on its outcome will be the successful operations of the attacking troops of the front.

The considerations expressed above provide a basis for concluding that our ground troops must be prepared to conduct operational defense on various scales, for which it is very important to develop further the theory of preparing and conducting not only army but also front defensive operations. Proceeding from this conclusion, we shall examine a series of fundamental principles pertaining to the goals, tasks, nature of the formation, and methods of conduct of modern operational defense.

In the past, as is known, the destruction of an advancing enemy was begun and completed by the forces of combined-arms large units and formations which defended, as a rule, on a solid front, and were supported by artillery and aviation. The basic means of achieving the goals of a defensive operation were the fire of artillery, mortars, and small arms, strikes by aircraft, and the counterattacks and counterstrikes of second echelons and reserves. The combat operations of combined-arms large units and formations, at the beginning of an enemy offensive, were developed in sequence for holding solid zones, first in tactical and then in operational depth. To hold the tactical zone of defense, the basic forces and weapons of armies, and in certain instances, of a front, were used. To breach it, the enemy needed a considerable amount of time during which the defender was able to effect the necessary increase of forces and weapons.

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted]

1.3(a)(4)

Defending troops conducted combat operations until they exhausted the strong enemy grouping, which advanced, as a rule, on one of the decisive axes, in compact formations, having close lateral contact between large units. Due to the fact that the defending forces, especially those in the zone of interior, remained undefeated, the defender could use them systematically to form a new front in the zone of interior, or to create a strong grouping designated to deliver a counterstrike which was usually executed with a limited goal, that of reconstructing the defense on the same or new lines.

The methods which we have examined, of combat operations of troops on the defensive in the recent past, fully corresponded to the weapons of destruction and the nature of offensive operations of the enemy which were used at that time. With the appearance of nuclear weapons in the armament of troops, these methods, in essence, began to adapt themselves to them, but retaining, on the whole, the principles of the organization of defense which were used in the past. Thus, it was considered possible to achieve the goal of a defensive operation by inflicting destruction upon the enemy by all types of fire, including missile weapons, and also sustained defense by the main forces of the armies of the first echelon in first or second defense zones which had been prepared in advance along a continuous front, by conducting counterstrikes (in their former meaning) with the aim of routing enemy groupings which had broken through, and re-establishing the lost position or with an even more limited aim. The basic forces and weapons were usually concentrated to hold a specific defense zone and a larger part of the combined arms large units were deployed in the zones in advance.

Certain tendencies to increase the depth of defense zones and areas of troop disposition in them, to create and increase the intervals between battalion defense areas, and also to transfer the main efforts from one zone to another, did not introduce any radical changes in the nature of the formation and methods of conduct of operational defense in comparison with the past.

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

Of course, when the capabilities of nuclear weapons were limited, only single units of nuclear warheads were allotted for conducting a defensive operation, and the only means of delivering them was aircraft, the measures pointed out above helped somewhat to ensure the stability of operational defense because combined arms large units continued to be the main means of destroying the enemy. However, these measures are obviously inadequate under conditions when the basic means of delivering nuclear weapons to their targets have become missiles of various designations which are available to ground troops in sufficient quantity. As a result of being equipped with missiles, the firepower of the ground troops has increased so much that they have acquired the capability of accomplishing the main tasks with nuclear/missile weapons, and of completing the enemy's rout with powerful counterstrikes by combined arms large units, delivered, as a rule, right after the nuclear strikes. This requires a new approach to the solution of the problems of operational defense.

The methods of preparation and conduct of defensive operations which have existed up to the present time and the creation of solid defense zones do not permit troops to exploit to the maximum their sharply increased fire and strike capabilities, to execute, in a timely manner, a broad maneuver on threatened axes during a defensive battle, and, in essence, condemn a significant part of the troops to passive operations. In addition, it is necessary to consider that modern operational defense must withstand methods of operations of the attacker which are fundamentally different from the past.

Now, with the mass use of nuclear weapons in the entire depth of the operational defense, the attacker will have no particular difficulty in neutralizing solid defense zones in short periods of time, and creating significant breakthroughs (breaches) in them. Exploiting these breaches, the enemy's groupings, especially his tank troops, will drive through them on several of the most important axes into the depth of the defense, splitting the formation of the defending troops with the goal of destroying them piecemeal. Simultaneously, nuclear/missile strikes and strikes by

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

strong airborne groupings will be carried out against the depth of the defense. Under such conditions, the large units and formations which are defending on a solid front will scarcely be able to maneuver quickly to threatened axes, and without active and mobile operations, which depend on the possibility of using nuclear/missile weapons, we cannot count on successful combat with an attacking enemy during a defensive battle.

Providing stability for modern operational defense must be based primarily on the utilization of weapons which are capable of using nuclear warheads, i. e., missiles. Only they are capable of dependable destruction of the main striking weapons of the attacker--nuclear weapons--and also of routing his troops and frustrating the offensive. Routing of the enemy will now be initiated, and in most cases carried out, even during the course of established combat operations, by missile troops.

In connection with this, there is no longer any need to create a solid "zonal" defense and even less to utilize a larger portion of the motorized rifle and tank large units in the first echelon for holding the zones. In organizing defense by the system of zones occupied by troops, one can hardly count on successful combat with an enemy, which is advancing on unconnected axes in a large area and with the simultaneous use of airborne forces against the depth of the defense. At the present time, defense can be successful when it is based not on sitting in place, even in prepared positions, but on delivering strikes against the enemy precipitately, even though it be with limited aims. Creating a solid front under these conditions is not only inadvisable but also harmful, because this condemns a considerable amount of forces to passive operations. Now, only a part of the combined arms large units will be used for covering the most important axes and for supporting the combat disposition of the missile troops. It is advisable to designate a large part of them for completing the rout of the enemy by delivering strikes against him and to have a part dispersed in the depth of the defense.

Thus, the goals of operational defense must now be attained by the mass and skillful use of nuclear/missile weapons and the

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

utilization of the basic forces and weapons of the armies, not in combat for holding defense zones, but, as a rule, for maneuvering operations based on the execution of a series of strikes by combined arms large units against those enemy groupings which have broken through on various axes, in combination with the holding by a comparatively small part of the forces of certain important areas of terrain on the basic axes of his offensive. In this, the holding of certain areas of terrain must serve to exhaust the enemy, slow down the speed of his advance, and force him to deploy into combat formations and to set up compact groupings of troops within a limited area in order to destroy them subsequently by nuclear weapons.

Modern operational defense cannot be stable in the former interpretation of this term, i. e., based on holding at any cost a definite line prepared in advance. We consider stability in modern operational defense to be a capability to slow down the speed of an enemy offensive, exhaust his groupings in maneuvering battles, delay his forward movement into the depth of an area being defended, and create conditions to inflict decisive destruction on him by nuclear weapons, followed by final routing of the enemy by strikes of the combined arms large units.

Slowing down the speed of an enemy offensive must be based on holding only certain important areas of terrain, on counterattacks and counterstrikes delivered precipitately and from various directions, on the extensive use of obstacles, primarily antitank ones, and the utilization of natural barriers until such time as the possibility of routing the enemy with nuclear weapons presents itself.

Based on the above, we feel that it is necessary to reject defense zones (as a system of engineer preparation of the terrain), and to construct defense on the principle of creating the defense zone of an army and a front (within their boundaries), individual defense areas with a capacity of not more than a division, intercepting the most probable axes of an enemy offensive, and ensuring the execution of a broad maneuver by the troops. In this, the disposition of forces and weapons in defense, the organization of the system of fire, and the

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

engineer preparation of the terrain in the defense areas of large units, must not so much ensure the holding of the most important key points in the paths of the enemy offensive by repelling his strikes with fire from the halt, as permit maneuvering of forces, especially of the tank subunits and units, in order to conduct counterattacks against an enemy which has effected a breakthrough.

In a number of instances a defense area can be designated not only for a largeunit but also for an army as a whole, especially when it shifts to the defensive during a front offensive operation. Thus, often an army will be forced to shift to the defensive under conditions when part of its forces (individual large units) are continuing offensive operations up to a definite line, certain large units under enemy strikes shift to the defensive, a part of the reserves are thrown into combat with his airborne forces, and on the whole the troops of the army are carrying out combat operations over a wide area, with exposed flanks and having large gaps in the operational formation. Under these conditions, the efforts of the troops of the army in repelling enemy strikes will be directed not only toward the front, but also toward the flanks, and in a number of cases, toward the rear area as well. Therefore, it may not be always advisable to determine a defense zone for an army which is shifting to a forced defensive during an offensive operation, as was done in the past, but sometimes it will be more advantageous to assign it a defense area in which it must halt the advance of the counterattacking enemy groupings, inflict decisive destruction on them, and in this way support the offensive of the main forces of the front on other axes.

The grouping of forces and weapons of a front and army to carry out a defensive operation (operational formation) will now include: a grouping of the missile troops, the first echelon, a strong combined arms reserve (and in certain cases also a second echelon, especially in an army), a grouping of forces and weapons of the antiaircraft defense, special reserves, and in a front, even a grouping of combat, special, and transport aviation. In addition, the operational formation of the troops of a front and of an army

1.3(a)(4

[redacted]

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

should also include, in our opinion, their rear services, i. e., large units, units and establishments designated for uninterrupted materiel, technical, and medical support of troop operations and also forces and weapons for their protection and for defense of the rear services.

A qualitatively new element in the operational formation of the troops of a front (army) is the grouping of missile troops, which will perform the main tasks in the destruction of the enemy. Strikes by missile troops using nuclear weapons combined with strikes by aircraft will now make up the basis of a system of fire which will ensure quick destruction of the enemy on any axis.

The grouping of missile troops of operational-tactical designation must, in all cases, ensure the delivery of massed nuclear/missile strikes in short periods of time against the enemy's weapons of nuclear attack and against his main groupings, primarily of armored troops, in order to rout them by nuclear strikes and frustrate an offensive, and also ensure the capability of rapid retargeting of the main nuclear/missile weapons to fulfill newly arising tasks during the operation.

In shifting to the defensive, the most important task of the command and the staffs is to ensure the timely movement and deployment of missile large units and units in siting areas. In selecting siting areas, both primary and alternate preference must be given to the missile troops over the other large units. The movement of missile large units and units to siting areas is calculated in such a way as to give them the necessary time for deployment of combat formations, preparation (oborudovaniye) of positions, and preparation (podgotovka) of missiles for launching.

The grouping of combined arms large units and formations, its composition, tasks, and designation will be determined by the composition of the grouping of the missile troops and its capability to perform the basic tasks in destroying the enemy.

In creating a grouping of combined arms large units and formations the following two circumstances must be taken into consideration.

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

Firstly, to accomplish tasks of completing the rout of an enemy who has broken through to the depth of the defense, on whom the missile troops have inflicted heavy destruction, and who is sustaining systematic nuclear/missile strikes, there will be no need to have the same number of combined arms large units and formations in the composition of a front, as was the case, for instance, in the past war. These tasks can be fulfilled successfully with an even smaller number of large units (formations).

Secondly, success in combat with enemy groupings whose breakthrough into the depth of the defense is possible on several axes, and with his airborne forces deep in the rear area, can be expected only when the greater part of the motorized rifle and tank divisions are located in the depth at various distances from the line of the front, in constant readiness to deliver strikes against an enemy who has broken through, deploying for this precipitately, or to hold, with a part of them, advantageous areas of terrain on the most probable axes of the enemy's offensive. Under favorable conditions, these large units can also be utilized for a subsequent shift to the offensive. In the first echelon of armies, it is advisable to have a small number of divisions to organize the defense of the most important areas on the probable axes of the enemy's offensive.

A system of engineer preparation of the terrain is set up to correspond to the grouping of forces and weapons which is created to conduct a defensive operation. It will include: the siting areas of the missile troops, the defense areas of the large units of the first echelon, the areas of disposition of the large units of the second echelons and reserves, their routes of movement for maneuver and lines of deployment, the areas where aircraft are based, sectors of obstacles and demolition, areas which have been prepared for the location of control points and rear area installations, the road network, and also dummy positions (areas) and other installations.

The positions of the missile troops are selected on terrain having natural concealment, a developed geodetic grid, and convenient routes for supply and maneuver. In size, the siting areas of the

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

missile troops must ensure the capability of preparing primary and alternate launch sites, containing all the defensive structures needed for concealed and dispersed disposition of units and subunits and stockpiles of missiles, nuclear charges, and fuel components.

In the defense areas of large units of the first echelon, a system of centers of resistance (strong points) is created, in which positions for fire weapons, shelters for personnel and combat equipment, observation posts, and communication trenches are prepared. The centers of resistance (strong points) are linked with the system of artillery fire and are protected by obstacles.

The engineer preparation of the areas of disposition of large units in the second echelon and in the reserve is calculated not only to ensure cover for the personnel and combat equipment of units and subunits, dispersal of them, and repelling by them of an attacking enemy by fire from the halt, but mainly to execute rapid maneuver in any direction. These areas should be selected with consideration for the most probable directions of enemy breakthrough into the depth and for the conditions of the terrain, and whenever possible should be tied in with the system of fire of the missile troops and artillery and, when needed, with obstacles. In the areas, centers of resistance, positions for fire weapons, and cover for personnel and combat equipment can be created and routes of maneuver can be prepared or staked out. For large units of the second echelon and for the reserve, alternate areas must also be designated, for which it is advisable to accomplish engineer preparation in the same manner as for primary ones, if time is available.

Under conditions when the attacking enemy strives to create zones of radioactive contamination and destruction, primarily on the routes of troop movement, advance preparation of the routes (cross-country routes) for the maneuver of troops acquires paramount significance. Engineer troops which have been previously allotted to the complement of traffic support detachments (otryad obespecheniya dvizheniya) are usually used to provide roads and river crossings for maneuvering troops.

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

The system of obstacles, contamination, and destruction is prepared in strict accordance with the disposition of groupings of friendly troops and the planned maneuver, taking into account the terrain and the need to cover the most important axes as well as the intervals and gaps in the defense. In many cases, it may prove advisable to create solid zones of contamination and destruction ahead of the front of the attacking enemy by nuclear weapons for the purpose of halting his forward movement, inflicting losses, and gaining time for the transfer of forces to this axis.

The obstacles created by the engineer troops must be set up quickly, and, when possible, be controlled from a distance, although it is not mandatory to cover them with small arms and artillery fire; on the contrary, it is more advantageous to prepare obstacles on those axes where there is insufficient firepower and personnel. To ensure speedy setting up of obstacles, it is desirable to equip the engineer troops with helicopters. Mobile obstacle detachments, in helicopters, can be widely employed during a defensive operation.

The main element in the engineer preparation of terrain is the concealment of personnel and combat equipment in their dispersed disposition over a large area [redacted] by carrying out various deceptive measures, including the creation of dummy installations and by wide maneuver, preventing the enemy from detecting one or another grouping of troops, especially missile troops. Today, the weak spot in defense will be that grouping of troops which the enemy detects and against which he delivers a strike by nuclear weapons, and conversely, the strong spot in defense will be the grouping which is not discovered by the enemy, and therefore is able to launch surprise strikes against him, primarily nuclear/missile.

The fire system in defense is based on strikes by nuclear/missile weapons, [redacted] which are combined with fire from tube and rocket artillery, strikes by aircraft, and the system of obstacles. The fire system should ensure a capability of concentrating nuclear/missile and aircraft strikes in a short period of time on any threatened

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

axis with the aim of destroying the enemy's nuclear weapons and other weapons of mass destruction and destroying his troops in their areas of disposition during their move forward and at the beginning of their offensive.

Tank fire is of great importance in defense. Tank units, conducting fire from concealed firing positions, can perform several fire missions to destroy and neutralize an enemy which is located within their range of fire, which is very important under conditions when there is a limited amount of tube and rocket artillery in the armies and divisions.

The system of fire in defense is organized in such a way as to increase continually the fire effect on the enemy in proportion to his concentration and deployment, and to make possible the rout of his groupings and frustration of the offensive. In organizing a fire system, primary attention should be given to ensuring the readiness of the missile troops and aviation to deliver nuclear strikes first of all against the enemy's weapons of nuclear attack and basic groupings before the beginning of his offensive. In connection with this, the readiness of the operational defense as a whole will be determined first of all, by the readiness of the missile troops to deliver strikes against the enemy and, if necessary, to retarget them to any threatened axis during an operation.

In our opinion, the greatest attention in problems of conducting modern operational defense should be given to the carrying out of counterpreparation and counterstrikes.

It is known that in the past, counterpreparation, as an active fire countermeasure, directed at frustrating an enemy offensive, was carried out immediately before the enemy shifted to the offensive when his strike grouping was already concentrated in compact formations, usually on one of the decisive axes in direct contact with the defending troops.

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

To carry out counterpreparation against such a grouping, the defender, in turn, concentrated the greater part of the artillery from the complement of the first and second echelons on the axis of the probable main strike of the enemy, brought in artillery from adjacent sectors, and utilized aviation.

During the counterpreparation, only the large units of the enemy's first echelon were subjected to more or less heavy fire effect, and even these quickly reorganized themselves, and after an insignificant period of time, calculated in hours, shifted to the offensive. In regard to the reserves and second echelons of the enemy, on the whole they were not subjected to any serious fire effect and in all cases were utilized according to plan, the defending troops accomplished their destruction during the actual defensive battle.

Now the task of frustrating an enemy offensive can be fulfilled with incomparably greater effect by missile troops who, within short periods of time and without changing firing positions, are capable of concentrating nuclear strikes on any area of disposition of the enemy. Under modern conditions, we cannot count on the enemy to concentrate his groupings in area limited in size, in compact formations, and in direct contact with the defending troops. To wait while the enemy prepares his own offensive groupings for operations, and moreover, to give him the opportunity to deliver pre-emptive strikes by nuclear weapons, means to give up the initiative to the enemy without a struggle and to place our own troops under the threat of defeat in advance. To prevent this, it is necessary to make maximum use of the capabilities of the missile troops.

Combat with the enemy with the aim of frustrating his offensive must be carried on for the duration of the entire period of his preparation for an offensive. This combat will be initiated by the delivery of nuclear/missile strikes, supplemented by aircraft strikes immediately as the enemy's groupings are successfully detected and must continue without interruption. In all cases, it is imperative to strive to deliver strikes, first of all, against the

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

enemy's weapons of nuclear attack, whose destruction will deprive him of the capability of utilizing his ground forces with the greatest effect.

Taking the above into account, we consider the use of the very term "counterpreparation" to be inadvisable because this may lead to adapting the old methods of its organization and execution to the new powerful weapons of destruction.

Modern defensive operations will begin with combat operations, primarily of the missile troops, who can successfully wage combat with the enemy even on distant approaches to the defense. In addition to the missile troops, aircraft using nuclear warheads and other weapons of mass destruction and, on the nearest approaches to the defense, tube and rocket artillery, and some of the tanks, are used in operations to frustrate an offensive which is being prepared.

The decisive role in frustrating an enemy offensive belongs to the missile troops of operational-tactical designation. The objectives of their strikes will be weapons of nuclear attack, groupings of ground troops (mainly armored), depots and workshops for assembling nuclear warheads, control points, and radiotechnical means located in the entire depth of the operational formation of the enemy's troops. To destroy the indicated objectives, the missile troops can deliver individual, group, and sometimes even massed nuclear/missile strikes, supplemented by aircraft strikes against these objectives.

With the sharply increased capabilities of the front and army to frustrate an enemy offensive by nuclear/missile strikes, the task of delivering a strike ahead of the front of the defense by the forces of the combined arms large units, has become more realistic. If the situation permits, it may be advisable, following the successful delivery of massed nuclear/missile strikes, to deliver a strike before the front of the defense by the forces of the large units located in the second echelons of the armies and in the reserve of the front with the aim of completing the rout of the strike groupings of the enemy and the capture of important areas.

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

In many cases, this strike may develop into a general offensive.

In examining the methods of conducting counterstrikes during a defensive battle, it is necessary to proceed, first of all, from the changed nature of the offensive operations of the enemy, who has great capabilities for using nuclear/missile weapons and for conducting large-scale offensive operations. Under conditions when the enemy is making decisive use of nuclear weapons in the entire depth of the defense and is shifting to the offensive on several axes while simultaneously making several landings of airborne forces in the operational rear, deep breakthroughs by his strong groupings of armored troops are possible. We can no longer count on successful combat with these groupings by conducting counterstrikes in their former sense, when large groupings of troops were concentrated on one axis to carry them out.

This was possible before because the enemy also operated with a strong grouping of his troops usually on one decisive axis. By concentrating the main forces and weapons on this axis the defender forced the attacker to gnaw through the defense at a relatively slow pace, as a result of which he had more or less considerable time available for planned preparation and concentration of the counterstrike grouping, without fear that the enemy would decisively disrupt its combat effectiveness before the beginning of operations. At the present time, the situation has undergone a marked change. Despite this, in the practice of major troop exercises, it is possible, even now, to encounter cases when a strong grouping of troops is moved up to carry out a counterstrike on one of the axes and after fire preparation simultaneously /several words missing/ one or another combined arms large unit, being used to carry out the counterstrike is late in moving up to the line of deployment, other large units usually bide their time, thus condemning themselves to passiveness. The enemy, on the other hand, is enabled to reorganize himself and to deal with the counterstrike grouping which has been readied with nuclear weapons. Similar activities were observed even at the last major command-staff exercise which was conducted in July 1960.

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted] 1.3(a)(4)

At the present time, it is very dangerous to concentrate a grouping of troops consisting of three or four divisions on one axis. This only plays into the hands of the enemy, who, in all cases, will be striving to compel the defender to concentrate such groupings within a more or less limited area and to finish them off with nuclear weapon strikes.

Under conditions when, from the very beginning, combat operations develop in great depth and over a wide front, assume a highly mobile nature, and proceed very irregularly, when several strong centers of combat are formed in the defense zone of an operational formation simultaneously on a number of axes and at varying depths, the methods of conducting counterstrikes must be changed.

At the beginning of a defensive battle, the missile troops will deliver nuclear strikes against the enemy to inflict maximum losses on the enemy's defensive groupings and to prevent their breaking through to the depth. A portion of the combined arms large units will conduct sustained combat operations to hold the most important areas, repelling the enemy's offensive by all types of fire and by counterattacks; the other portion of the large units is thrown into combat with the enemy's airborne forces. A large part of the motorized rifle and tank divisions will be used to deliver strikes against enemy groupings which have effected breakthroughs on various axes into the depth of the defense. It is advisable to deliver these strikes precipitately on several axes at various depths, and possibly at various times, especially in the front. However, all the strikes must be united by a single concept to complete the rout of that enemy grouping which at the given time represents the greatest danger with the use of the main forces.

To effect rapid elimination of destruction on the routes of troop movement, it is advisable to set up in each large unit several small, but highly productive and mobile traffic support detachments which are now becoming a necessary part of the march formation of large units and units. The delivery of strikes against an enemy who is making a breakthrough by the combined arms large units on various axes and at varying depths leads to dispersion of the enemy's efforts.

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

With the systematic use against the enemy of nuclear/missile weapons and aircraft, he will hardly be capable of delivering effective strikes on all axes against large units which are moving. Even if the enemy succeeds in disrupting the combat effectiveness of certain divisions, other divisions nevertheless will still be able to deliver strikes against him that will have considerable influence on completing the rout of an enemy who has broken through into the depth.

During a defensive battle, strikes (counterstrikes) will be delivered not only on the enemy's flank, but also from the front because the situation will not always allow the execution of a maneuver to reach the flanks of the groupings which have broken through. Moreover with the timely and successful delivery of nuclear/missile strikes against the enemy groupings which have broken through, it is possible to achieve decisive destruction of them, and, in a short period of time, to create favorable conditions for the execution of frontal counterstrikes.

Taking this into consideration, and also the fact that the basis of the combat operations of the troops in a defensive operation as well as in an offensive, is nuclear strikes, rapid maneuver, and swift attacks by tank and motorized rifle units and large units, with the aim of rapid exploitation of the results of nuclear bursts, then meeting engagements and battles become very typical in operational defense. They will arise and be conducted simultaneously or successively, on a number of the most important axes, over a large area along the front and in the depth when there are large breakthroughs in the operational formations of the troops, and also under conditions when there are numerous zones of contaminated terrain and destruction of the most important routes of movement.

Meeting battles and engagements occurring during a defensive operation will be characterized by: the brevity of the time for their organization; the intensity of the combat to seize the initiative, mainly in delivering nuclear strikes against the troops moving up to meet each other; the deployment of large units on dissociated

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted]

1.3(a)(4)

axes at various times and in varying depth, and also their entry into battle rapidly after the nuclear strikes; the speed of the combat operations; the wide use of maneuver by forces and weapons.

A striving to forestall one another in the use of nuclear weapons may lead to a situation by the time of the encounter, where neither of the opposing sides will have a clearly evident advantage in number of combined arms large units. Therefore, pre-emption in the use of nuclear weapons will be the main condition determining success in a meeting engagement.

The simultaneous inflicting of decisive destruction on several or a large part of the combined arms units which are moving up or being deployed may force one of the sides to shift to the defensive in a short period of time or to withdraw in the face of the evident threat of a rout of its troops. In this case, the outcome of a meeting engagement may be predetermined even before the encounter of the main forces of the sides, and the meeting engagement will quickly develop into an offensive or pursuit for one of the sides and defense or withdrawal for the other.

Such, in brief, are our views on certain problems in the formation and conduct of modern operational defense, which urgently require further investigation.

2 April 1962

MEMORANDUM FOR THE RECORD

SUBJECT: Conversations with [redacted] in London on 8-11 March and in Geneva on 14-25 March 1962 1.3(a)(4)

1. At our meeting on 8 March [redacted] was very pessimistic about the future of the operation and expressed his personal belief that [redacted] had been compromised by overly enthusiastic photographic endeavour, possibly at the Main Artillery Headquarters after BUZINOV'S departure. [redacted] repeated his previously expressed views that the [redacted] meetings were much less likely to have caused trouble, but did admit that [redacted] behaviour at the last two meetings (12 and 19 January) was noteworthy in that it reflected, for the first time, some concern on his part about the security of the meetings. On 12 January, when [redacted] met [redacted] at the Praga and led her to the street and entry which he had selected, he told her that he felt they had been overdoing the shop routine, and that the next time he wanted her to go straight to this same doorway. On 19 January, when [redacted] came down the street and started to enter the designated doorway, she saw [redacted] in the phone booth directly across the street making (or pretending to make) a phone call. He was in a position to see the length of the street in both directions. [redacted] joined [redacted] in the entryway a short time later and the meeting took place as already reported, without any comment on his part as to why he had been in the phone booth. [redacted] left first and has not seen [redacted] since. 1.3(a)(4)

2. On 9 March, when we related the substance of the first interview with [redacted] took some pains to review the record in the light of the fresh information and to admit, in effect, that he had been wrong about the risks involved in the street meetings. [redacted] told us that on 19 January, when [redacted] was taking the bus to her ballet class she noticed a car make a U-turn in front of the bus to follow it. This was the first and only time that she noticed anything that might be construed as surveillance of her. (She did not observe any surveillance when she went from the ballet class to the meeting with [redacted] 1.3(a)(4)

3. In subsequent discussions at Geneva about future communications with [redacted] on his own initiative took the position that we should abandon street meetings as the primary means of contact with [redacted] and that we should accept reduced production as the price of increased security. This, of course, is our own view, and 1.3(a)(4)

APPROVED FOR RELEASE

[redacted] 1.3(a)(4)

[redacted]

[redacted] 1.3(a)(4)

whatever the past difficulties may have been, it appears that we will not have any trouble with [redacted] on this score in the future. It was agreed with [redacted] that both sides would strive to place people in a position to have social and professional contact with [redacted] 1.3(a)(4) that we would try to improve the impersonal commo arrangements in the operation [redacted] a more flexible W/T plan, emergency S/W channel, better dead drop, etc.), and that if need be, we would simply be patient during the intervals between [redacted] trips abroad. It was recognized that we might well have some trouble with [redacted] himself when it comes to cutting down personal meetings in the USSR, but it was nonetheless agreed that we would do everything possible to achieve this.

5. [redacted] fully agreed to the revised plan for W/T broadcasts 1.3(a)(4) which we presented.

6. [redacted] agreed to our proposal that it would be desirable for [redacted] to have a set of prepared postcards which he could mail to accommodation addresses in the U.K. to signal certain key situations. To forestall [redacted] objections to the use of his own handwriting, 1.3(a)(4) these postcards would be furnished him with cover texts already written in (in English). Each postcard would stand for one simple message, the key to which could be the signature, the picture on the postcard, the accommodation address, or any other identifying mark agreed on with [redacted] It was tentatively agreed that the following messages were the most important:

a. "I am under suspicion."

b. "I am on an internal trip."

c. "I am ready to do business again."

d. "I will be coming to the West soon." (10 days notice)

Appropriate picture postcards were selected, and [redacted] undertook 1.3(a)(4) to have a batch of them prepared with various British handwritings and innocuous tourist texts to several accommodation addresses in the U.K.

Planning the Utilization of Nuclear/Missile Weapons in a Front Offensive Operation

by

Colonel-General V. Chizh

As is known, modern operations are characterized by the large scale utilization of nuclear/missile weapons, by highly mobile troop operations, and by sharp and rapid changes in the situation. The mass employment of nuclear/missile weapons promotes a more rapid attainment of operational goals than has been the case in the past. There is every reason to suppose that the duration of operations will be sharply curtailed. In any case, the protracted battles, lasting many days, which were characteristic of the Second World War have, we consider, become a thing of the past. According to the experience of a number of exercises, a front offensive operation will continue for an average of 8 to 10 calendar days.

Along with a significant curtailment in the duration of conducting an operation, its depth will increase sharply. Whereas in the last war the depth of a front offensive operation was within the limits of 250 to 300 km and only reached 500 km in exceptional cases, under modern conditions a front operation will be conducted to a depth of 800 to 1000 km. Such depth can and must be attained mainly as a result of the decisive exploitation of the results of nuclear/missile strikes. At the present time, the problem of increasing the rates of troop advance to 100 km in one calendar day has already been raised. High rates of advance will now play a decisive role in the attainment of operational goals.

However, in spite of the recognition of the dominant role of nuclear weapons, we still do not fully take into account all their capabilities in planning operations. We have cases in which many problems in the preparation and conduct of modern operations are decided from the standpoint of the past with insufficient regard for the particular features of a nuclear/missile war. The nuclear warheads released for an operation will, as the Minister of Defense

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

points out, often be hastily expended as quickly as possible by using obsolete methods of artillery preparation against insufficiently reconnoitered targets.

The enormous role of the new means of combat, which they can play in a future war, requires a new approach to the planning of their use. With the modern scales of using nuclear/missile weapons, they should not be looked upon as a means for supporting the combat operations of ground troops. Now, these weapons are the main and decisive means of combat, determining the possibility of accomplishing the majority of the tasks confronting the troops of a front in an offensive operation. Consequently, problems of the employment of nuclear weapons play a determining role in the planning of a front offensive operation.

The operational directive of the General Headquarters of the Supreme High Command on its conduct serves as the organizational impetus in the planning of a front offensive operation. Following the directive, after he has understood the task and has carefully appraised the situation, the troop commander of a front reaches an operational decision in which, in relation to the use of nuclear weapons, he defines:

--the aims and tasks for which nuclear/missile weapons are to be used in the operation and the allocation of nuclear warheads in accordance with the operational tasks;

--the objectives to be destroyed by nuclear weapons, and the sequence and timing for the delivery of nuclear strikes against them;

--the number of nuclear warheads allocated to the armies for the operation and the order of participation of the army missile units in the massed nuclear strikes of the front;

--the primary and alternate siting areas of the front's missile large units (units) and the airfields at which the delivery aircraft of the air army are based, the sequence and timing of their employment; the order of movement of the front's means for using nuclear weapons during the operation;

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

--the readiness periods of the missile units and aircraft for the delivery of nuclear strikes;

--the reserve of nuclear warheads;

--the measures for material-technical and combat support and other problems.

The authors of some articles, in considering the problems of planning an operation, express the opinion that, in connection with the appearance of nuclear/missile weapons in a front and army, two plans should be worked out: a plan for the front (army) offensive operation and a plan for the utilization of nuclear/missile weapons in the operation.

We share the point of view of Colonel-General Ye. Ivanov and consider with him that there can be no separate plan for the utilization of nuclear/missile weapons. Nuclear/missile weapons and combined-arms large units and formations cannot be used when isolated from one another. The main elements in the operational formation of the enemy's troops will be destroyed by nuclear/missile weapons, and, as is known, the combined-arms large units will complete their rout. Operations by ground troops are now impossible under any conditions without the aggressive use of nuclear/missile weapons in both operational and tactical elements. The basic problems for decision by the troop commander of a front on the operational use of nuclear weapons must be reflected in the plan for the front's offensive operation. The various special technical problems connected with the preparation and the delivery of nuclear strikes which do not come into the operational plan are reflected in the appropriate plans of the chief of the missile troops and artillery of the front (army) and of the commander of the air army.

In our opinion, it is necessary to introduce clarity into the problem of who must work and on what in planning for the use of nuclear/missile weapons in a front (army) offensive operation.

It is known that the main role in planning for the use of nuclear/missile weapons is played by the operational directorate (department) of the staff of a front (army), the staff of the missile troops and artillery of the front (army), and the staff of the air army. Let us examine their functional responsibilities in planning an operation.

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

The operational directorate (department) of the staff of a front (army), on the basis of the instructions of the commander and chief of staff of the front (army), works out the specific problems of the nuclear/missile preparation and support of a front troop offensive, allocates the objectives to be destroyed between the missile troops and aviation, determines the yield of the nuclear charges, the types and height of bursts, the safe distance of friendly troops, estimates the expected results from the nuclear strikes, and keeps a radiation situation map and a record of the irradiation of the large units.

In performing these tasks, the operational directorate (department) coordinates its work with other directorates (departments) and receives from them essential data. Thus,

a. with the intelligence directorate (department), the following are determined in detail:

--the locations of the enemy's weapons of nuclear attack, depots, and assembly bases for nuclear warheads and data on their preparation;

--the disposition areas of major operational reserves, the places in these areas where troops are most densely located, the degree of engineer preparation of the areas, and the probable directions of operations by the reserves;

--the locations of major control points (of armies and groups of armies), the nature and durability of the installations they occupy;

--the procedure for receiving intelligence data before and during the offensive operation, in support of the employment of nuclear/missile weapons.

Data on targets must be presented in the form of the precise topographic-geodetic coordinates of the targets (and not in the form of areas approximated on a map). Only then can the use of nuclear/missile weapons produce the desired result;

b. with the staff of the missile troops and artillery of a front (army) and the staff of an air army, the following are coordinated:

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

--the readiness periods of nuclear warheads for use in combat and their issue to the missile (aviation) large units and units of the front (army);

--the objectives for destruction by the missile units (large units) and delivery aircraft;

--problems in the allocation of nuclear warheads, according to the objectives to be destroyed;

--the timing for the delivery of nuclear strikes;

--the order and periods of time for the dispatch of the missile units and subunits to siting areas and aircraft to dispersal airfields (aerodrom rassredotocheniya) (or maneuvering airfields (aerodrom manevra));

--the system of cooperation between missile units and aviation;

--measures for ensuring the security of friendly troops during the delivery of nuclear strikes;

c. with the chief of the PVO troops of the front (army), the problems of protecting the troops of the front (army), especially the missile units (large units), against strikes by enemy aircraft in areas of concentration and during the operation, are determined in detail;

d. with the chief of engineer troops of the front (army), problems in the preparation of routes, the procedure for supplying troops, and especially missile units, with the elements of prefabricated structures and with other construction materials for the preparation of cover are coordinated;

e. with the chief of communication troops, problems in the organization of communications, primarily with the missile units (large units) and with aviation, are coordinated; in this, communications must be organized down to the duty battery (squadron) inclusively;

f. with the chief of chemical troops of the front (army), problems in the organization of radiation and chemical reconnaissance both by the means of the front (army) and by those of subordinate

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

troops are determined in detail; in addition, together with the operational directorate, the chief of chemical troops collaborates in keeping up the radiation situation map and the record of irradiation of large units; irradiation doses must be considered in an army for the regiment and in a front for the division and for front units (large units).

The staff of the missile troops and artillery of the front (army):

--in conjunction with the intelligence directorate (department), organizes reconnaissance against objectives on behalf of the missile troops of the front (army);

--on the basis of the tasks assigned by the commander of troops of the front (army) to the missile units (large units), allocates nuclear warheads among the missile units and subunits and designates specific objectives to be destroyed by them in accordance with their fire capabilities; conveys tasks to those who are to perform them;

--in accordance with the nature of the objectives designated for destruction, calculates the necessary yield and height of nuclear bursts, ensuring the specified degree of destruction of the objectives;

--organizes the preparation of siting areas and ensures the timely delivery of missiles to the missile units and subunits;

--together with the staff of the rear services decides the question of the procedure for the delivery of missile fuel;

--organizes the tour of duty for launch batteries in the siting areas.

In addition, the artillery staff of the front (army), in planning the combat use of the missile troops, decides such questions as the organization and carrying out of topographic-geodetical preparation and engineer preparation of the siting areas, meteorological support, ballistic and technical preparation; the organization and safeguarding of the movement of the missile units to the siting areas and of their movement during the course of the operation; the organization of direct

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

control of the missile units and of their fire; the clarification of problems of coordination by the missile troops with aircraft and cruise missiles in the joint destruction of objectives.

The staff of the air army:

--allocates nuclear warheads among delivery aircraft and cruise missiles, designates specific objectives for destruction by them and organizes the delivery of nuclear strikes in accordance with the plan of the front's offensive operation;

--makes the necessary calculations (yield and height of nuclear bursts) to ensure the prescribed degree of destruction of the objectives;

--organizes and provides for continuous duty by delivery aircraft and for the timely delivery of nuclear warheads to the airfields on which the aircraft are based;

--organizes direct control of the large units (units) using nuclear warheads and also their combat support and cover;

--clarifies problems of coordination by the aviation units and cruise missile units with the missile units of a front (army) in the joint delivery of nuclear strikes.

The procedure for planning the employment of nuclear/missile weapons in an operation, suggested by us, eliminates the necessity for preparation by the directorates and departments of the front's (army) staff of a series of memoranda and considerations for the front commander.

We have discussed only one side of planning, i.e., we have defined the role of the directorates and departments of the staff of a front (army) and have shown the content of their work in planning for the employment of nuclear weapons in an offensive operation by the front (army).

The other side of planning consists of the resolution of separate problems connected both with direct planning and with the execution of nuclear/missile strikes. Let us examine some of these:

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(e)(4)

[redacted] 1.3(e)(4)

In the allocation of nuclear warheads for the tasks of the operation and in the designation of specific objectives for destruction by them, it is necessary to proceed from a basic rule: it is better to destroy a smaller number of objectives with certainty, but those that are more important and have been well reconnoitered, than to hit at all or a large portion of the objectives without attaining the required result in doing so.

According to the experience of a series of exercises, nuclear warheads can be allotted for tasks as follows: for the first mass nuclear/missile strike (for the conduct of fire preparation)--20 to 30 percent; for accomplishing the immediate task of the front--30 to 40 percent; for accomplishing the subsequent task of the front--20 to 30 percent; for the front's reserves--10 to 20 percent. Of course, this is a most tentative calculation. The specific allocation of nuclear warheads in accordance with the tasks of an operation must be made according to the actual situation.

The nature of the objective and the particular features of the disposition of its separate elements have an exceptionally important significance in determining the type, amount, and yield of the nuclear warheads needed for its destruction. For example, the enemy's weapons of nuclear attack, battalions of "Honest John", "Corporal", "Redstone" and of many other weapons, can be deployed in concentration areas or assume combat formation, with their launching mounts, at the waiting or launch sites. The most profitable objective for a nuclear strike will be a concentration where these weapons are located more compactly and for a longer time. The destruction of weapons of nuclear attack at their launch sites will be impossible in most cases because of their short stay at these sites.

In all cases, one must strive in the first instance to destroy depots of nuclear warheads and their assembly bases, and also the radio-technical means of control and guidance of missiles, without which the launching mounts are nothing more than heaps of metal.

In the allocation of objectives for destruction to the various means of delivering nuclear warheads to their target, it is necessary to consider the distance of the objectives from the main line of resistance, the degree of their cover by PVO weapons, and the nature of the objectives (their mobility). The inclination to plan nuclear

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

strikes against mobile objectives beforehand, as was indicated by Marshal of the Soviet Union V. I. Chuykov in his critique of the 1960 command-staff exercises, is nothing more than self-deception.

For the destruction of stationary and relatively immobile objectives, it is advisable to designate missile units, and for the destruction of mobile objectives, aviation. To deliver strikes against objectives located near our troops and also against targets of small dimensions which refer primarily to the enemy's weapons of nuclear attack, it is necessary to select means of destruction which are more accurate in their combat characteristics (cruise missiles and solid fuel ballistic missiles).

In order to allocate objectives for destruction between the missile troops and aviation correctly, it is necessary, first, to consider fully their characteristics and combat potential; and second, from the total number of objectives, which almost always exceeds the capabilities for their destruction, to select the most important, the destruction of which will ensure the attainment of the assigned goals.

In determining the type and height of a nuclear burst it is necessary to consider not only the probability of destroying this or that objective, but also the possibility of radioactive contamination of the terrain in areas in which operations of front (army) troops are impending, as the result of one's own nuclear bursts.

As is known, depending on the location and nature of the objectives (targets) to be destroyed, and also on the level of destruction required, either surface or air bursts can be used.

Surface bursts should usually be planned for the destruction of troops located in solid shelters (dugouts), and also for putting out of commission military-industrial and other objectives with very sturdy structures. In addition, it is advisable to use surface bursts (along with the destruction of the objective) to create zones of radioactive contamination of the terrain, with high levels of radiation.

However, in each specific case it is necessary to consider carefully the meteorological conditions (mainly the wind direction), the location of friendly troops, and their subsequent operations,

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

together with the configuration of the front line. In delivering strikes against objectives located near our troops, surface bursts may be used only when there is a steady wind in the direction of the enemy and under conditions in which troops will not enter these areas before the level of radiation falls to within safe limits.

Air nuclear bursts should be planned for the destruction of troops without cover and also of objectives which do not have sturdy structures. In addition, air bursts are used in all other cases when it is necessary to exclude strong radioactive contamination of the terrain. Low air bursts can be planned when it is necessary to avoid strong radioactive contamination of terrain and, at the same time, to destroy as large a number of sturdy structures as possible.

The solution to the problem of selecting the type of burst to destroy one or another enemy rear area objective also depends on the task which has been assigned. If, for example, it is necessary to put a rail junction out of action for a short time, with the intention of using it subsequently for the needs of the front during the operation, it is more advisable to plan a high air burst.

In conducting an offensive operation, more air than surface bursts are usually planned and in the conduct of a defensive operation this is reversed. In mountains, it is more advisable to use air bursts, because the protective qualities of the ground configuration are thereby lessened.

Timing for the delivery of nuclear/missile strikes. It is known that the greatest effect from nuclear/missile strikes can be achieved if they are delivered simultaneously, or within a strictly limited time. Therefore, the troop commander of a front establishes the timing for a simultaneous nuclear strike against the target by all nuclear warhead delivery means. In accordance with this timing, the staff of the missile troops and artillery and the staff of the air army must calculate the time at which each missile (aviation) unit (large unit) should begin launchings (strikes), separately. The staffs of the missile and aviation large units (units), depending on the flight-time of the missile (delivery aircraft) to the target, calculates the launch-times for each launch assembly (take-off time of delivery aircraft).

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted]

1.3(a)(4)

1.3(a)(4)

The timing of nuclear/missile strikes during an operation is calculated so as to deliver the greatest destruction against this or that enemy objective. For example, it is most profitable to destroy infantry and tank groupings at the moment when they are deploying for a counterstrike or in concentration areas when they leave cover and prepare to move. It is advantageous to destroy airfields at which delivery aircraft are based at the moment when the greatest number of aircraft has built up or when nuclear bombs are being loaded, etc.

It is thus, in our opinion, that the planning for the use of nuclear/missile weapons in an offensive operation by a front (army) must be carried out.

Following is a verbatim translation of an article titled "Urgent Tasks for the Improvement of Aerial Reconnaissance Under Modern Conditions", by Colonel-General of Aviation S. Mironov and Major-General of Aviation M. Mukhin.

This article appeared in the 1961 Third Issue of a special version of the Soviet military journal Military Thought (Voyennaya Mysl). This journal is published irregularly and is classified TOP SECRET by the Soviets. It is distributed only within the Ministry of Defense down to the level of Army Commander. The 1961 Third Issue was sent to press on 10 July 1961.

Urgent Tasks for the Improvement of Aerial Reconnaissance Under Modern Conditions

by

Colonel-General of Aviation S. Mironov
Major-General of Aviation M. Mukhin

It is generally known that the degree of troop control is directly dependent on the timeliness with which the various command echelons of the armed forces receive necessary intelligence information.

The demands of military art for all types of intelligence are constantly increasing in proportion to changes in the nature of armed combat, and the equipping of troops with the newest types of weapons and combat equipment. This emphasizes the problem of further technical improvement of the present means of reconnaissance and the creation of new models of reconnaissance equipment.

On the basis of a study of experience from the combat training of troops and the state of the means of reconnaissance, it can be said that the troop demands levied on the organs and means of reconnaissance significantly exceed the capabilities of the latter. This pertains mainly to aerial reconnaissance, the status of which causes us particular alarm.

Aerial reconnaissance performs its tasks with the aid of a whole complex of various technical means which are organically inter-connected and which together constitute a single intelligence system.

It is necessary to consider the vehicles of reconnaissance equipment as the first element of this system.

Aerial reconnaissance must have at its disposal a great number of sophisticated flying equipment: manned and pilotless, fast and slow, high and low flying and having various ranges of operation. Up to the present, however, we have had only manned aircraft, mainly of obsolete construction (TU-16R, IL-28R, MIG-15R bis), with low performance characteristics and extremely limited capabilities for overcoming an enemy PVO system.

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

The reconnaissance aircraft which are available can only partially perform their tasks. Moreover, their reconnaissance equipment does not provide for detection of small and mobile targets, for determination of their geographical coordinates, or for transmission of information from the aircraft.

The YAK-27R, which is in series production, has limited performance characteristics and the equipment installed on these aircraft permits only visual observation and aerial photography reconnaissance during daylight hours under favorable weather conditions.

The second most important element of the system of aerial reconnaissance means is the complex of technical equipment of reconnaissance aircraft, including reconnaissance, navigational and communications devices designated for detection and identification of targets, determination of their geographic coordinates, and transmission of the intelligence information from the reconnaissance aircraft to the appropriate command posts. It should be noted that the problems of receipt, processing and transmission of intelligence data in short periods of time, and in the necessary volume, are the most complex of all the problems facing aerial reconnaissance.

This is explained by the extraordinary and varied nature of the targets which may be point-like (tochechnyy), of small dimensions, area (ploshchadnyy), aerial, on land (on water), underground (under water), concealed or camouflaged. The characteristics of each type of target exert a great influence on determining the requirements that are levied on the reconnaissance devices: in relation to the capability for long-range detection of targets, the resolving power of the devices, the time for conduct of reconnaissance of a given target, etc.

Aerial reconnaissance can exploit such important characteristics of targets as, for example, the reflection and radiation of electromagnetic waves of various frequency ranges and also the magnetic, ionization and radiation characteristics. Thus, taking into account that the targets of reconnaissance naturally emit electromagnetic waves, radio and radio-technical reconnaissance devices are constructed, and on the basis of exploiting the principle of reflection--aerial photography, television, infrared, radar and other devices are constructed.

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

1.3(a)(4)

At the present time, aerial photography and radio-technical reconnaissance devices have become the basic reconnaissance equipment of our armed forces. Unfortunately, other types of these devices (television, infrared, radar, magnetometric, radiometric, radiational and meteorological) are not sufficiently developed. Individual models of such devices have not yet been perfected and are of little use in obtaining intelligence data.

The inadequate development of the above-listed types of reconnaissance devices seriously limits the capabilities of aerial reconnaissance. The devices of reconnaissance aircraft do not satisfy the requirements of the armed forces as to volume, quality or timeliness of receipt of intelligence information. The degree of automation of airborne reconnaissance devices is extremely low and special operators are needed to operate them in flight. Night photography is limited because airborne lighting means have not been perfected. It is possible only after lighting the terrain with photobombs, as a result of which the number of aerial photographs is limited by the supply of photobombs on board. There are no electrical lighting devices in the equipment of our units for taking night photographs of targets from various altitudes.

The radio-technical reconnaissance equipment does not ensure complete detection of the enemy's radar networks, particularly of the stations for controlling missile weapons. The handling capacity of the equipment is low. As a result, an experienced operator, in one flight in a TU-16R with an SRS-1 station, is capable of reconnoitering only 8 to 10 ground radar stations. The accuracy of determining the locations of individual radar stations is extremely low: 10 to 20 km.

The processing and interpretation of the results of radio-technical reconnaissance require a rather lengthy period of time.

Intelligence on the enemy's modern radio-technical equipment which operates by rapid bursts or by switch-over of frequencies is practically nonexistent.

The existing means of air navigation do not in fact provide for the necessary accuracy in determining the geographical coordinates of targets, especially under difficult weather conditions and at night, and the navigational problems in long-distance flights over areas without reference points and in northern latitudes are also unresolved.

[redacted] 1.3(a)(

[redacted] 1.3(a)(4

[redacted]

1.3(a)(4)

1.3(a)(4)

The creation and perfection of navigational means which permit accurate geographical pinpointing of targets and the determination of a current position of the reconnaissance aircraft is an independent problem in itself, as is also mastery of the whole complex of reconnaissance devices.

Modern warfare emphasizes the need to shorten, to the maximum extent possible, the intelligence cycle, i.e., from the time of receipt of the initial reconnaissance information to the time of receipt of exhaustive intelligence data by the appropriate staffs. A whole complex of airborne and ground devices is necessary for this.

This problem can be resolved in various ways, for example, by transmitting the initial information directly from the reconnaissance aircraft. Another method is the processing of the initial information aboard the reconnaissance aircraft. A third method envisages having all the reconnaissance information accumulated aboard the aircraft but processing it on the ground after completion of the reconnaissance flight. This method is basically embodied in the existing reconnaissance apparatus since the problems of processing reconnaissance information in flight and its automatic transmission from the reconnaissance aircraft are still unresolved.

The existing ground equipment is not capable of processing and transmitting reconnaissance information in the required volume. For example, the production capacity of the photo-laboratories of reconnaissance units provides for the processing of only 40 to 50 percent of the photographic materials produced by reconnaissance crews during the course of a day. Unfortunately, as yet there has been inadequate development of such highly advanced means of reconnaissance information processing as television, photo-television, aerial photography with processing of photo-documents on board during flight, and also apparatus for the systematic processing of information aboard the reconnaissance airplane with subsequent transmission to the ground.

For a complete resolution of this problem, it is necessary to create ground points for collection and automatic processing of information which is received from strategic, operational and tactical aerial reconnaissance. For transmission of the reconnaissance information to the interested headquarters, it is necessary to introduce television, facsimile and other high-speed means.

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

1.3(a)(4)

An examination of the basic elements that enter into the complex of aerial reconnaissance indicates that each of them presents a complicated scientific-technical problem.

In order to ensure the necessary coordination in the development of aerial reconnaissance means and in the activities of the various organizations conducting work in this direction, it is advisable to concentrate in a single center the processing, development and requests pertaining to all means of aerial as well as satellite reconnaissance. In our opinion, the air forces will most successfully cope with this problem with appropriate guidance from the General Staff. Together with this measure, in order to eliminate more rapidly the existing discrepancy between the capabilities of aerial reconnaissance means and the requirements of modern weapons of destruction, it is advisable to broaden greatly the scope of scientific-research, experimental and experimental-design work in the field of the creation of the latest technical means of aerial reconnaissance. In particular, it is necessary to designate the leading institutes (especially for the development of reconnaissance devices) and to broaden the production base of the industry engaged in the creation of series models of aerial reconnaissance means by widely initiating the production of devices in small series. In this connection, the development and creation of new aerial reconnaissance means should, in our opinion, be considered one of the primary tasks in the field of increasing the combat readiness of all types of armed forces.

In order to ensure timely intelligence data for all types of armed forces, we must solve a number of problems that are connected with determining the numerical composition of aerial reconnaissance forces for peacetime and wartime conditions, the organizational structure of these forces and control over them, and also the development of the most favorable system for the flow of intelligence information from the lowest level to all interested echelons.

In considering the necessity for maintaining a high degree of combat readiness of aerial reconnaissance, we believe that in peacetime it is very important to have strategic, operational, and tactical means in quantities which will permit the timely detection of the preparations of an aggressor for nuclear/missile attack and will provide all types of armed forces with intelligence data in the initial period of a war. The readiness of the aerial reconnaissance forces must correspond to the combat readiness of our strike forces and above all of our missile troops.

1.3(a)(4)

[redacted]

[redacted]

1.3(a)(4)

[redacted] 1.3(a)(4)

1.3(a)(4)

In view of the fact that in the majority of cases aerial reconnaissance will be carried on under conditions of strong opposition from enemy PVO weapons and will be accompanied by significant losses, it is necessary to envisage the creation of special reserves for the period of the war, including those of the Supreme High Command, which are capable of ensuring reinforcement of reconnaissance forces on the most important axes of operations of our troops. During the course of operations, because of the sharply increased troop maneuverability, aerial reconnaissance must be marked by very frequent observation of (targets), which means conducting a large number of flights by manned and pilotless means.

Research, based on materials from training exercises and maneuvers of our troops, indicates that in the most typical front offensive operation in a developed theater of combat operations against a group of enemy armies consisting of 25 to 30 divisions, it will be necessary to conduct 650 to 700 reconnaissance flights per calendar day. In determining the overall number of aerial reconnaissance forces and means required by a front, it is necessary to keep in mind the fact that the average potential of manned reconnaissance aircraft consists of: 3 flights per calendar day for tactical reconnaissance, 2 flights for operational reconnaissance, and 0.5 flights for strategic reconnaissance.

The new tasks facing aerial reconnaissance also necessitate a change in the form of the structure of the entire intelligence system. In our opinion, the basis of the organizational structure of the intelligence system must be the idea of ensuring centralized direction and use of all forces and means. To accomplish this, it is necessary, along with the GRU, which does not embrace all types of intelligence, to have within the Ministry of Defense a single directing intelligence organ upon which should be levied:

--the working out and improvement of the system of equipping intelligence elements;

--the working out of a single organizational-organic structure of intelligence units and organs;

--coordination of the activities of the intelligence organs of the various types of armed forces and the organization of coordinated operations among them;

--centralized direction of all types of intelligence.

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(e)(4)

[redacted] 1.3(a)(4)

The absence at the present time of such an intelligence organ does not provide an opportunity for the most effective use of our available forces and means of intelligence and is a serious obstacle to the creation of a single intelligence system within our armed forces.

The direction of strategic, operational and tactical aerial reconnaissance with the aim of receiving reconnaissance data for all of the interested echelons should, in our opinion, also be concentrated in appropriate intelligence centers. For this, the forces and means of strategic aerial reconnaissance of the armed forces, including satellite reconnaissance, should be concentrated in a special center of the air force, which would be responsible for providing intelligence data both to the Supreme High Command and to all types of armed forces. The forces and means of operational and tactical aerial reconnaissance should be concentrated in the intelligence centers of air armies (air forces (voyenno vozdushnyye sily--VVS) of fleets or groups of troops) which would be responsible for furnishing intelligence data to the troops of the district (front or fleet).

We consider the introduction of aerial reconnaissance units and subunits into the (TO&E) of combined-arms and tank armies premature for the time being, since a large number of service units and subunits would be required for airfield support. As a result, this would decrease the maneuverability of the combined-arms formations, would result in a dispersal of the already limited forces of aerial reconnaissance, would hinder combat support of the operations of aerial reconnaissance forces, and in peacetime would also significantly weaken the organization of combat training and the direction of reconnaissance units and subunits. As pilotless means for reconnaissance of a field of combat are introduced, means which do not require complicated maintenance, it will be possible to introduce them into the TO&E of combined-arms formations. At the present time, however, combined-arms and tank armies must receive reconnaissance data from the headquarters of the front, which, depending on the combat situation which is taking shape, will carry out operations by the forces and means of aerial reconnaissance on behalf of all troops and in accordance with the goals of the front operation being conducted.

It should be noted that the intelligence organs which exist in the main headquarters of the VVS, the headquarters of naval (voyenno-morskoy flot--VMF) aviation, and in air armies (VVS of districts and fronts) by virtue of their small numbers and organizational

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

imperfection, will not be able to perform the tasks which we propose to levy on the intelligence centers of strategic and operational-tactical reconnaissance. Also, the separate reconnaissance squadrons created in the military districts (groups of troops) instead of aviation regiments, are not capable of fulfilling combat tasks to the required extent, and the extremely limited forces and means of aerial radio-technical reconnaissance are widely dispersed: 2 or 3 aircraft available in the special purpose (osoboye naznacheniye--osnaz) units of districts (groups of troops) and in the reconnaissance units of air armies.

It is perfectly clear that the existing dual subordination of units and subunits of tactical aerial reconnaissance (to the district and to the air army) and the dispersal of reconnaissance means, weakens direction of them and does not permit sufficiently efficient and purposeful organization of cooperation between operational and tactical aerial reconnaissance.

Therefore, it seems to us advisable to create aviation reconnaissance regiments in some military districts (groups of troops) primarily on the main axes, instead of having separate small intelligence subunits in each military district.

The question of having cadres of reconnaissance specialists for intelligence organs and units and subunits of aerial reconnaissance is also very important at the present time.

In connection with the increased demands of modern conditions, specialists of the intelligence organs of all echelons must have broad general and special training. However, this category of officer personnel has not been trained in military educational institutions in the course of recent years. As a result, a significant part of the intelligence organs and staffs of air regiments are still manned with officers who do not have the necessary theoretical knowledge and work experience.

The acute shortage of reconnaissance specialists can be eliminated only by establishing special training on a sufficient scale in the military educational institutions of the country. In addition, in the interests of maintaining permanent cadres of intelligence personnel, it would also be advisable to resolve the question of the material-legal incentives of the personnel of intelligence organs and units.

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

Also of no small importance is the problem of improving the TO&E of reconnaissance units. In aviation reconnaissance regiments, for example, the position of photogrammetric interpreter is usually filled by privates and privates first class who are serving their normal period of compulsory military service. Taking into account that under modern conditions decisions for the use of weapons of mass destruction will be made on the basis of the interpreted materials of aerial photo-reconnaissance, we consider that it is advisable to assign to these positions officer-specialists and soldiers who are serving voluntarily beyond the required period and who possess high qualifications.

In conclusion, a few words about the preparation of intelligence organs and the training of intelligence personnel.

At the present time, the performance of reconnaissance tasks is not being achieved to the required extent because of the extremely limited training facilities, the lack of trained command posts for controlling reconnaissance aviation, the lack of proper opposition by PVO forces and weapons during training exercises, and also because significant limitations in the mode of operation of reconnaissance aircraft in flight cause serious defects in the training of units and intelligence organs.

In order to improve the combat training of intelligence organs and units, it is necessary above all to create an appropriate training facility which will permit the training of units and intelligence organs in the conduct of reconnaissance of weapons of mass destruction and determination of the coordinates of targets with the maximum possible accuracy. In our view, it is advisable to create within the armed forces specialized inter-district firing ranges with control and support means which provide targets which are mobile at firing positions both on the firing ranges and in areas outside the ranges.

In order that reconnaissance units perform their tasks during training exercises under conditions of strong enemy PVO, we feel that it is necessary during the training to create realistic countermeasures by fighter aircraft, by units of antiaircraft missile troops (zenitnyye raketnyye voyska--ZRV), and by radio jamming.

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

And finally, in order to work out, during the course of the training of units, the whole complex of tasks in the collection, processing and analysis of reconnaissance data, and also for the transmission of these in the shortest period of time to the interested headquarters, it is advisable to employ the maximum possible number of reconnaissance units and subunits and the intelligence organs of all echelons in the troop training exercises and maneuvers.

* * *

Speedy resolution of the entire complex of problems facing aerial reconnaissance will ensure the elimination of the gap which has formed between its capabilities and the requirements of the troops. This will increase the effectiveness of the use of the new weapons of destruction and also the combat readiness and combat efficiency of all types of armed forces to a significant degree.

SOURCE : A reliable source (B).

Following is a verbatim translation of an article titled "The Question of Increasing the Stability of Troop Control", written by Major-General of Artillery V. Ilinykh and Lieutenant-General of Communications Troops P. Kurochkin.

This article appeared in the 1961 Third Issue of a special version of the Soviet military journal Voyennaya Mysl (Military Thought). This journal is published irregularly and is classified TOP SECRET by the Soviets. It is distributed only within the Ministry of Defense down to the level of Army Commander. The 1961 Third Issue was sent to press on 10 July 1961.

Headquarters Comment: The article by Major-General M. Ivanov referred to in the first sentence of the attached was disseminated as [redacted] on 5 April 1962. 1.3(a)(4)

The Question of Increasing the Stability of Troop Control

In the article by Major-General M. Ivanov, extremely urgent questions of increasing the effectiveness and stability of the control of troops are raised.[1] In analyzing the existing structure of operational staffs and the requirements levied on them, the author reaches the conclusion that there must be a radical reorganization of control organs, the essence of which consists of the elimination of staffs of arms of troops and certain directorates and the creation in their place of several centers for planning and for troop control. Specifically, he proposes the creation of a nuclear/missile center as the organ for controlling all nuclear means of destruction, i.e., missile troops and the appropriate types of aviation.

In our opinion, it is impossible to agree with the organizational structure of operational staffs proposed by General Ivanov. He bases his thoughts mainly on the necessity for planning and only partially on control, losing sight of the other side of the activities of the chiefs of arms of troops and their staffs, which is training and thoroughly providing for the constant combat readiness of their subordinate units and large units. Even the control of, for example, the missile troops of a front, represents an involved complex of a number of measures.

In addition to this, the consolidated combined arms staff with various centers, which is proposed by the author of the article to replace the presently existing directorates and staffs of arms of troops, is also unwieldy and still does not eliminate the division of duties, and consequently, unavoidably requires appropriate coordination among the centers.

---

1. Special Collection of Articles of the Journal "Military Thought", First Issue, 1961.

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

It is perfectly correct that the element of time has assumed an extremely important significance and that timely collection of the most complete data on the situation, a comprehensive analysis of these, adoption of decisions and transmission of these decisions to the troops, and also control over the execution of these decisions, is required of staffs. However,,all of these tasks can be successfully accomplished with the existing organization of the staffs if certain modifications are introduced.

Preservation of the duties of the chiefs of arms of troops with their appropriate staffs or directorates conforms to the principle of single command and strengthens responsibility not only for planning but also for the training and education of personnel and for the support and thorough training of the appropriate arms of troops. Modern combat equipment is complex and in order to handle it specific know-how is necessary.

In itself, the idea of control of means of mass destruction, i.e., missile troops, aviation, and chemical troops, from a single center is not new. It was implemented in training exercises of the American Army, where a similar center was headed by the artillery commander.

Perhaps, such a system contains certain positive aspects, but to unify the control of missile troops and atomic bomb-carrying aviation is not appropriate, in our view, because control of the latter has its own specific characteristics and is the prerogative of the commander of an air army.

In the practice of combat training, fairly definite views have been worked out for organization of the control of missile troops and atomic-bomb-carrying aviation; they consist of the following.

The commander of the troops of a front determines the target and the procedure for the use of nuclear weapons, allocates missions among the missile troops and aviation and establishes the bases for coordinated action among them, and during the progress of the operation makes decisions concerning the delivery of nuclear strikes.

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

The staff of a front jointly with the staffs of the missile troops and artillery and of the air army develops the plan for the use of nuclear weapons, organizes intelligence, determines the objectives for destruction, determines the yield of the nuclear warheads to be used against them and the types of bursts, and also the time for delivering the strikes.

The chief of missile troops and artillery and his staff must, on the basis of the decision made by the commander of troops of the front, plan in detail the combat use of the missile troops to be used to carry out the overall tasks of the front, and, in an army the overall tasks of the army, allocate fire missions and assign them to those who are to execute them and must organize the tour of duty of launch batteries, the timely delivery of missiles to units and also the preparation of these for launching. During the course of an operation, they execute maneuver by trajectories and the movement of missile units and their supply bases.

In order to control missile troops, it is necessary constantly to know the situation and condition of the missile large units and units and also the availability and degree of readiness of the missiles for launching. Control of missile troops and their fire must be carried out continuously, which can be achieved by means of constant readiness for their control from presently existing forward command posts (peredovoy komandnyy punkt -- PKP) and command posts (komandnyy punkt -- KP) with high operational and technical training of generals and officers, a clear-cut distribution of functional responsibilities with the existence of interchangeability, and also uninterrupted and reliable communications.

As a rule, the control of troops will be conducted from two points; these can be PKP or KP. In this, the personnel must be available at the PKP who are necessary to the commander of troops of the front in the process of working out a decision and in the control of troops, namely generals and officers from the combined arms staff and chiefs of arms of troops, including the chief of missile

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted]

1.3(a)(4)

troops and artillery of the front with a small group of well trained officers. The remaining personnel of the staff and the field control headed by the chief of staff of the front are located at the KP. A constant reciprocal exchange of information between the PKP and KP must be implemented.

In his article, General Ivanov argued sufficiently convincingly for the advisability of having in the composition of the field control of a front and army two independent elements of control. Without raising an objection against this method of resolving the problem of control, we add that, in our opinion, the chiefs of the basic directorates of the staff and arms of troops with small groups of subordinate officers must be located with the commander of troops of a front in all cases, thus permitting rapid evaluation of a situation, adoption of a decision, and issuance of commands.

The opinion of the author of the article concerning the elimination of parallelism in requesting data on a situation is also perfectly correct. Obviously, the introduction of automation into the control of troops will eliminate such defects but even under the given conditions this system needs revision. All information received from the troops must be concentrated in one organ and represented on an overall map or map-screen.

This proposal does not exclude, of course, the necessity for interested command echelons to receive certain special information from directly subordinate troops (for example, for the staff of the missile troops and artillery to receive data on the movement of missiles and their degree of readiness for launching).

As is known, in view of the use of nuclear/missile weapons, the significance of intelligence has increased sharply, especially the timely receipt of reliable data. And in this regard we are in full agreement with General Ivanov, that the accomplishment of all tasks facing intelligence, primarily those on behalf of the use of nuclear/missile weapons, requires its centralization.

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

Does the necessity for the staff of the missile troops and artillery to have its own intelligence department no longer exist? No, it still exists. In our view, it is needed in small complement, in particular for the organization and execution of preliminary reconnaissance of targets prior to delivery of a nuclear strike, and also for the organization of control, topographic-geodetic support, and other work. But its activities must be coordinated by the chief of intelligence of the front.

As a whole, in our opinion, the questions raised by General Ivanov regarding the reorganization of methods of control of troops merit further discussion.

Major-General of Artillery V. Ilinykh

* * *

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(e)(4)

[redacted] 1.3(a)(4)

In our opinion, the article by Major-General M. Ivanov reflects correctly the deficiencies in the organizational structure of the staffs of operational formations, in the methods of control of troops, and in the organization of control points, and the author's practical proposals do not raise any fundamental objections.

However, in our view, one can approach a resolution of the problem of increasing the stability of troop control most correctly not from an examination of the organizational structure of staffs as does General Ivanov, but from a thorough analysis of the methods of control of troops and combat weapons, upon which in turn will depend the structure of the control organs.

New weapons of armed combat, and the nature of conducting combat operations corresponding to them, have a strong influence on the methods of control of troops and combat equipment, and the latter in turn makes definite, perfectly specific demands on the organizational structure of the organs and means of control. The anti-aircraft defense of troops, for example, requires such methods and means of control as to ensure the timely transmission of data on current aerial targets directly to the combat weapons, the instantaneous aiming of these weapons at targets which have been discovered, putting the combat weapons into action, and effectively destroying the target. As we see it, the main role belongs to the actual method of control.

The requirements on the organs of control which are listed in the article amount, in essence, to control over the readiness of combat means, regulating the activities of the commanders of arms of troops and the chiefs of special troops, and ensuring more purposeful work by appropriate departments in the collection and processing of operational information. These requirements are correct,but they do not include the main condition emanating from the use of modern combat weapons and from the nature of the conduct of combat and operations.

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

The main element, in our view, is the fact that the control of troops, weapons, and equipment must ensure effective results from the use of all weapons of armed combat, primarily of nuclear/missile weapons, antiaircraft missile weapons, and the system of antiaircraft and antimissile defense as a whole. On this basis, particular requirements for the control of troops are determined. Besides those indicated by General Ivanov in his article, we should like to bring up some new ones in addition, such as:

-ensuring speedy reaction by the commander and staff to events (phenomena) as they occur, which depends, on the one hand, on the use in combat and operations of rapid-fire combat weapons and troops possessing high speeds of movement and, on the other hand, on the necessity for counteracting an enemy who has similar forces and weapons;

-ensuring maximum expediency in decisions and precision in the operations, especially of nuclear/missile weapons, the system of antiaircraft and antimissile defense, airborne troops and radio countermeasures means;

-ensuring thorough control over the timely readiness of nuclear/missile weapons, means of antiaircraft and antimissile defense, and also over the operations and situation of friendly troops and their materiel and technical support.

In our opinion, the requirement for control organs advanced by the author in regard to the concentration of data on the situation in one point (center) should be broadened. It is necessary to ensure the timely collection and processing and the reliability of information on the condition of combat weapons, troops, materiel and technical reserves, intelligence information on the enemy (in the first order, on objectives for nuclear strikes), and data on the radiation and chemical situation. Under modern conditions, the versatility and volume

[redacted] 1.3(a)(4)

of the information which characterizes the combat situation, the increased number of directions from which it is received, and the sharp expansion of the area within which it is necessary to collect this information is noted. In addition, the collection and processing of information must be accomplished in very limited periods of time, consisting,in many cases,of minutes and even seconds.

We fully agree with the opinion of General Ivanov concerning the necessity for stricter centralization of troop control as a whole, including centralization of planning, control of fire weapons, and collection and processing of operational information, but we do not share his point of view on the composition of the field control of a front (army).

In our view, the creation of two separate centers, a main command-planning center and an operational center, is contrary to the concept of centralization of the control of troops. In essence, one center plans, and another concerns itself with the collection of data and directs combat operations. This can lead to parallelism and to the necessity for coordinating the work of these two centers and,in the final analysis, to loss of time. Would it not be better to have one center, an operational directorate (department), whose functions have been broadened in the sphere of unified planning,and the collection and analysis of all information on the situation of friendly troops and on the results of the use of nuclear weapons,and in the transmission of all instructions based on the plan for the operation,and on the progress of combat operations? In this situation, the concept of centralization of control will be effected more fully and the necessity for coordinating the work of both centers will no longer exist.

The designation "nuclear/missile center" also warrants comment. In proposing the formation of such a center, General Ivanov indicates that "the nuclear/missile center will be a unified organ for controlling the weapons of destruction of the front. All weapons

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

of nuclear attack must be concentrated in the hands of the chief of this center, i.e., missiles of all types, bomber aviation and others, which will undoubtedly improve and expedite their use". It appears to us that it would be more correct to call such a center the "fire and chemical center" which will more fully reflect the content of its work.

In the composition of the field control of a front (army) proposed by the author of the article, a highly important organ is omitted, the communications directorate (department). Without this organ, none of the indicated centers can operate. To assign the organization of communications to each or to any one of them separately is impossible and moreover it is perhaps harmful.

The organization and support of communications is a completely independent branch of military affairs directly involving the use of numerous communications troops and various technical means. Therefore, it appears to us that one of the most important organs in a front's system of field control should be the communications directorate.

Without dwelling on the organization of the communications system of a front, let us examine the problems which, in our opinion, are of fundamental significance in determining the organizational structure of the field control of a front, and which were not touched upon in General Ivanov's article.

First of all, it is advisable to dwell on the designation of the organs that are in charge of the organization of communications. Taking into account the future development of technical means of control, it is advisable to have in the field control a mechanism (apparat) for the chief of communications troops and an automated system of control for the front. All the forces and means of communications, the automation of troop control processes and provision for secret communications,

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

including cryptographic organs and means for making electrical signal communications channels secure should be concentrated in the hands of the chief of communications troops and automated control systems.

The chief of communications troops and automated control systems must organize a single system of communications for ensuring the control of the front's troops as a whole. All means, available at the present time to the chiefs of missile troops and artillery and to the PVO troops, and designated for the organization of an autonomous communications system, must be employed for the creation of a single system of communications for a front. It is also necessary to avoid using the independent high frequency (vysokaya chastota -- VCh) government communications units. The VCh government communications organs must have only station secrecy devices, operating on selected channels assigned from the overall front system of communications.

The above listed measures permit, in our opinion, a higher quality and more economical communications system for operational formations especially if one considers the development of multi-channel radio relay, radio, and wire communications systems and also the introduction of means of automating processes of control and means of communications.

At the present time, a sharp increase is evident in the requirement for communications channels for ensuring troop control and direction of the operational rear area. It appears to us that the basic direction in the development of means of communications, which permits most effectively provision for the increasing requirements is the creation of a single centralized system of communications with wide-scale use of multi-channel radio relay and wire means.

The effectiveness of this approach can be demonstrated by the following examples. The existing equipment for the multiple use of heavy field cable lines will permit receipt on one line of 4 or 5 telephone and one telegraph

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

channel. Prospective means offer the possibility of having 12 telephone channels on such a line and the adoption of prospective voice-frequency telegraph equipment will enable us to replace each telephone channel with 12 telegraph channels. As a result, by the adoption of multi-channel equipment, the effectiveness of the communications system on telephone channels can be increased by 3 or 4 times, and on telegraph channels by several dozen times. A similar result will be achieved by the adoption of multi-channel radio relay and radio means.

Consequently, the widespread introduction of multi-channel communications systems permit provision for the increasing requirements for communications channels in operational control elements without an increase in the number of communications troops.

And now the last of the questions touched upon by Major-General M. Ivanov in his article. We fully subscribe to his proposal concerning control points. Actually, the existence of forward command posts along with command posts does not promote the assurance of stable control under present conditions, on the contrary, it leads to a dissipation of forces and means, weakens the capabilities of the main command post, decreases its role in the control of troops and gives rise to complications in the organization of the communications support of a front. The creation of two independent control points, one of which is a reserve point, can in many respects further ensure the stability of troop control under the conditions of a nuclear/missile war.

Lieutenant-General of Communications Troops P. Kurochkin

The Fundamental Scheme of a Front Offensive Operation

by

Lieutenant-General V. Baskakov

The concept of the "fundamental scheme of an operation" is not familiar to our readers, so we shall define at once what we mean by it.

All operations of one war are waged by almost one and the same means of armed combat, and most often the organizational forms of troops in all operations likewise remain unchanged. Thus, within the extreme diversity of the specific features of the front offensive operations of the Second World War, one can discern specific traits characteristic of almost all of them. This was also noted in the operations of the First World War.

The substance of these general traits characteristic of all operations of a given war and taken in total we propose to call the fundamental scheme of an operation. By summarizing the basic characteristics of operations into a single scheme, it is easy to understand not only the substance and meaning of each of these characteristics, but also the mutual relationship and meaning of them in the operation as a whole. Such an examination of the basic characteristics of an operation of the last war is very convenient and makes it easier to establish graphically their suitability or unsuitability under modern conditions and to determine the fundamental scheme of an operation in a future war.

The fundamental scheme, put forth by us, of an offensive operation of a front in the period of the Second World War (diagram 1) is not a copy of any operation that took place. Nonetheless, among the great number of operations, there is none whose basic and fundamental characteristics would not be reflected on the given diagram.

[redacted] 1.3(a)(4)

[redacted]

[redacted] 1.3(a)(4)

[redacted]

[redacted] 1.3(a)(4)

We shall make clear why the fundamental scheme of a front offensive operation in the last war was the way it was.

The basic features of an operation are determined first of all by what type of armed forces, what arm of troops is the main one and what constitutes the basis of their combat strength. As is known, in the last war the chief means for conducting military operations and the basic combat strength of the armed forces were ground troops, consisting of combined arms armies (which in turn consisted of rifle divisions) and partly of large units of armored troops (tank and mechanized corps organized by brigades).

Besides this, the level of development of industrial production, science, and of technology in many countries was, by the beginning of the Second World War, already high enough to guarantee production of a variety of military equipment and arms. This also permitted the belligerents to bring their operational art out from the stagnant position in which it found itself at the end of the First World War. At the same time, it was still impossible to bring about complete motorization of all ground troops, as a result of which the basic combat complement of armies and fronts remained the rifle divisions. The quantitative growth and the qualitative development of artillery, aviation, and other means of neutralization, the raising of their destructive capabilities, striking power and range of operation still could not essentially alter their roles as combat and operations support weapons.

The aviation, artillery, chemical, engineer, airborne and other arms of troops with all of their combat equipment only assisted in accomplishing major combat and operational tasks, but independently they could not completely accomplish them.

By virtue of this, the outcome of combat and of an operation depended mainly on the success of the operations of the infantry divisions, which constituted not only the basis but also the absolute majority of the forces of ground troops. The destruction of the most important groupings of the enemy's ground troops was

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted]

[redacted] 1.3(a)(4)

the main purpose , the basic content of operations and of combat operations in general. In this, all attention was concentrated on routing the enemy in the tactical and immediate operational depth, where the significant part of his infantry divisions was located.

This was reflected in essence in the whole character of the last war and in the methods and forms of conducting combat operations, including the fundamental scheme for mounting an offensive operation of a front.

The depth of a front operation was determined by the disposition of the ground troops, the means for reinforcement, the control points, the rear installations and the basic forces of the tactical aviation of the group of enemy armies, and was 200 to 300 kilometers.

An offensive began, as a rule, with a breakthrough of the solid front of the enemy's combat formations on the most important axes and swiftly developed to the immediate operational depth, frequently leading to the encirclement of enemy troops. Such a method of conducting an operation was the only one possible, because the weapons of neutralization in that period, with all allowance for their concentration, could not by themselves destroy the enemy's divisions of ground troops and the means for their reinforcement. Our analogous divisions could rout, destroy, or capture the personnel of the enemy divisions only when they had the necessary superiority in forces and with advantageous operational preconditions.

Under these conditions, an important role in taking the decision for planning a front operation was played by the choice of the axes for the main and auxiliary strikes, the concentration on those axes of the necessary forces, and the establishment over the enemy of a superiority which guaranteed the success of combat operations. The theory of the main strike was fundamental in the operational art of the period of the Second World War. Therefore, the main strike also occupies the most important place on Diagram 1, which we cited.

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(1)

[redacted]

[redacted] 1.3(e)(4)

The exploitation of a breakthrough was accomplished by committing tank and mechanized troops into the battle, which assured high speeds for the offensive. The study of the operational exploitation of a breakthrough utilizing a mobile arm of troops, of the deployment of this arm of troops, and of the bases of the organization and preparation of its large units was also the most important in the operational art and in the military science of that period as a whole.

In the fundamental scheme of a front offensive operation of the last war there was shown the use of large units of armored troops for purposes of operational exploitation of a breakthrough and completion of the encirclement of the basic grouping of the enemy's troops.

Obviously, there is no need to prove that the fundamental scheme of a front offensive operation of the last war can no longer express the content of an operation in a modern nuclear/missile war.

Consequently, the problem consists of discovering in what measure the new fundamental scheme of an operation in a modern war differs from the former scheme, which elements from the old scheme retain their significance, which will disappear completely, and which will be transformed under the new conditions.

The degree of these differences is determined by the changes which occurred in the postwar period and which can occur in the future, primarily in the development of the productive forces and the political conditions of life in a society. The significant development of the productive forces of a society and of the weapons of armed combat cannot fail to cause a substantial change in the forms and methods of conducting combat operations in modern warfare and, certainly, introduces specific corrections into the fundamental scheme of a front operation.

[redacted] 1.3(e)(4)

[redacted]

1.3(e)(4)

[redacted]

[redacted]

1.3(a)(4)

The basic means of armed combat and of the basic combat strength of the belligerents, as we have already examined earlier,[1] will not be divisions of ground troops and not ground troops as a whole, no matter how they might be supplied with the weapons necessary for conducting a mobile war, but nuclear/missile weapons and the troops which assure their use, the destruction of which is the main goal of the military operations of the belligerents.

In connection with this, the number of divisions in the complement of a front will decrease significantly, and additional large units and units which ensure the use of nuclear/missile weapons will be included. However, this does not mean a belittling or negation of the important role of ground troops in routing of the enemy. The role of ground and airborne troops will be determined by the need to complete the rout of an enemy who has been subjected to nuclear strikes, to take and consolidate an area, to establish the forward edge of contact with the enemy's troops, and to protect and defend the operational rear area.

The content of the fundamental scheme of a front offensive operation in modern warfare must also specify all of this.

Considering the nature of nuclear/missile warfare, one can raise the question: will a front offensive operation take place at all? Will the war not end with the conduct of the initial massive nuclear/missile strike in conjunction with the utilization of chemical and bacteriological weapons? Indeed, at the moment there exist bases for raising such questions. It is enough to cite, for example, the possibility of the complete annihilation of whole countries by nuclear weapons in short periods of time. Despite this, however, we consider that the operation as a specific form

---

1 Special Collection of Articles of the Journal "Military Thought", First Issue, 1960.

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted]

[redacted]

1.3(a)(4)

of armed combat is also retained in modern warfare. It is impossible to reduce a future war only to an initial strategic nuclear strike. Such a strike, unquestionably, is a definite part, a stage, of such an operation. After these strikes an attempt must be made to conduct simultaneously and successively a series of operations in various theaters of military operations and operational axes. The basic content of these operations will be the conduct of powerful nuclear/missile strikes and vigorous actions by ground and airborne troops, the Air Force, and the Navy.

The main purpose of a modern operation, as is known, is the destruction of the enemy's nuclear/missile weapons. The front, which operates in specific demarcated lines and under the conditions existing in one theater, cannot carry on combat against, for example, intercontinental missile bases located on different continents because it does not have the necessary intelligence organs and weapons of destruction. It is clear that it is necessary to call on the weapons of the General Headquarters of the Supreme High Command for combat against them.

In connection with this, the place of the front operation in modern warfare will be determined, in our view, by which enemy nuclear weapons the front must destroy, under the given conditions. It is known that the nuclear/missile weapons of the USA are distributed in groups: the weapons of operational-tactical designation for ground troops, with limited tactical-technical potentialities, the majority of which are located close to the line of contact of the troops, and a part not farther than 100 to 150 kilometers; medium range missiles (2,000 to 3,000 kilometers), which are distributed at a depth of 500 to 1,500 to 2,000 km from the line of contact of the belligerents; and finally intercontinental missiles with a range of 8,000 to 10,000 kilometers or more.

The front's composition will be changed, depending on which group (groups) of nuclear/missile weapons it must destroy. Thus, if the mission of a front is to destroy and annihilate the operational-tactical nuclear/missile weapons and the first echelon of ground

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted]

[redacted] 1.3(a)(4)

troops, then its composition can be close to that currently accepted and the depth of such an operation will not change substantially in comparison with the experience of the last war. In this case, the destruction of the operational and strategic nuclear/missile weapons and the following echelons of ground troops, located beyond the limits of the depth of the front operation, must be accomplished with weapons of the General Headquarters of the Supreme High Command or it will be necessary to organize either a group of fronts or a command and staff for the theater of military operations with the appropriate combat weapons to perform these missions.

In our view, the most acceptable version of the mission of a front is the liquidation of all nuclear/missile weapons designated by the enemy for combat on a given axis and distributed within the boundaries of a given continent. In this case, the meaning of a front as the basic level of command in the organization of armed combat is preserved and removes the necessity of establishing intervening levels (a group of fronts or a command for the theater of military operations is eliminated). The General Headquarters is thus freed from carrying out the missions which the front formations are able to perform. Besides this, destruction of the enemy's nuclear/missile weapons requires the immediate deployment of the operations of ground and airborne landing troops throughout the depth of the given axis. This will be more difficult for the General Headquarters of the Supreme High Command to carry out than for the front, which has these troops at its disposal and is able to organize their coordinated operations. In this case, the nuclear/missile weapons located outside the boundaries of the offensive zone and of the missions of the fronts and chiefly on other continents and on the ocean will be destroyed by weapons of the General Headquarters of the Supreme High Command.

In connection with this, the depth of a front operation must be sharply increased, and this will be its new identifying characteristic. It should be noted that the calculated depth of a front operation since the last war has grown repeatedly. In the postwar

1.3(a)(4)

[redacted]

[redacted] 1.3(a)(4)

[redacted]

[redacted] 1.3(a)(4)

years it was 300 to 400 kilometers, with the appearance of nuclear/missile weapons it was 500 to 600 kilometers, and at the present time it reaches 1,000 kilometers and more.

It seems to us that the depth of a front operation, as well as the width of its offensive zone, must be defined on the basis of the role of the front in routing the enemy. Taking the above statements into account, we consider that the depth of a modern front operation must reach 2,000 to 3,000 kilometers. All enemy nuclear/missile weapons designated for combat in a given axis will be distributed within the boundaries of this area. The width of the front zone will also grow to 500 to 700 kilometers and more.

Thus, the front operation of the future must become an actual deep operation which meets the modern requirements for the simultaneous destruction of the enemy's nuclear/missile weapons throughout the depth of a given theater of military operations.

In the operations of past wars, simultaneous fire effect against the entire depth of the enemy's defense could not be realized because of the lack of sufficiently powerful and long-range weapons of neutralization (with the exception, of course, of aviation) and in practice did not exert a decisive influence on the outcome of an operation. Nuclear/missile weapons permit accomplishment of the simultaneous neutralization of the enemy at a depth of hundreds and even thousands of kilometers, and the full motorization and mechanization of the armies and the mass use of airborne troops ensures the swift transfer of operations to the operational depth where the enemy's basic weapons of nuclear attack will be located. In connection with this, modern front operations will be distinguished mainly by the delivery of massive nuclear/missile strikes on the enemy's nuclear weapons and other important objectives and by the quick exploitation of the results of these strikes by ground and airborne landing troops.

An essential modification will occur, in particular, in the operations of the ground troops. Full motorization and mechanization

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4

[redacted]

[redacted] 1.3(a)(4)

of ground troops, it would seem, facilitates swift operations for the purpose of the most rapid penetration into the enemy's operational depth, of exploiting the results of the nuclear/missile strikes delivered against him, and of completing his rout. However, the possible speed of advance of large units of ground troops and the rate of the offensive (100 kilometers and more per 24-hour period) still will not guarantee the immediate gaining of nuclear and other targets of operational significance or their destruction.

Even the maximum speeds of a modern operation allow an enemy to reorganize to a certain degree, to transfer the surviving nuclear weapons to other regions, to bring up new forces from the zone of interior, and to organize resistance to the attacking troops. Therefore, we must look for something else, namely, for the operations of troops with significantly greater speed than that which ground troops have.

During the Civil War and the Second World War the assignment and skillful use of the mobile arm of troops as an independent operational category yielded great advantage, and there are no grounds to consider that in modern warfare this principle will not be accepted.

The conduct of deep operations and the transfer of vigorous operations to a significant operational depth of the enemy's formation in short periods of time will be more essential now than in past wars. Therefore, the significance of the mobile arm of troops not only does not decrease, but even increases.

The mobility of troops must be such that they can get to regions where the enemy's nuclear/missile weapons are located literally just a few hours after the delivery of our nuclear strikes and before the enemy succeeds in re-establishing his own combat effectiveness and in eliminating consequences of these strikes.

This can be achieved only by airborne landing troops, as well as motorized rifle units and large units, transferred to the

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(

[redacted]

[redacted] 1.3(a)(4)

enemy's operational depth by air transport. However, one must speak not of the dropping or landing of separate operational airborne landing forces into the enemy's deep rear area, but of the massive use in the operation of airborne and motorized rifle troops as a mobile arm of the troops.

Reviewing the fundamental scheme of an operation in modern warfare (Diagram 2), I should like to draw the reader's attention to the question of the principle of the main strike and its role in a modern operation. We examined this problem in detail in an article published in the first issue of the Special Collection in 1960. Under modern conditions, to attach the operations of the basic forces of the front and primarily of nuclear/missile weapons to a specific axis, even a very important one for the operations of ground troops in the front zone, is completely incorrect. The concentration of forces and weapons on a specific axis in an operation can no longer be a definite operational principle and must be replaced by the principle of concentration of the basic efforts of a front on the destruction of the enemy's nuclear/missile weapons and the basic groupings of his ground troops. In this, the ground troops of a front will function not as large groupings and not on a solid front, but on several axes as separate large units and even as units, while carrying out a broad maneuver during the operation.

As an example, I should like to note the decision taken by the commander of the southern side in an operational exercise in 1960. One of the most important characteristics of this decision, in our view, is that in it several new means of conducting an operation under conditions of the mass use of nuclear/missile weapons were shown. The need to create cumbersome groupings of ground troops which are a good target for the enemy's nuclear attacks is precluded by the solution in the operation.

Such will be, in our opinion, the basic characteristics of an offensive operation of a front in a future war which also must determine the outlines of the fundamental scheme of this operation.

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted]

[redacted]

1.3(a)(4)

The diagram presented reflects these characteristics and can be looked upon as typical for a front offensive operation.

This diagram shows that the primary weapon for routing the enemy in an operation is nuclear/missile weapons and not ground troops and that divisions of ground troops and airborne troops are used only for purposes of completing the enemy's destruction.

The operation begins with a powerful nuclear strike on the nuclear/missile weapons and the basic groupings of ground and airborne troops, the aviation and the navy of the enemy. Simultaneously with this strike or immediately thereafter the troops of the first operational echelon shift to the offensive, and an airborne landing operation is carried out. Graphically the destruction of nuclear weapons and the defeat of the enemy's troops by the nuclear weapons of a front are indicated on the diagram by areas of complete neutralization and by zones with high levels of radiation.

The basic groups of missile troops and the fundamental apportionment of missions among them are reflected on the diagram. The use of medium range missiles with a firing range of up to 1,000 to 1,500 kilometers, which are designated for the destruction of the troops of a group of the enemy's armies and nuclear/missile weapons within the limits of this range, must be closely coordinated with the operations of the first operational echelon of the ground troops and airborne troops which have been thrown into the immediate operational depth. The use of long range missiles with a firing range of 4,000 to 5,000 kilometers must be coordinated with the execution of basic airborne landing operations in the operational depth of disposition of the enemy's troops. It is possible that the number of classes and groups of nuclear/missile weapons can also be different if this depends on considerations of an economic or technical nature. From an operational viewpoint, however, it is sufficient to have missiles of the indicated classes as the weapons of a front.

[redacted] 1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted]

[redacted]

1.3(a)(4)

The most important principle of a deep operation is expressed on the diagram as the simultaneous neutralization by nuclear weapons of all of the most important targets and primarily of the enemy's weapons of mass destruction, his ground and airborne troops, and his aviation in the entire depth of their possible disposition to the borders of the continent, in conjunction with the offensive of the first echelon of ground troops and with the operations of powerful airborne forces in the deep operational rear area of the enemy.

The ground troops have been represented as two echelons. The first operational echelon consists of two armies consisting in all of 12 to 15 divisions and designated for completion of the rout of the troops of the enemy's group of armies. The second operational echelon consists of one army with 7 or 8 divisions, whose mission is not to develop success in the operation, as was done formerly, but defense of the operational rear area of the front and combat with the operational airborne landing forces of the enemy during the whole operation. The large units of the second echelon of the front can be utilized in case of the need to augment the efforts of the attacking armies of the first echelon and also as operational landing forces. The divisions which have been operating in the first echelon and have lost their combat effectiveness are removed from combat and are used to fill out the complement of the second echelon.

The airborne landing troops are represented on the diagram as an airborne army consisting of three or four airborne divisions assigned to seize a landing area for the operational landing forces of the front, and also for coordinated operations with the first operational echelon of the ground troops.

On the whole, according to the diagram of an operation, the composition of a front consists of four army commands in all uniting 25 to 30 motorized rifle, tank, and airborne divisions. As is known, during the last war approximately 30 to 35 and more divisions were included in the composition of a front. Considering that now the front's zone will be increased by two

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted]

[redacted]

1.3(a)(4)

or three times, the number of divisions of ground troops and airborne troops in a modern operation will be reduced approximately by three times.

As rough operational calculations show, a front needs approximately 250 to 300 nuclear (including about 50 hydrogen) warheads with an overall yield of 120,000 to 150,000 kilotons to accomplish its missions. Up to 100 missile launching mounts and about 30 to 40 delivery aircraft are needed by the front in order to utilize these warheads. With effective use of this quantity of nuclear/missile weapons, about 25 to 30 missile bases and depots of nuclear warheads, 30 to 40 airfields, 25 to 30 divisions of ground troops, 15 to 20 naval bases, and other objectives can be destroyed.

The forces and weapons of the front will be echeloned to a depth of 2,000 to 3,000 kilometers. A depth of distribution of the forces of a front of 200 to 300 kilometers, as was the case in the last war, does not answer the new conditions.

A front control echelon of the existing organization will no longer be able to direct a front operation conducted according to the proposed scheme. The modern field control echelon of a front, besides a headquarters, must have commanders and staffs of the missile, ground, and airborne troops, antiaircraft defense, and aviation. This will correspond to the composition of the front and the particular features of troop operations in the operation.

A front operation, obviously, must be planned by stages. The first stage, for example, might include the neutralization and destruction of the enemy's main forces and weapons. The main content of it must be the repelling of the initial nuclear strike of the enemy and the delivery of the first nuclear/missile strike by forces of the front. The second stage can consist of completing the rout of the enemy's forces and weapons. Its content will be an offensive by ground troops, the execution of

1.3(a)(4)

[redacted]

[redacted]

1.3(a)(4)

[redacted]

[redacted]

1.3(a)(4)

landing operations, and the delivery of nuclear/missile strikes during the offensive.

In our opinion, this is the way the fundamental scheme of a front offensive operation in a future war must appear.

Support of the Strategic Concentration and Deployment of the Armed Forces in Respect to Transport

by

Major-General of Technical Troops Ya. Shchepennikov

Transportation support is one of the factors that exerts great influence on the strategic concentration and deployment of the armed forces. Nevertheless, in numerous works devoted to the theory of strategic concentration and deployment, the position and capabilities of transportation are not fully considered. While noting the direct dependence of the success of strategic concentration and deployment on the preparation and work of transportation and realizing the great probability of serious difficulties in carrying out shipments, many analysts do not, in their work, make even a cursory analysis of the conditions of transportation work during the period of threat; and at the beginning and during the course of a war, they do not arrive at any conclusions on the influence of these conditions on the organization of the strategic concentration and deployment of the armed forces in theaters of military operations and in internal areas of the country.

In this article, the dependence of deployment of the armed forces on the condition and work of transportation and also the basic requirements for preparing the transportation network for the purposes of carrying out shipments for strategic concentration are examined.

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

The existing contradictions in individual theoretical problems give rise to the necessity for a preliminary clarification of certain initial positions.

First of all, it should be noted that the term "strategic concentration and deployment of the armed forces" in the following text refers to the concentration and deployment not only of operational formations, troop large units, etc., themselves, but also of materiel (for example, munitions and fuel). In accordance with this, shipments of troops and the materiel necessary for their support are also included in the concept of "shipments for strategic concentration".

In speaking of strategic echelons, we mean that the first of these consist of the forces and weapons necessary for achieving the strategic aims of the initial period of a war; it is divided into several (not less than three) operational echelons. The first includes the troops and materiel that are in a full state of readiness for immediate operations, the second is the forces and weapons designated for increasing the efforts of the initial operations with readiness for proceeding to areas of concentration after several days, the third is the forces and weapons to be used only several weeks after the beginning of full mobilization, for the development of the subsequent operations of the initial period of a war.

In certain analyses,[1] three possibilities for the strategic concentration and deployment of the armed forces are considered. The first is most favorable, when it is executed in advance as the threat of war becomes more intense; the second, when concentration and deployment starts during the threatening period and terminates after the beginning of war; and the third and least favorable, when deployment takes place after the enemy has initiated military operations.

---

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

In this article, we shall consider transportation support of the strategic concentration and deployment of troops in the second situation, which is more convenient for analysis and is the most probable.

Many analysts distinguish the following periods in the course of the rise and development of military operations: the threatening (which may not even exist), the initial, and the subsequent. Certain authors emphasize the necessity for dividing the second of these into two parts: the actual beginning of a war and the subsequent phase of development of military operations during the initial period of a war.[1] This is motivated by the great difference in the composition of each of the phases of the initial period of a war. We share such a point of view and adhere to it in the following discourse.

To determine even approximately the conditions of the strategic concentration and deployment of the armed forces after the completion of initial operations is extremely difficult. Therefore, the following analysis of the problems of supporting strategic concentration and deployment in respect to transport is limited to the period of threat and the beginning of a nuclear/missile war.

* * *

In numerous analyses, the authors, while not rejecting the possibility of a sudden initiation of war, consider it no less probable that it will be preceded by a certain period of intensification of the immediate threat of war, a period of threat. It is necessary to use this period for increasing the readiness of the armed forces and the rear area of the country to repel the probable enemy attack and for creating conditions for the complete and final destruction of the enemy in a short period of time.

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

In regard to the armed forces, such measures include bringing the forces and weapons of the first operational echelon (first of all--missile troops, armored and PVO troops) up to full combat readiness and making appropriate changes in their operational formation. At the same time, bringing the troops up to full strength, their provision with materiel, the movement of the second operational echelon to areas of concentration and deployment, and the delivery of various supplies to these areas are carried out. Full mobilization and the formation of new troop large units, units, and rear establishments to be included in the composition of the third operational echelon will commence.

At the same time, during the period of threat a transfer of the national economy to satisfy the requirements of an approaching war is accomplished, including partial mobilization of industry and transportation, increasing materiel reserves for the most important industrial enterprises, protection of the population, etc.

All of the enumerated measures are accomplished as secretly as possible, which narrows their scope. The period of time for carrying out these measures is directly dependent on the duration of the period of threat, which can presumably consist of several hours to several calendar days.

For an analysis of the capabilities of transport for supporting the strategic concentration and deployment of the armed forces, we are arbitrarily assuming an eight-day period of threat. During this time, it will be necessary to carry out a large volume of military (mobilization, for strategic concentration, operational, etc.) and national economic shipments.

The possible timing for commencing the shipment of any troop large unit (unit, establishment) depends on the readiness for this of both the troops and the transportation means. The estimated time for the completion of a shipment is determined by its volume, speed, distance, and the rate of movement on the given route.

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.5(a)(4)

[redacted] 1.3(a)(4)

Rail transport is best prepared for carrying out military shipments; 24 hours after the declaration of mobilization it is capable of carrying out very large military shipments while simultaneously continuing its former operations and coping with new national economic shipments. Military shipments of relatively small dimensions can start several hours after the declaration of mobilization.

It should be emphasized that the use of rail transport for shipping connected with the strategic concentration of troops depends primarily on two conditions: the observance of secrecy in these shipments and the magnitude of other shipments being carried out during the very same period. These conditions assume special significance in those instances when troops are shipped for strategic concentration to a foreign section of the theaters of military operations, on railroads with West European gauge. Along with the special difficulty of ensuring the secrecy of shipments, it is necessary to consider that they will be carried out simultaneously with national economic shipments between the Soviet Union and the other socialist countries. At the present time, the volume of the turnover of rail cars at transshipment areas at the junctions of railroads of Soviet and West European gauges is already so vast that it takes up from 30 to 60 percent of the total traffic capacity of the railway sectors in these areas (Brest, Chop-Mukachevo, Ungeny). In line with the development of industrial communications between the countries of the Socialist Camp, the volume of turnover is steadily increasing. It is not possible to cease these shipments during the period of threat, since this will impede the work of defense industry enterprises and, in addition, it will reveal preparations for war. Therefore, we feel that shipments for strategic concentration during the period of threat must be carried out at comparatively low rates, not exceeding approximately 30 to 35 percent of the traffic capacity of the railroad lines.

Since it requires considerably more time to prepare water transportation means (river and sea) for military shipping than railroads, it is advisable to ship by water transportation (when it is possible to use it) those troop large units and units that require several days to prepare for movement.

[redacted] 1.3(a)(

[redacted] 1.3(a)(

[redacted] 1.3(a)(4)

The timing for beginning troop march movements on any vehicular road is dependent on the speed in deploying refueling points on it and the creation of sufficient fuel reserves. In order to support the march movement of a motorized rifle division for 100 km, up to 450 tons of fuel are required, and for a tank division, up to 530 tons. The march movement of troops for long distances requires a well organized fuel supply system. The requirement for secrecy should be considered in determining the route speeds of movement of large units and units on vehicular roads. Observation of this requirement can often necessitate the execution of a march only during the hours of darkness.

Let us consider what is the permissible distance for shipments for strategic concentration executed during the period of threat.

The maximum permissible (calculated) distance of shipments carried out in the course of a definite period of time is determined on the basis of the calculated rate of speed along the given route, the expenditure of time for preparatory loading, unloading, and other work, and also for the march movement of the troops.

The permissible expenditure of time for the movement of an echelon from a loading point to an unloading point (Tdv)[1] is determined by the difference between the duration of the calculated (threatening) period and the expenditure of time for all other work, the march movement, etc., (Tup - ΣT).

The results of the determination of the maximum permissible distance for shipping a troop large unit (unit, establishment) under various conditions are listed in the table.

---

1. Headquarters Comment. Probable meaning of Tdv - Time of movement of troops. See table on page 9 for probable meanings of subsequent symbols.

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

The expenditure of time for the preparation of troops and shipping means, for a march movement to the loading point, and for the loading of the first echelon (Tpd) is established as within the limits of from 1 to 4 calendar days.

The expenditure of time for the dispatch of all echelons of a large unit or unit being transported from the loading area (To) is assumed to be from 2 to 4 calendar days.

The expenditure of time for the march movement from the moment of the completion of unloading of the last echelon of a large unit up to the completion of its deployment in the appropriate area (Tsr) is assumed to be within the limits of 1 to 2 calendar days.

The route speeds of movement (Vm) are assumed to be within the limits of from 200 to 500 km per calendar day. The higher limit is for favorable conditions of shipment by rail transport and the lower is for difficult conditions of shipment by river transport.

1. Headquarters Comment
   Probable meanings of symbols:
   Tpd - Length of time for loading operations
   To - Length of time for dispatch
   Tsr - Length of time for strategic deployment
   Tup - Length of time of period of threat
   Vm - Route speed of movement.

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

As can be seen from the table, the maximum permissible distance for a shipment does not exceed 2000 km. This distance can be achieved under conditions when the first echelon is dispatched from the loading area 24 hours after the start of the period of threat, the dispatch of all the echelons takes no more than two calendar days, and the time from the moment of completion of the unloading of the last echelon to the completion of deployment consists of no more than one calendar day with the route speed of movement of the echelons being transported being equal to 500 km per calendar day.

If, however, the total time expended for preparation, loading, dispatch of the echelons, unloading, and march movement consists of 5 to 7 calendar days, with the route speed averaging 350 to 400 km, then with a period of threat of 8 calendar days duration, the maximum permissible distance will be 400 to 1000 km. And since a decrease in the duration of the period of threat is more probable than an increase, it is advisable to consider the permissible distance for shipments to be 400 to 700 km.

Another computation will result in a similar conclusion. As is known, it is envisaged that the build-up of the efforts of the troops of a front during the first offensive operation will be achieved by means of maneuver by the nuclear/missile weapons and the commitment to the operation of the troops arriving from the zone near the front and the internal areas of the country. Let us consider the maximum distance from the border (front line) at which the operational formations and troop large units designated for increasing the efforts of the front during the progress of the operation can be located.

To explain this problem, we shall refer to the example shown on the diagram. The diagram is a graph of the movement of troops on which are indicated the possible time periods for "overtaking" ("nagon") the advancing troops of the front by the troop large units being transported.

[redacted] 1.3(a)(4)

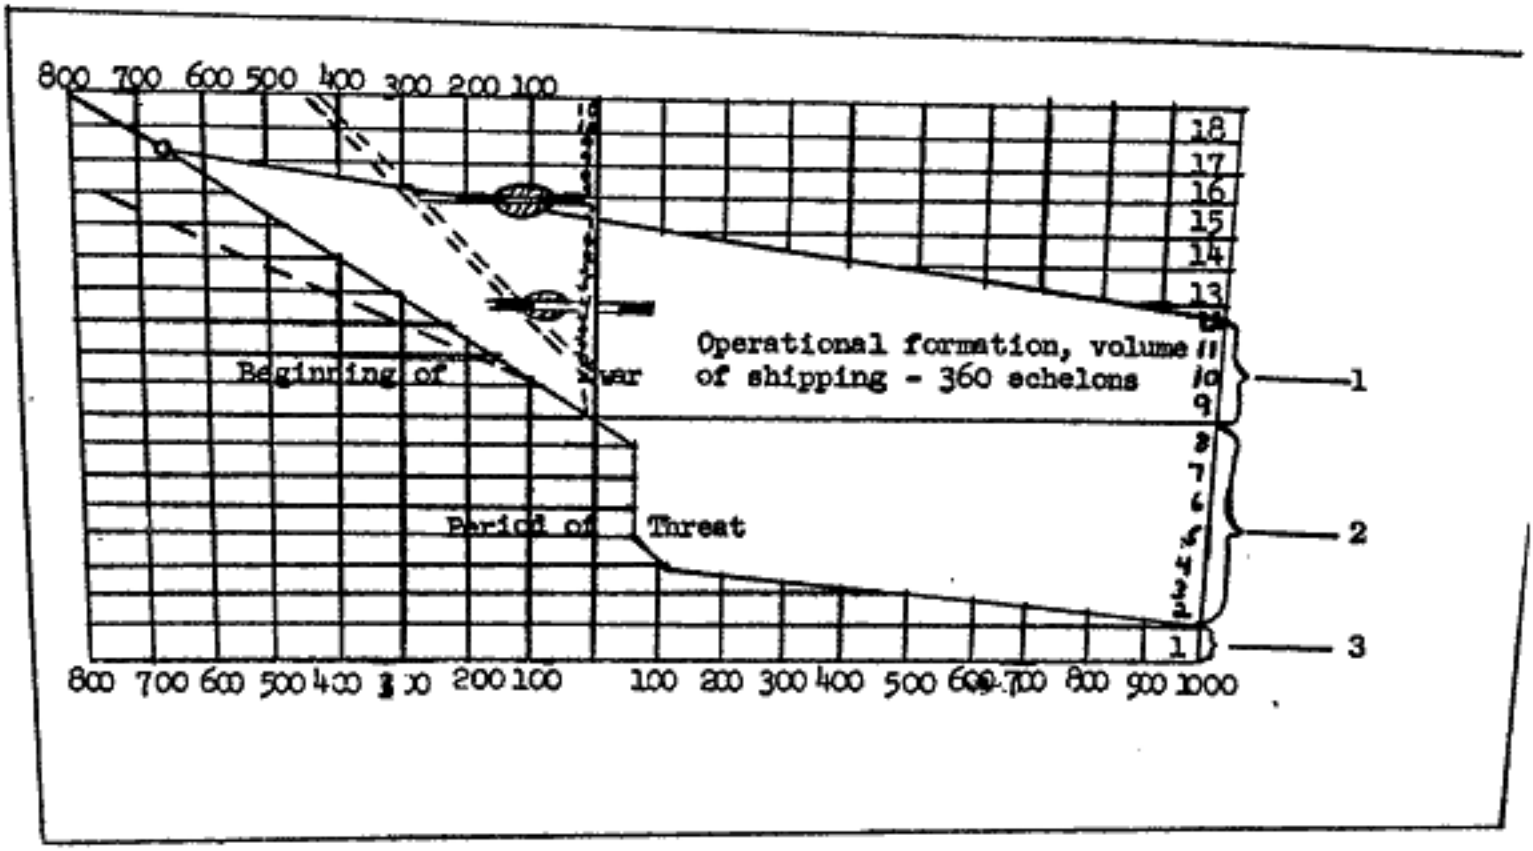
[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

The distance of the disposition areas of the troops of an operational formation (combined arms army) designated for increasing the efforts of a front in an operation is approximately 1000 km. The first offensive operation must be carried out to a depth of about 800 km at a rate of 80 to 100 km per calendar day. The duration of the period of threat (calculated) is 8 calendar days. The duration of the operation is 10 calendar days.

The volume of shipment of an operational formation on available railways (West European gauge) consists of 360 troop trains (eshelon). The first troop trains can be dispatched on each of the railroad lines one calendar day after the start of the period of threat. The possible rate of shipment of an army during the period of threat is 30 trains (echelons) per calendar day, and at the beginning of the operation 60 troop trains. The possible route speed of movement of the troop trains during the period of threat is 500 km per calendar day, and 300 km per calendar day at the beginning of an operation, in view of disruptions of the work of the railroads. With this average route speed, troop large units can execute march movements following the advancing troops of a front. Reconstruction of railroads is carried out at a rate of 50 km per calendar day along each of the lines being reconstructed to the extent that the troops of the front move forward in an operation. Echelons of tanks and so far as possible other large units are dispatched to the forward unloading areas as they arrive. The march movements of troops are supported with everything necessary.



Thus, we create sufficiently favorable conditions for the execution of rail shipments and march movements of troops during the period of threat and during the course of the first operation. But even in this (see graph, diagram 2) during the period of threat, before the beginning of the operation, no more than 150 echelons will be able to reach the unloading areas, and the remaining echelons will arrive during the course of the operation and after unloading will proceed to "overtake" the advancing front troops by executing a march movement over long distances. The last echelons of the incoming large units will be able to "overtake" the advancing troops only on the ninth day of the operation.

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

Graphic plan for shipment of a combined arms army in the threatening period and after the beginning of war

Conventional Signs

- Line of reconstruction of railways
- Lines of movement of rifle and tank troops
- Unloading areas on reconstructed sectors of railways

Key

1. Rate of shipments: 60 echelons per calendar day, speed 300 km per calendar day.
2. Dispatch by rail: rate 30 echelons per calendar day, speed 500 km per calendar day.
3. The preparation of troops and transport means for shipment.

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

Thus, even under favorable conditions, it will be possible to use only part of the troops that make up the complement of the combined arms army for increasing the efforts of a front in the first operation. The other part, consisting of no less than 50 percent of the troops, as may be seen from the graph, cannot be used for this in view of the great expenditure of time for their transfer from areas of initial disposition.

One should not count on the possibility of decreasing the expenditure of time by means of a still greater increase of the rates and route speeds for shipments and march movements of troops since there are no sufficient bases for this. Consequently, it is possible to decrease the time for movement and shipment only by means of bringing the initial disposition areas of the troops closer to the border (front line).

In order to commit the troops of a combined arms army to an operation on the third or fourth day, it is necessary to execute parallel troop march movements along with and at the same rate as rail shipments during the period of threat, and to have the troop disposition areas at a distance of 600 km from the border.

The calculated distance for the delivery of technical equipment by rail, motor vehicle, and water transport during a period of threat of 6 to 8 calendar days' duration is determined within approximately these same limits of 400 to 700 km.

Consequently, if prior to the beginning of war we will have a period of threat of the duration assumed by us, then during the course of this period the shipment of troops for strategic concentration can be carried out only on a small scale and at comparatively slow rates; the permissible distance for rail shipments of troops whose concentration and deployment must be completed prior to the expiration of this period will consist of 700 to 500 km (and less). The distance of troop march movements is limited by approximately the same restrictions. It makes sense to include in the number of large units and units being transported only those whose readiness will enable them to begin to move not later than during the first two or three days of the period of threat.

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

All of the remaining shipments initiated during the period of threat will be in progress at the moment of the start of military operations. It will be necessary to complete them during the course of the war, under completely different conditions. We shall turn to an analysis of these conditions later.

In certain theoretical works it is proposed to consider the beginning of a war as a special phase of its initial period, after which (in case of lengthy combat) follows another phase which is characterized by a different content. This position is sufficiently valid.

The beginning of a war is distinguished by the highest possible intensity of operations. Each of the sides will be striving to achieve victory in the shortest period of time and will exert the greatest efforts for this. Mutually inflicted strikes will be of maximum power, and their results will be unprecedented devastation. But for this very reason, the period of the actual beginning of combat cannot be lengthy. After several days of a nuclear/missile war, both sides will sustain such great personnel and materiel losses that to continue combat at its previous intensity will be impossible. The resources of even the powers that are strongest economically and which possess a large territory will to some extent be exhausted. It will become intolerable to expend forces and weapons on the previous scale; on the contrary, in continuing combat, it will be necessary to accumulate them as rapidly as possible for delivering powerful new strikes against the enemy. This is the way the next phase of the initial period of a war will ensue: stubborn, fierce, but lengthy combat under sharply changed conditions of the situation.

In the beginning of a war, during its first hours and days, very major changes will occur in the strategic, economic, and political situation in the theaters of military operations and in the rear areas of the coalitions that are taking part in the combat. Can one assume that they will not reflect on the previously prepared plan for the strategic concentration and deployment of the armed forces? Obviously, such an assumption is not correct. Is it advisable to amend this plan during the first days of a war? In our opinion it is also necessary to give a negative reply to this question.

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

The situation at the beginning of a war will be changing so sharply, substantially, and rapidly that it will be extremely difficult immediately to take into account the changes that are occurring, to evaluate them correctly, and to adopt a decision to change the strategic concentration and deployment of the armed forces. In addition, it is doubtful that this is necessary since during the course of the next days the situation can again change sharply.

Consequently, changes in the plan for strategic concentration and deployment will be unavoidable, but to adopt a final decision on these changes and to proceed to put them into effect will be advisable only after the termination of the actual starting phase of the war and the advent of the next phase of its initial period which will have different characteristics.

If one agrees with this conclusion, still another question arises: should troop movements be continued in the first days of a war according to the previous plan or is it advisable to suspend these until necessary modifications have been incorporated in the plan? We feel that a general suspension of the strategic concentration and deployment of the armed forces is unlikely at the beginning of a war. Such a measure is completely possible, however, on certain axes, or in certain areas, under especially complex conditions.

The success of strategic concentration and deployment of the armed forces under any conditions depends, to a large degree, on the condition and capabilities of transportation; but this dependence is especially intensified at the beginning of a war.

The beginning of a war immediately exerts the strongest influence on the condition and use of the transportation network in theaters of military operations and in the internal areas of the country.

Nuclear/missile strikes on major administrative, industrial, and power centers and on strategically important areas will bring about destruction of transportation centers and the annihilation of transportation installations and structures, shipping means, and reserves of fuel and materiel.

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

Individual, most important elements of the rail network (developed centers, transshipment areas at junctions of railroads of Soviet and West European gauges, large seaports, sectors of locks on river ways, and major man-made structures outside cities) may, in some cases, also be independent objectives for strikes. The enemy will also execute attacks on relatively small objectives on the territories of the fronts: stations and wharves, highways, airfields, etc., Through traffic on rail lines, main highways, and canals will be interrupted at many points, often for a long time. A number of sectors of the transportation network will be contaminated. Frequent and sharp changes in the condition on the network, disruption of communications and coordination between transport and other organs of control will strongly complicate the control of shipping. Thus, from the very first hours of war, the working conditions of the network will become very complex and difficult.

But, simultaneously with the rise of difficulties in the working of the transportation network and the significant curtailment of its shipping capability, demands for shipments will also be curtailed with the beginning of a war.

In the first days of a war, when entire areas in the theaters of military operations and in the rear of the country will be subjected to massed nuclear strikes, mass economic, local, and intercity passenger travel will be significantly curtailed. It is highly probable that during these days it will be advisable to curtail the sizes of mass military shipments also, both of personnel and of goods, in order to avoid increased losses.

The volume of shipments executed in the first days of a war must be strictly limited. Major shipments at high speeds must not be planned. This leads to an accumulation of personnel, equipment, and goods at the approaches to destroyed centers, man-made structures, and in areas of the junctions of various types of transportation.

Along with a strict limitation of the volume of shipments, their distance should also be limited. We believe that

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

shipments by land and water transport in the first days of a war can best be carried out at distances of 600 to 800 km.

In organizing shipments, it is unthinkable to count on filling to a high degree the traffic and hauling capacity of the routes of communication. In order to ensure the flow of shipping and also to accomplish urgent unanticipated shipments, it is absolutely necessary to have reserves of transportation means.

Thus, it may be concluded that in the period of threat, as well as in the first days of a war, shipments for the strategic concentration and deployment of the armed forces can be accomplished in relatively small volumes, at low speeds, and at distances not exceeding 600 to a maximum of 800 km.

Obviously, all this will exert an influence on the organization of the strategic concentration and deployment of the armed forces which, in our opinion, comes to the following.

1. In the period of threat, and even more in the first days of a war, it will be possible to accomplish shipments for strategic concentration and march movements of troops only at a small fraction of their overall volume and for relatively short distances.

2. In peacetime, the actual capabilities for accomplishing shipments and march movements of troops must be taken into account in determining the disposition of forces and weapons in the probable theaters of military operations.

3. Transportation capabilities must be strictly considered in determining permissible distances between the operational echelons of the strategic formation of the armed forces, between the areas of disposition, loading, unloading, concentration and deployment of troops and reserves of materiel in accordance with the plan for conducting initial operations.

1.3(a)(4)

[redacted]

[redacted]

1.3(a)(4)

[redacted] 1.3(a)(4)

1.3(a)(4) [redacted]

With the shift of military operations into the next phase of the initial period of a war, strategic concentration and deployment of the armed forces will continue, but then according to a plan which has been altered in one way or another to accord with the new conditions.

Success in the further conduct of a war will depend to a significant degree on the periods of time needed to ready our forces for active and decisive operations; tremendous influence on this will be exerted by the degree to which transportation has been prepared for work in wartime.

Advanced preparation of transportation for war, primarily for supporting strategic concentration and deployment, assumes especially great importance today. The preparation of transport should ensure the viability of the entire transportation network and the continuity of shipping; a shipping capability sufficient to accomplish previously planned military and economic shipments at the beginning of a war, with the retention of considerable reserves for the regulation of planned, and the execution of unplanned, shipments; a capability for the rapid movement of flows of shipments and of transportation reserves; the constant readiness of transportation for working under the conditions of a war which has begun.

The following are the basic measures directed at fulfilling these requirements: organization of the comprehensive use of all modern types of transportation for military purposes, an increase in the operational efficiency of the control of their joint work; prior development of the transportation network, ensuring this by special means for preserving the continuity of shipping and the rapid elimination of disruptions in traffic; protection of the network from contamination by radioactive and toxic substances.

The necessity for the comprehensive use of all types of transportation for carrying out shipments in wartime and the organization of their preparation and joint work according to a unified plan and under unified direction has now been generally recognized. However, in the proposed solutions to individual problems in this organization, considerable diversity of opinion is encountered.

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

Certain analysts, in appraising the possibilities for using various types of transportation in a nuclear/missile war, believe that rail transportation is poorly suited for work in wartime in view of the great probability of lengthy interruptions of through traffic at many points of the railway network, and that water transportation can be used only on certain axes. To this, they add that on sea and river channels and river sectors with locks, still longer interruptions of through traffic will arise than on railroads. From this, it is concluded that the basic shipping work in ground theaters of military operations and in the zone of interior must be accomplished by motor vehicle and air transportation.[1]

We consider such a conclusion to be incorrect. It is known that at the present time in our country, and in the overwhelming majority of the other countries of the Socialist Camp, rail transportation carries the greatest proportion of the overall freight turnover. It will play a leading role in the future also. According to the plan for the development of our transportation network in 1965, the specific proportion of rail transportation in the overall freight turnover will be 71.3 percent; sea, 10.5 percent; river, 5.1 percent; motor vehicle, 6.2 percent; pipeline, 6.8 percent; and air, 0.07 percent. Consequently, to shift the largest part of the shipping work to vehicular and air transportation in wartime will be simply impossible in view of their insufficient capacity for this.

In addition, on main vehicular highways and other important vehicular roads, the destruction of transportation centers, major bridges, etc., will also cause interruptions of through traffic. It will be necessary to conduct traffic along by-passes, to establish temporary passages and river crossings to overcome contaminated sectors of routes. All this will decrease the traffic-carrying capacity of vehicular roads and will increase the expenditure of vehicular transportation in carrying out shipping work.

---

1. "Modern War", General Staff Academy (Akademiya GSh), Moscow, 1960, p. 71.

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

The rise of lengthy interruptions of traffic at many points on the rail network does not at all mean that the undamaged sectors of the network remaining between these points cannot be used for shipping. On the contrary, it is completely possible to retain the working capacity of these sectors. The same also applies to sectors of interior water routes. Of course, destruction of centers, ports, major man-made structures, and the liquidation of part of the shipping means will lead to a significant lowering of the traffic and hauling capacity of railways and river routes. But, with proper preparation, they can carry out a considerable share of the shipping work in wartime, especially if it is considered that the required volume of shipping will decrease in comparison with prewar.

In wartime, the work of rail transportation in zones near the front both in theaters of military operations and in internal areas of the country must carry the greatest proportion. Because of this very condition, it is necessary to guarantee the comprehensive use of various types of transportation for military purposes.

A capability for their comprehensive use in wartime should be ensured beforehand both technically and organizationally.

The solution to this problem from the technical standpoint consists of mutual coordination in the development of various types of communications routes and their junctions, shipping means, means of transferring goods from one means of transportation to another and in the coordination of their joint work. Continuity of shipping is ensured by special measures in cases of destruction of transportation centers, power centers, major man-made structures, and other important objectives.

From the organizational standpoint, unified direction of the preparation and working of various types of transportation in wartime has the most important significance. As is known, in view of their specialization, not one transportation ministry or department and not one service of the armed forces can direct the comprehensive use of all types of transportation.

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

Therefore, it seems to us that unified direction of the preparation of the transportation network and the use of it on the territory of each front and each district located in zones near the front and in the internal areas of the country should be accomplished by special organs. Obviously, the structure and functions of these organs can be determined only by governmental decisions.

Various solutions to the problem of securing unity of direction in the preparation and employment of the various types of transportation for accomplishing shipping on the territory of the front are proposed.

In certain works the idea is advanced of using for this purpose a control organization very similar to the one used during World War II. In view of the increasing complexity of directing shipments under the conditions of a modern war, it is envisaged to improve this organization by including the transportation department in the rear area staff of a front.

It is considered, however, that this department should direct only the use of various types of transportation, not for all types of shipments but only for transporting materiel and for evacuation.[1] Thus, direction of the preparation of all types of transportation for joint work and also of the execution of all types of shipments according to a unified plan are not included in the functions of the 3rd Department. As a result, neither unity in the preparation of the transportation network of a front as a whole nor unity in its working is ensured. The transportation services of a front will receive instructions on these problems from various control echelons. Obviously, such organization of direction cannot secure the comprehensive use of all the types of transportation of a front.

---

1. "The Rear Area in Modern Operations," Rear Services Staff of Moscow District, Moscow, 1959, p. 293.

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

Other authors consider that the 3rd Department of the rear area staff of a front is, by its very position, unable to resolve the practical problems of planning and coordinating the work of all the types of transportation of a front. Instead of this department, they propose the creation in a front of a unified transportation service (directorate) provided with the necessary authority for organizing the centralized use of all the types of transportation subordinate to the front and with appropriate powers for coordinating problems of military shipping with the necessary ministries and departments. To secure direction of military shipping, it is proposed to work out schedules and plans for shipping which are coordinated among the various types of transportation and to create a unified dispatcher control over shipments.[1] The given version of the organization of centralized direction of all types of transportation in a front, first of all, also does not provide a solution to the problems of preparation of the transportation network. Secondly, such a directorate is very unwieldy and inefficient: it will fetter the operations of the transportation services. Thirdly, the authors of the proposals do not indicate the subordination of the transportation directorate of a front, while the solution to this problem has considerable significance.

A third version of the organization of unified direction of the various types of transportation is proposed. The overall direction of the preparation and use of all types of transportation is centralized directly in the hands of the deputy to the commander of troops of the front for the rear area with the chiefs of the military transportation services directly subordinate to him. It is considered that the chief of the rear area of the front must be in charge of all types of shipments (including operational) and also of the march movements of troops along the military vehicular roads of the front.

---

1. Lieutenant-General I. Kovalev, Major-General P. Bakarev, Colonel K. Pavlovich. "Problems of Transportation in a Modern War," Special Collection of Articles of the Journal "Military Thought", 1960, Third Issue.

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

It is proposed to accomplish the organization and control of mutual coordination of the preparation of the various types of transportation and their comprehensive use for supporting operations in the transportation directorate of the rear area staff of the front. Thus, unity of overall direction of the preparation and use of all types of transportation coincides with the known independence of each of the services, which are specialized according to types of transportation.[1]

One can agree with such a version of the organization; however, in our opinion, the transportation directorate should not be directly subordinated to the chief of the rear area staff of a front. It is known that up to the present time, the organization of military shipments of various types (for example, operational and supply) is charged to various organs (the staff of a front, the rear area staff of a front). In this situation, it is advisable to have the transportation directorate immediately subordinate to the commander of troops of the front. This guarantees unity of direction of the preparation of the transportation network of the front for the support of operations and its use for carrying out all types of military shipping.

New means of action against the transportation network give rise to the necessity for changes in the methods and means of ensuring the continuity of shipping.

In a modern war, a wider dispersal of shipping is required — i.e, dispersal of communications routes, of various technical installations, and of shipping means.

Parallel communications routes of various types should be dispersed so that in cases of lengthy interruptions of traffic on one of them, continuity of traffic on the others is preserved. Along with this, it is necessary to ensure a capability for transferring flows of shipments from a route put out of commission to those still operative.

---

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

In order to prevent lengthy interruptions of through traffic of trains and motor convoys resulting from the destruction of major cities (and corresponding transportation centers), railway and vehicular bypasses should be prepared in advance at a sufficient distance from these cities. Moreover, provision must be made without fail for the use of these for national economic shipments in peacetime which will enable us to avoid immobilizing capital investments. It is also necessary to prepare in advance rail and vehicular road approaches to places at which temporary bridges and crossings over major river barriers are constructed in case permanent bridge crossings are destroyed.

In the period of threat, and even more at the beginning of a war, the greater amount of loading and unloading work, the preparation of shipping means, support of transported troops, etc., must be taken beyond the limits of transportation centers in the shortest period of time. For this, it is necessary to prepare in advance appropriate stations, wharves, and airfields at their approaches and to provide support for them with forces and means.

In order to have a capability of using for shipping undamaged sectors of railways and internal water routes bordering on destroyed installations, it is necessary constantly to maintain an undiminished quantity of rolling stock, fuel, and materiel at these sectors in wartime.

At the beginning of a war, in order to effect reconstruction and construction work on routes of communications, powerful, highly productive means, capable of accomplishing these tasks under conditions of mass destruction and in contaminated areas will be required immediately.

The primary efforts of reconstruction personnel, especially in zones near the front and in the rear area of the country, are required in order to concentrate on overcoming large "barriers" which obstruct transportation traffic. The main task in this will consist of restoring communications between the sectors of the network bordering on "barriers". This task can be accomplished most successfully by the comprehensive use of

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

the reconstruction, construction, operational, and shipping resources of rail, vehicular, pipeline, water, and air transportation for overcoming obstructed areas. All work in the reconstruction, development, putting into operation and use of the transportation network in each area should be accomplished according to a unified plan and be continually coordinated.

A very important role in overcoming "barriers" can be played by special means of transporting railroad cars: trailers with a large load-carrying capacity (up to 100 tons), special ferries, ferries made from barges and pontoons with rails laid on them for carrying cars across large rivers when bridges have been destroyed, helicopters with a large load-carrying capacity, etc.

The existence of such means permits a sharp reduction in the volume of work in preparing temporary shipment areas, the avoidance of duplicate shipments, and a significant increase in the speed of restoring communications between railway sectors bordering a destroyed installation.

It is obvious that the preparation of transportation for war and specifically for supporting the strategic concentration and deployment of troops has now become much more complex than before and has acquired new peculiarities. Among the most important of these are the following:

1. In the initial period of a modern war, as in other periods, shipments for strategic concentration and deployment can be accomplished only by the combined use of various transportation means. Therefore, close mutual cooperation and continuous coordination of their preparation for working jointly in wartime has become absolutely mandatory. One of the most important conditions for success in preparing and using the transportation network for military purposes is the organization of unified operational direction of the work of all types of transportation on the territory of each front, district near the front, and internal area of the country.

1.3(a)(4) [redacted]

[redacted] 1.2(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

2. Paramount significance is acquired by the maintenance at the beginning and during the course of a war of the viability and working capability of the network and continuity of shipments in theaters of military operations and in the rear area of the country. In the prior development of the transportation network for military purposes, it has become essential first of all to ensure a capability for wide dispersal of shipments, for carrying out freight and other work from transportation centers, for the rapid transfer of a flow of shipments from one type of transport to others, and for the restoration in short periods of time of communications between sectors of the network bordering on destroyed installations.

3. The role of special (reconstruction, construction, shipping) means of overcoming major "barriers" bordering on communications routes in the very first hours of war as a result of nuclear strikes has sharply increased. The creation of such powerful and highly mobile means during the advanced preparation of the transportation network is now much more logical than prior development of installations within centers, increasing the number of permanent bridge crossings over major rivers, etc.

This means that in solving the problems of strategic concentration and deployment of the armed forces, it is absolutely essential to consider new indices of preparedness of the transportation network for work during the initial period of a war, the actual possibilities for the combined use of all types of transport, the maintenance of the necessary working capacity and mobility of the transportation network, and the continuity of shipping. Only on the basis of an analysis of these data can one make a correct estimate to provide for strategic concentration and deployment from the standpoint of transportation and derive from this estimate wholly valid conclusions.

On the Problem of the Tasks of the Navy and Methods for Accomplishing Them

by

Admiral V. Kasatonov

In Admiral V. Platonov's article "On the Tasks of the Navy and Methods for Accomplishing Them,"* he cited several important propositions about naval operations in a future war. In our opinion, however, several of them are debatable, and in connection with this we want to set forth our opinion of them.

In examining the task of destroying carrier strike large units, the author expressed doubt that their combat activities would be carried out mainly on the open sea. We think there is no basis for such a doubt.

In the opinion of Western military specialists, besides the large units of fire of nuclear warheads (more than 100 nuclear bombs on each aircraft carrier), the strength of carrier strike large units is precisely their great maneuverability and their ability to deliver strikes with nuclear weapons on a broad front. It is precisely for this reason that they consider carrier strike large units a more reliable and stable means of combat in comparison with shore-based aircraft and ground missile units.

It is not without reason that the NATO command thinks that ground airfields and areas of missile launch sites can be reconnoitered even before the beginning of combat operations and subjected to powerful strikes by nuclear missiles in the initial hours and minutes of a war. Carrier strike large units, however, are capable of performing a maneuver of 1000 km in one calendar day in any direction and are less vulnerable. For the present they cannot be destroyed by missile strikes from the shore, and the reconnaissance of carrier strike large units on the sea and the directing of submarines and aircraft against them is a very complicated task.

---

* Special Collection of Articles of the Journal "Military Thought", Issue Two, 1961.

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

The experience of numerous exercises of the carrier strike fleets of the USA and the NATO joint naval forces proves that the basic method of operations of carrier strike large units is their delivery of strikes from areas on the open sea. In particular, at the maneuvers of the NATO joint armed forces which were held in autumn of 1960, aircraft carriers participating in the general nuclear attack delivered their strikes against very important objectives of the "enemy" from a distance of up to 2000 km in a zone with a front of up to 1700 km. Here the carrier strike groups constantly maneuvered within the bounds of the Norwegian Sea and combined the maneuver with measures of radio silence in the networks of long-range radio communication. The American 6th Fleet operated in a similar way in the Mediterranean Sea.

It is possible for the carrier strike large units to put in to shore waters, particularly into shore bases, only in particular cases. Usually the carrier strike groups put in to render direct support to ground troops, particularly to put ashore an amphibious landing force. For example, that was the reason why the strike aircraft carriers entered the Aegean Sea in the final stages of the concluding maneuvers of the NATO joint armed forces (OVS) in 1957 and 1960.

It should be borne in mind that by operating in shore waters with fiords, all other enemy ships can be camouflaged successfully against the background of islands or the shore, but aircraft carriers will be exposed when their aircraft take off. Besides that, they can be detected by intelligence agents. As an example of this, one can cite the constant surveillance conducted by our and the British intelligence during the past war of the large German ships in the Norwegian fiords. Under modern conditions, after having been discovered in areas which are too small for maneuvering, aircraft carriers can be destroyed with great accuracy by nuclear strikes from missile troops. It is clear that the enemy will try as far as possible to avoid such areas.

One cannot quite understand the author's idea that in remote areas of the ocean, "carrier strike large units can function only as cover forces for convoys or within

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

1.3(a)(4)

[redacted]

the complement of hunter-killer groups of the antisubmarine defense" (Page 3). As is well known, the carrier strike large units, like the fleet strike force, are intended not to cover convoys but to deliver strikes against important military, industrial, and administrative installations and against ports and naval bases. They are also capable of delivering strikes against ships and vessels on the sea. From whom can carrier strike large units conceal convoys in remote areas of the ocean? It is obvious that such a task could be given the carrier strike large units only if the probable enemy could expect attacks against his convoys from large surface vessels, for example, from aircraft carriers. Because the probable enemy does not expect such operations from us, one can suppose that he will not charge the carrier strike large units with such tasks.

Covering convoys and carrier strike large units from submarine strikes is carried out by carrier hunter-killer groups which are especially assigned for this purpose, and at the basis of these groups are not strike aircraft carriers but aircraft carriers of the antisubmarine defense.

By using the carrier hunter-killer groups, the enemy, as was correctly noted by Admiral V. Platonov, of course will strive to clear our submarines from the areas where carrier strike large units are maneuvering. However, one must not overestimate his capabilities for accomplishing this task. The areas where the carrier strike large units are maneuvering are quite large and occupy hundreds of thousands of square kilometers. Moreover, one must inspect not only the areas of combat maneuvering but also the areas where the strike fleet is formed, where ships are refueled, waiting areas for servicing, and areas with the routes of the carrier strike large units and other operational groups of the strike fleet. Even the successive execution of preliminary searches in these areas to clear them of submarines would require bringing in tens of carrier hunter-killer groups of the antisubmarine defense, and this exceeds the bounds of the real capabilities of the probable enemy, particularly if one considers that such operations must be carried out simultaneously in several zones of the world ocean.

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

For reliable, direct protection of carrier strike large units and convoys operating in antiatomic combat formations, one also must have a large number of antisubmarine forces and weapons.

Despite the fact that our probable enemies have at their disposal a developed shipbuilding industry, their capabilities for building the needed number of ships and planes of the antisubmarine defense to fight our submarines are not limitless. These capabilities can be limited even more as a result of strikes by missile troops and by missile submarines against the centers of the shipbuilding industry and the bases of the enemy's antisubmarine forces.

We are completely aware that the operations of diesel-electric submarines, particularly against carrier strike large units and fast, strongly protected convoys, will be conducted with great difficulties. However, even these submarines will be able to operate successfully against less fast-moving targets.

The operations of atomic submarines will undoubtedly be more effective. The great maneuvering capabilities and the enormous range of these boats make it possible for them to be used to deliver strikes against carrier strike large units not only in areas of combat maneuvering of the latter and in the approaches to them but also on the lanes used by the carrier strike large units in crossing the ocean and on the approaches to distant bases across the ocean.

Without being inferior in speed to aircraft carriers, and exceeding the speed of the fastest convoys by 1.5 to 2 times, the atomic submarines can attack them from any direction and avoid encounters with the hunter-killer groups of the antisubmarine defense which usually take up positions in forward areas of the movement of the carrier strike large units or the convoy.

The use of atomic torpedoes increases even more the combat capabilities of the submarines. Incidentally, we cannot agree in any way with Admiral V. Platonov in his negative evaluation of atomic torpedoes, much less

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

the long range ones (Page 9.). The advantages of atomic torpedoes are obvious. Thus, to destroy a ship of any class, it is sufficient to strike it with one atomic torpedo within a semicircle with a radius equal to the radius of destruction of the given target. We note that to destroy any ship such as a strike aircraft carrier, we must hit it with no less than 8 to 10 torpedoes with conventional filling. As a result of the fact that to destroy a ship with an atomic torpedo, it is sufficient not to guarantee striking the ship directly but in a semicircle with a sizable radius, the probability of destroying the target with this torpedo increases greatly and in several instances approaches one.

Finally, one must keep in mind that in using torpedoes with conventional charges, because of their small radius of destruction, the firing is usually done by four-torpedo salvos, but in using atomic torpedoes the firing is done with single torpedoes. Therefore, if a submarine replaces conventional torpedoes with atomic ones, then with the use of the same number of torpedoes, the number of possible effective attacks increases by four times, i.e., the self-sufficiency of a submarine in ammunition increases by four times.

Considering the great self-sufficiency of carrier strike large units, which is reinforced by the mobile system for supplying and servicing them on the sea, the basic efforts by our Navy must be directed at fighting them on the open sea and ocean; at the approaches to probable areas of combat operations, directly in those areas, and also on the ocean lanes used by the carrier strike large units from remote rear bases and at exits from those bases.

We think that by using and clearly organizing a sufficient amount of forces and means of reconnaissance, the successful operations of our forces -- submarines and aircraft -- can and must be organized against the carrier strike large units on the open sea.

It is also difficult to agree with the author of the article on the evaluation which he gives of the long-range possibilities of atomic aircraft (Page 4). In our opinion,

[redacted]

1.3(a)(4)

[redacted] 1.3(a)(4)

the insufficient range at low altitudes and the low self-sufficiency of modern aircraft, even the largest jet aircraft, is a serious hindrance impeding their use in distant areas of the ocean in coordination with submarines. The impossibility of long flights at low altitudes to a considerable degree causes the great vulnerability of modern aircraft to anti-aircraft weapons.

Apparently, aircraft using atomic energy will be able to fly for quite a long time at low altitudes and at any distance from their airfields, and they will be shot down much less frequently by antiaircraft weapons than were their piston and jet predecessors.

According to theory, , the atomic airplane can become an almost invulnerable and quite effective weapon of armed combat on the sea in conducting combat operations against a carrier strike large unit, convoys, and missile-carrying submarines.

One must keep in mind that a missile-carrying aircraft possesses a very valuable feature -- in launching its missiles it itself observes the objective of the strike and directs the missile to the target, i.e., it operates without any intermediate means, and because of this, errors in determining the location of the target by reconnaissance means are excluded, as well as any influence on the accuracy of the firing by the movement of the target during the missile's flight.

We basically agree with the opinion of Admiral V. Platonov about the degree of threat from enemy missile-carrying submarines and on the ways of combating them at the modern stage of the development of our antisubmarine defense forces and weapons. It is true that at the present time the real strength in the fight against missile-carrying submarines can be fast submarines of the anti-submarine defense which are specially equipped to accomplish this task. There is also no doubt about the methods of combat operations of antisubmarine submarines proposed in the article.

However, one cannot completely agree with the author of the article when he says that there is no other way to

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

combat missile-carrying submarines. In our opinion, the use of a single weapon (the submarines of the antisubmarine defense) in the struggle against such a formidable enemy as missile-carrying submarines is an emergency measure caused by the status and capabilities of the antisubmarine forces and weapons at the given moment.

Although possessing several indisputable advantages in comparison with other forces of the antisubmarine defense, the submarines of the antisubmarine defense also have their shortcomings. The chief shortcoming is that even with the sharp increase in the range of detection of submarines by hydroacoustic means of surveillance, detailing submarines of the antisubmarine defense for the reliable accomplishment of this task must be excessively large and must amount to not tens but hundreds of atomic submarines. This, obviously, cannot be guaranteed for a comparatively long time. Moreover, having predominance in the world ocean in surface and air forces, the probable enemy can use, in his fight against our submarines, besides his own submarines of the antisubmarine defense, surface ships, dirigibles, and aircraft of the antisubmarine defense from land bases and from aircraft carriers. This will place our submarines of the antisubmarine defense in an unequal position with the enemy submarines, and this even further decreases the reliability of accomplishing the task of combating them.

On the basis of these considerations, it is extremely desirable to bring in other forces besides the submarines of the antisubmarine defense for the struggle against missile-carrying submarines. These should be forces which would be able as much as possible to compensate for the shortcomings inherent in antisubmarine submarines.

In this plan we do not share the very pessimistic evaluation expressed by Admiral V. Platonov regarding naval aviation. It is obvious that, provided the means of detecting submarines by aircraft are improved, and the flight range of aircraft at low altitudes is increased, aircraft will be able to increase the effectiveness of the struggle against missile-carrying submarines in coordination with submarines of the antisubmarine defense.

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

Apparently, the new possibilities in accomplishing this important task may take into account orbital means of combat which are based on the use of artificial earth satellites.

In our opinion, the essence of the problem is to create effective means for the distant detection of submarines from the air which will make it possible to employ for their destruction the most effective modern means of destruction -- missiles with nuclear charges launched from submarines or aircraft and possibly also from shore launching mounts.

It would be incorrect to rule out the possibility of creating other means of detection. Considering the great seriousness of the threat of missile-carrying submarines for our country and the other countries of the Socialist Camp in the event a war breaks out, we must set such a task before Soviet scientists.

Thus, as the bases for accomplishing the task of combating missile-carrying submarines, we must place not just one means of combat, but a set of means, the main ones of which are submarines, aircraft, and possibly, orbital means of combat.

In examining the task of combating enemy ocean transportation, the author of the article maintains that under modern conditions the need arises to choose, as the main objective for strikes by our forces, not transports, but aircraft carriers (Page 8). We cannot agree with that statement. In our opinion, it is caused by an obvious overestimation of the capabilities of our probable enemy to cover and defend his convoys. For this purpose the enemy may use aircraft carriers only within the complement of carrier hunter-killer groups or for direct safeguarding to protect only a relatively small number of the most valuable convoys. A considerable number of convoys and transports will follow the ocean lanes without cover by aircraft carriers. (We have already mentioned that carrier strike large units have a very small bearing on the direct protection of convoys.)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

Moreover, it is quite difficult to guarantee the selective destruction of aircraft carriers among all the ships and transports of a convoy, even from a purely tactical viewpoint. It is obvious that submarines armed with torpedoes will launch their torpedoes against the nearest large ship or transport during an attack, and strikes by missiles with nuclear warheads from submarines and aircraft must be delivered against the main body of the convoy, i.e., against the transports, calculating on destroying as many of them as possible. Any other solution of the task is scarcely admissible.

Of course, when one has the opportunity to choose between attacking either a transport or an aircraft carrier, preference should be given to the latter. However, in principle, the main objectives for strikes by naval forces in combat with enemy ocean shipping, just as previously, remain the transports with troops and cargo, and the task of disrupting shipping can be accomplished only by destroying a definite proportion of the enemy's transport tonnage.

Classical Military Art and Nuclear/Missile Warfare*

by Major-General of Artillery I. Dzhordzhadze

The principles of military art which have been in existence for centuries and which have become classical and seemingly unchangeable must undergo basic changes under the conditions of conducting nuclear/missile warfare.

Moreover, among us there has arisen the idea that research directed at studying the nature of a future war and the special features of conducting operations will be done within the framework of the principles of military art which have already been formed and which prevail over military research and limit the extent and resolution of their scholarly and practical conclusions. In all works of theory which have been published, there is no lack of recognition of the significance of nuclear/missile equipment and of its main and decisive role. However, the whole meaning of the all-determining role of nuclear/missile weapons, a role which is recognized in theory, disappears when in practice these weapons are scattered among old arms of troops with the purpose of supporting infantry and tank operations.

That is why we consider it necessary to examine the problem of whether it is possible to put the new theory and practice of nuclear/missile warfare within the framework of classical military art or whether a new military art -- the art of nuclear/missile warfare -- must be created to replace the old one.

At first it should be ascertained whether the most effective use of new weapons can be made if they are in the complement of old arms of troops.

We are excluding this possibility. If motorized rifle and tank troops are given nuclear weapons, then

*The author has in mind that part of nuclear/missile war which is conducted within the framework of front operations, and he calls it field warfare.

[redacted] 1.3(a)(4)

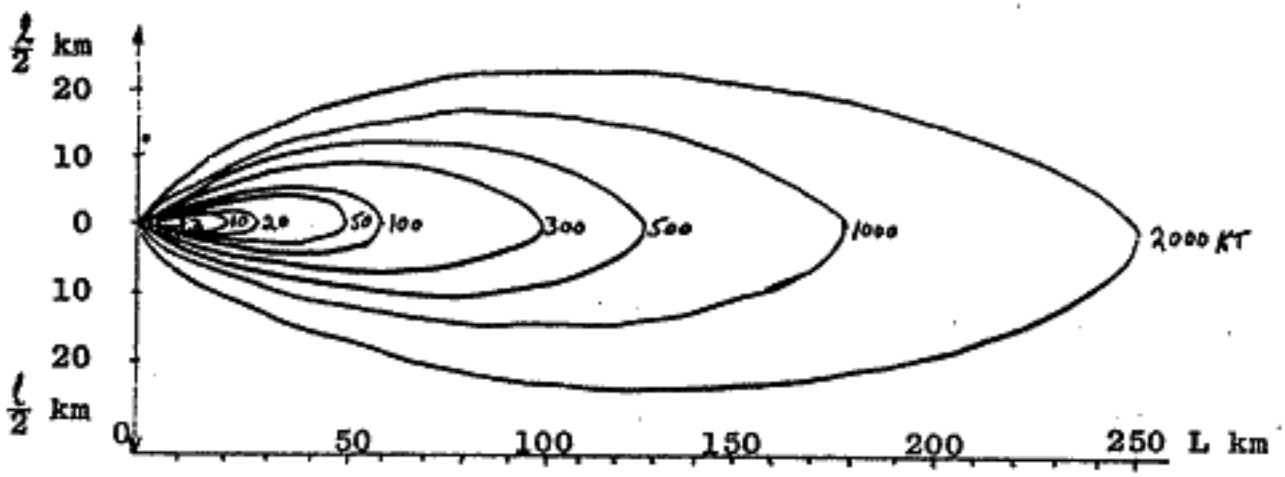
[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

still, because of the limited capabilities of the infantry and tanks, they will not be able to use the powerful combat features of the new weapons.

As can be seen from Figure 1, 3 two-megaton blasts in combination with 8 half-megaton blasts can destroy everything living and for a prolonged period exclude the possibility of troop combat operations over an area where a field army of the USA is located (23,000 km^2).



It is obvious that after conducting such a nuclear strike there is no need at all for operations over the contaminated territory by infantry and tanks. However, according to all existing canons of classical military art, the infantry and tanks should operate under these conditions, because it is they who are called upon to destroy the opposing enemy forces and carry out his final rout according to the principles for waging armed combat which have been developed.

Figure 1. The number of nuclear bursts needed for the radioactive contamination of ground with a radiation dose of 300 roentgens and a wind speed of 50 kph.

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

How can one combine in the same area large nuclear bursts which create high radiation levels with strikes by the infantry and tanks? There is only one solution -- to limit the force of nuclear weapon bursts to levels which would not prohibit operations by our own infantry-tank groupings and at the same time would ensure their advance.

Thus, the classical military art of waging infantry-tank warfare forces us to employ a whole arsenal of small nuclear weapons, starting at one kiloton, and limits the use of large bursts. In connection with this, there arises the need to create large supplies of small nuclear warheads, thousands of which would be needed for an operation, and actually issue 200 to 300 to a front. As a result there arises the completely distorted idea that there is always a shortage of nuclear warheads, whereas correct technical and operational calculations on the use of large bursts show that there is a quite sufficient amount of nuclear weapons at the front to accomplish all the tasks in a true nuclear/missile war.

From Figures 1 and 2 one can see that a field army of the USA can be destroyed by 3 two-megaton and 8 half-megaton bursts or 1,653 three-kiloton and 20 half-megaton or 5,143 three-kiloton bursts.

In this it should be stressed that nuclear bursts of high yield make it possible to destroy troops over an enormous area, and thus eliminate the need to seek out and destroy each individual target. Small nuclear bursts, however, are used to destroy specific targets, and this actually is a return to the practice of fire of tube artillery.

Small nuclear weapons do not ensure the complete destruction of the enemy as a whole, but accomplish only a part of this task and leave the achievement of the ultimate purpose to the infantry-tank grouping, whereas, by using nuclear weapons of large yield, one can completely accomplish the task of destroying the enemy in a very short time.

Consequently, there is no justification for striving, by artificial limitation of the technical capabilities of nuclear weapons, to create conditions for simultaneous operations in the same zone with them and with motorized rifle and tank units and large units.

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

It is inadmissible to have the large variety of small nuclear warheads now used in exercises, and their adaptation to the infantry and tanks simultaneously determines the large variety, also, of missile equipment. The correct technical and operational use of powerful nuclear bursts, however, limits the amount and variety of missile equipment and makes it possible to regulate its yields, having created a group of systems which is small in number.

The large amount and variety of nuclear/missile weapons and their adaptation to the old unwieldy system of controlling infantry-tank operations result in the need to create a large number of automated control systems which become completely unnecessary under the correct conduct of nuclear/missile warfare. Indeed, if the number of nuclear/missile weapons of great yield which are being used is not large, and if the functions of control of nuclear/missile weapons and infantry-tank groupings are clearly limited, then there will be very few installations for automating control of the new weapons, because one can control the old arms of troops without high-speed automated devices.

Thus, one can consider that to a large extent, within the framework of classical military art, the combat capabilities of the new equipment are paralyzed; the use of more effective and economic nuclear warheads of great yield is limited; unnecessary and expensive work is done to create an enormous arsenal of missile weapons which are adapted for the mass use of small nuclear warheads; and for all new and old arms of troops (despite the high speed demanded for this) there are being created numerous electronic machines, although there is no need to automate and complicate all the processes of controlling old arms of troops to an identical degree.

All this has a negative effect on carrying out a new military and technical program.

To give scope to the new military equipment and to determine the correct program for working it out and introducing it, one must decisively reject the use of obsolete canons of classical military art which obstruct

1.3(a)(4)

I and II

1. Each individual target is reconnoitered and destroyed.

2. Cooperation of all arms of troops consists of coordination of troop operations in one zone according to target, place, and time.

3. There is the massing of basic forces and weapons on one or two axes.

4. The system of controlling joint operations of individual arms of troops and weapons for combat is awkward; command posts are unwieldy, have little mobility, and are overloaded with support subunits.

5. There is the presence of millions of ground troops and an enormous amount of varied armaments and equipment within the complement of a front. There are enormous materiel expenditures and complexity in supporting operations.

Conclusions

1. There is no basic difference between former times and now in organizing and conducting troop combat operations and in the procedure and sequence of destroying targets. Despite the existence now of nuclear/missile weapons, everything remains at the level of prenuclear warfare (the only difference is that more powerful ammunition is used). The mechanical unification of the old and new military art has doubly complicated the conditions of conducting an operation, whereas nuclear/missile weapons objectively simplify these conditions.

2. The simultaneous operation of infantry-tank groupings and of nuclear/missile weapons in the same zone paralyzes the technical capabilities of nuclear weapons and gives rise to a shortage of small nuclear warheads.

3. The artificial subordination of nuclear/missile weapons to infantry-tank formations results in maintaining a large number of infantry-tank troops and old weapons of destruction and limits the development of new arms of troops.

[redacted]

1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

III

1. Groups of targets over a large area (in continuous zones) are reconnoitered and destroyed. Thanks to the use of large nuclear bursts, the possibility of a shortage of nuclear warheads will be eliminated.

2. Coordination consists of the most efficient distribution of the efforts of nuclear/missile and infantry-tank groupings according to zones.

3. A careful demarcation of tasks and the specialization of control of new and old arms of troops sharply reduces the organs of control. To control a nuclear/missile army there must be a single set of high-speed machines. Nuclear/missile strikes which are based on large bursts are simple in their planning and conduct.

4. Ground troops are sharply reduced. To combat a ground enemy one must have both a nuclear/missile and combined-arms army.

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

the efficient use of nuclear/missile weapons. Instead of this, one should work out new technical, operational-tactical, and organizational bases for waging nuclear/missile warfare.

First of all, the new equipment itself shows that not every war which envisages the use of nuclear and missile weapons can be called a nuclear/missile war. Thus, if one uses small nuclear bursts for fire support of infantry and tank operations, this will not be a nuclear/missile war but a somewhat modernized infantry-tank-artillery war.

The calculations cited in Figure 1 show that the most effective energy equivalent for a nuclear burst under field conditions is an equivalent within the .5 to 2 megaton range. In our opinion, this indicator should be acknowledged as the technical criterion of a genuine nuclear/missile war. All the other, smaller bursts must be considered of an auxiliary and incidental nature.

The needed yields of large nuclear bursts and their combination will be determined basically by the accepted plan of radiation contamination of large areas and by the conditions of the combat and meteorological situation.

In the event that 3 two-megaton and 8 half-megaton nuclear bursts are used against a field army of the USA, continuous radiation zones will be formed (Figure 2) with deadly radiation levels. This ensures the reliable destruction of enemy personnel and completely excludes the possibility of his maneuvering, because the radiation zones will have the most fantastic shapes, forming an intricate maze.

The procedure for conducting nuclear/missile strikes envisages creating continuous zones of nuclear destruction of personnel over large areas with high radiation levels. The personnel of all arms of troops will not be able to operate on ground with such high radiation levels, and, consequently, even the conventional combat equipment will be useless. Under these conditions, there is no longer the need for additional physical destruction of enemy personnel by other means and arms of troops, just as there

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

also is no need for the destruction of the basic part of his combat equipment. Over the enormous areas of the continuous zones of nuclear destruction there is the need primarily to conduct operations of a checking and reconnaissance nature by the forces of bombardment and reconnaissance aircraft in combination with the operations of special groups of airborne forces. Special motorized detachments equipped with special vehicles, equipment, and protective devices can be used occasionally in this area.

The basic task of checking and reconnaissance operations must be to detect and destroy enemy nuclear/missile weapons operating with the aid of remote control and automatic systems without human assistance according to a prior given program.

The procedure and sequence of combating enemy missile troops will also change: at first, antiaircraft guided missiles will be destroyed and then surface-to-surface ones. This will open the possibility for the operations of all arms of air reconnaissance, whereas now antiaircraft guided missiles exclude the combat work of reconnaissance aviation, and this paralyzes all the reconnaissance activities of the front.

Thus, by creating continuous zones of nuclear destruction, the nuclear/missile troops are capable of independently performing the basic task of destroying the enemy over large areas. It is our profound conviction that the operations of large infantry-tank groupings in these zones are inadvisable and even impossible.

Consequently, the need arises to limit the zones of operations of the nuclear/missile and infantry-tank troops according to area instead of the existing principle of joint operations of new and old arms of troops.

Nuclear/missile troops plan and conduct a program of large bursts which create the desired picture of the radiation situation simultaneously over the whole area where the enemy troops are located. The picture of the

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

zones of complete enemy nuclear destruction will change depending on the given system of layers (sloynost) and t the zones of radiation contamination, as well as the combat and meteorological situation. Variations of the plan for nuclear/missile strikes will comprise the basis of the program for conducting large bursts. These programs may be fed into existing computers in advance, and in an instant one can receive the best solution corresponding to the specific situation.

Thus, over the enormous areas where enemy troops are located, one can create a radiation situation in the tactical and operational depth in which enemy personnel would be in continuous radiation zones and would be broken up by zones with deadly radiation levels.

In our opinion, the art of determining and forming such continuous zones of nuclear destruction over enormous areas comprises the basis of military art in nuclear/missile warfare.

In the zones of continuous nuclear destruction, one can provide special corridors free from radiation contamination for the operations of our own infantry-tank and other troop groupings.

These troop groupings can be set aside for occupying enemy territory which is free from high radiation levels. They use and develop the success of the enemy's defeat which was achieved by large nuclear bursts. Therefore, we consider that the main task -- the destruction of opposing enemy forces -- can be accomplished independently by nuclear/missile troops, but the occupation of enemy territory, the consolidation of the success, and support for conducting nuclear/missile strikes can be done by combined-arms groupings equipped with ordinary weapons.

In our opinion, such an efficient distribution of efforts of new and old weapons according to ground, target, and tasks guarantees success in waging nuclear/missile warfare. With this, it must be kept in mind that under the conditions of nuclear/missile warfare one must inevitably

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

force from the battlefields the basic masses of infantry-tank and other troops equipped with conventional weapons and together with them their complex and unwieldy tactics and operational art and strategy, and one must confirm the new military art based on nuclear/missile methods for waging armed battle.

The purpose of any operation is to destroy the enemy. And we think that this destruction can and must be achieved, not by infantry-tank encirclement and splitting enemy troops, but by destroying them with nuclear weapons. The mighty combat powers of nuclear weapons simplify the strategy of destruction and, on the battlefield, remove the borders of tactical, operational, and strategic scales.

In delivering strategic nuclear/missile strikes, if one must select targets, then in the zone of combat operations of the fronts one must and can use their complete destruction by large nuclear bursts. We consider that we must put a decisive end to conducting front operations by old methods. Old arms of troops and methods of their combat use must be improved, and they must be adapted to the best use of the results of employing nuclear/missile weapons. But one cannot achieve decisive purposes in operations by expanding the capabilities of old arms of troops through equipping them with new weapons but by the unification of everything new (all types of weapons of mass destruction, missile and other means to deliver them, and reconnaissance means) into a single nuclear/missile army which is capable of destroying opposing enemy forces by crushing blows. Simultaneously with this, one must reduce sharply the troops equipped with conventional weapons, and unify motorized rifle, tank, and other conventional troops into homogeneous, combined-arms large units with a limited amount of armament. The basic tasks of these new combined-arms large units and formations will be to occupy enemy territory, consolidate the success achieved by the nuclear/missile strikes on areas free from high radiation levels, and to provide ground cover for a nuclear/missile army and for other troops on their own territory. Thus, the combined-arms large units will not be forced to wage battles and combat

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

with the main enemy forces as this was understood in the past. There will have to be an occasional use of transport aviation to move combined-arms large units by air to cross zones with high radiation levels.

Large nuclear bursts will reduce to a minimum the number and variety of nuclear and missile weapons. Basically there will have to be nuclear warheads of three types: half-megaton, one-megaton, and two-megaton, and correspondingly with them, three types of missiles with a firing range of up to 1000 km. It is technically more advisable to use fixed strategic missiles for a greater distance.

Thirty to forty launching mounts are able to create a continuous zone of nuclear destruction on the scale of a front. As can be seen, the number of launching mounts with ready missiles is not large. However, for their reliable use and support one must have a whole nuclear/missile army which should include: nuclear/missile divisions, a division for comprehensive reconnaissance -- to receive and clarify reconnaissance data -- checking and reconnaissance divisions conducting special operations over the zones of complete nuclear destruction, divisions of field cover for nuclear/missile troops, and technical and supply units and large units.

Thus, all the basic forces set aside to fight against a ground enemy can be united into two armies: a nuclear/missile army and a combined-arms army. The decisive and leading role of the commander of the nuclear/missile army is obvious, and therefore he will have to coordinate the operations of these armies. Apparently, there will be no need to create an unwieldy front directorate with general control functions. It is enough to supplement the command of the nuclear/missile army by a coordination group to establish agreement for operations on land and in the air.

It is natural that the methods and forms of military art which are based on the principles for waging nuclear/missile warfare under field conditions will exclude several generally accepted classical propositions, and the old

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

and new can be compared in Figure 2.

In our opinion, victory in field warfare will be achieved by that side which first goes over to genuine nuclear/missile warfare and takes advantage of the blunders of an enemy who adheres to the old principles of infantry-tank warfare. Thorough exploitation of enemy mistakes which stem from the old inherited principles of waging war, particularly in the initial period, will comprise a very important part of the new military art.

If we begin now to reorganize our armed forces in accordance with the principles of military art of genuine nuclear/missile warfare, then we shall gain several years and shall outstrip the most highly developed armies of the world in this regard.

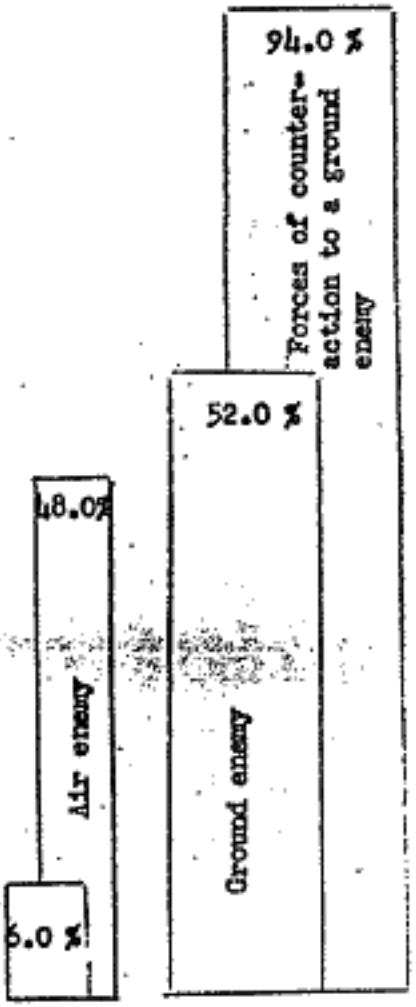
* * *

The problems of combating missile and aviation delivery means in the flight trajectory in the air and space are the element of nuclear/missile warfare which has been least resolved.

Investigation of the nature and operations of a probable air and ground enemy and a comparision of them with the capabilities of our ground troops reveals a sharp discrepancy between our forces of counteraction and the forces of enemy air invasion.

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)



[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

Table 1

Proportion of Air and Ground Attack of an Army of the USA and the Forces of Counteraction of the Ground Troops of the Soviet Army

		Means Used	Proportion of the strike and of the forces of counteraction to it, percentage		
			Field Army (Army)	Gr. of armies (front)	Avg. prop.
Proportion of the air attack of an army of the USA, percentage	Nuclear weapons	Cruise missiles Guided missile and free rocket aircraft	60	51	56
	Conventional weapons	Aircraft	46	35	40
	Average proportion of the strike		53	43	48
Proportion (percentage) of the forces of counteraction (antiaircraft troops of ground troops of the Soviet Army in relation to the whole complement of large units(formations) of ground troops			7.2	8.4	6*
Proportion of ground attack of an army of the USA, percentage	Nuclear weapons	Ballistic missiles; Cruise missiles Artillery	40	49	44
	Conventional weapons	Artillery	54	65	60
	Average proportion of the strike		47	57	52
Proportion of forces of counteraction of the Soviet Army			92.8	91.6	94

*This shows the average arithmetical calculation of the proportions of the complement of the means of the PVO (according to the number of weapons and launching mounts) motorized rifle divisions, tank divisions, heavy tank divisions, army, and front

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

These calculations (Table 1) show that the proportion of means of enemy air attack in the use of nuclear and conventional weapons comprises 48 percent and the means of ground attack 52 percent, while our forces of counteraction to an air enemy on the flight trajectory (PVO troops) comprise only 6 percent of ground troops, and to the ground enemy, 94 percent.

Thus, one can observe an obvious discrepancy between the complement of our ground troops and the nature of operations of the air and ground enemy. The operations of the probable enemy bear a typical air-ground character with an almost equal ratio of the yield of strikes from the air and on the ground. The counteraction of our ground troops, however, essentially has a one-sided, ground nature, with an obvious shortage of the forces of counteraction to the air enemy.

One observes a different picture in examining the forces of counteraction of our probable enemy (the army of the USA) (Table 2).

The proportion of our means of air attack of a front in using nuclear and conventional weapons comprises 27 percent and the means of ground attack, 73 percent.

Forces of enemy counteraction to an attack of our troops from the ground

*This shows the average arithmetical calculation of the proportion of the complement of the means of the PVO (according to the number of weapons and launching mounts) of infantry divisions, armored divisions, [2 letters missing], infantry corps, and of a group of armies

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted]

1.3(a)(4)

The forces of enemy counteraction to our means of air attack (antiaircraft guided missiles and antiaircraft artillery), however, comprise 25 percent of his ground troops, and to the means of ground attack, 75 percent.

Thus, the complement of enemy ground troops almost completely corresponds to the probable nature of our strikes against him. Taking into consideration the pronounced ground-air nature of the possible operations of our troops with a prevalence of ground strikes over air strikes by about 2.7 times, the counteraction of the enemy also has a pronounced ground-air nature with the predominance of the forces of counteraction to a ground attack over the forces of counteraction to an air attack.

Consequently, there is a sharp discrepancy between the complement of our ground troops and the nature of the possible attack from the air, something which is not observed among our probable enemy. This discrepancy which has arisen must be eliminated by a sharp increase in the PVO troops of the ground troops and in our means of air attack.

The air-ground nature of nuclear/missile warfare is a new, specific, and more complex side to the matter. The successful struggle in the air and the destruction of an air enemy is a decisive element in ensuring success in operations or campaigns.

PVO troops of a front who are equipped with modern nuclear antiaircraft systems act as the main force in the antimissile and antiaircraft struggle under field conditions. Antiaircraft defense of troops is now built and founded on the use of antiaircraft guided missiles. Therefore, all the old means of fighting against an air enemy can serve only as a supplement to the main PVO weapon - the antiaircraft guided missile - and in principle the new bases of the combat use of these missiles will determine the nature of the PVO troops as a whole.

Antiaircraft guided missiles make a start at creating a highly effective and constantly functioning zonal PVO system with which, instead of covering individual objectives (objective PVO), and periodic operations of fighter aviation, there is brought about simultaneously a constant cover of

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

all the numerous objectives, and the numerous linked zones of destruction of the antiaircraft guided missiles form a whole system for the struggle in the air in the zone of the whole front.

Antiaircraft guided missiles of various types are capable of accomplishing independently the tasks of fighting against all air targets, and this excludes the need to use other, old PVO means in the zone of their operations. This simplifies the conditions of coordination. By its operations, fighter aviation must supplement the PVO of the troops outside the destruction zones of the antiaircraft guided missiles.

Using electronic computers, we conducted research on the effectiveness of antiaircraft guided missile operations and of fighter aviation in a single zone and in various zones. It was discovered that in limiting the zones of operations, the effectiveness of antiaircraft guided missiles increased by more than two times.

Consequently, also under field conditions, it is becoming possible to employ the most convenient and simple principle of coordination of new and old PVO means by limiting their zones of operations according to the terrain. In connection with this, the existing belief that supposedly no single means of fighting against an air enemy can accomplish independently all the tasks of the PVO of the troops, and that there must be close coordination between completely different types of means within a single zone, is losing its force. To give independence to the new weapons in an operational-tactical and organizational manner -- this, in our opinion, is the main task of military science at the new stage of development of our armed forces.

The experience of exercises conducted with the use of electronic computers proved the great effectiveness of a constantly functioning system of zonal PVO. Together with this, there arose an urgent need for centralized control of the large forces of the antiaircraft guided missiles. The experience of exercises and the results of theoretical research confirm once more, not only logically but also mathematically, the advisability of unifying all antiaircraft guided missiles and other troops of the PVO which form a zonal system into single PVO large units and formations.

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

During recent years, however, there has been a process of reducing and splitting all troop large units of antiaircraft guided missiles and of forming separate subunits and units in place of them. Thus, there has been created a "scattering" of antiaircraft guided missile subunits of the troop PVO, and this excludes the possibility of creating a zonal PVO system. All this causes a sharp decrease in the organs and means of control of the PVO chiefs (nachalnik).

Right now the PVO of ground troops has been reduced to its minimum level for the whole history of its existence. What are the reasons for such a disastrous situation for the youngest and most progressive arm of troops?

In our opinion, the basic reason is that instead of a single, correct, integral theory for unifying and centralizing PVO troops, in practice there is being carried out a differential theory for their splitting and decentralization.

This has resulted in serious consequences -- the apparatus of the chiefs of the PVO troops of a front and of armies now must control masses of small subunits without having any resources for doing this. They were isolated from the troops and were transformed into secondary organs of combined-arms staffs, capable only of preparing the antiaircraft defense of the troops, but without being able to direct the PVO means to repel raids.

Such an imperfect organization of the PVO system for troops and of its control could not help but lead to an essentially incorrect use of the antiaircraft guided missiles -- the most reliable PVO means, which is called upon to put zonal cover into practice. Hundreds and thousands of missiles will be spent for nothing because, lacking an organizing principle and centralized system of automated control, some of the targets will be fired at by an unjustifiably large number of missiles and the next will fly with impunity over the battle formations of the troops.

By attaching the antiaircraft guided missile subunits directly to the cover objectives -- which actually also means including them in the makeup of divisions -- they are artificially transformed into a means of direct cover.

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

As a system, zonal cover is excluded, and this weakens the PVO as a whole.

The creation of an automated system of centralized control of PVO troops is one of the most important problems of the present time. Its resolution is made much more difficult if there is "scattering" of the antiaircraft guided missile units. The movement, building up of the zone of cover, the replacement of units which have been put out of action, and distribution of targets are either all excluded or will be unsystematic and inefficient.

Despite scientific and actually proven principles, it is proposed that the antiaircraft guided missile models which have not yet appeared also be split among subunits, instead of using them in a centralized way on the scale of PVO large units and formations.

We consider that the need to create a system of zonal PVO inevitably confirms the need which arose long ago to create a PVO army as a powerful means for antimissile and antiaircraft combat under field conditions.

Under modern conditions, with the enormous satiation of PVO troops of fronts with antiaircraft missile means, it would be completely correct to examine the PVO of troops as the most massive missile arm of troops and as the first PVO echelon of the State as a whole, and to devote particular attention to its development.

We must create a special industry of troop antiaircraft guided missiles, of automated groups, and a system of control; a special institute for antiaircraft guided missiles and automation; we must accelerate the introduction of troop antimissile systems; and we must create computing centers, an academy, and ranges for the accelerated introduction of mathematical methods and machines for controlling PVO troops under field conditions.

Nuclear energy as a means of destruction, missiles as means of delivery, and electronics as a means of control, are the basic components of a technical base on which modern armed forces, including the PVO troops (for antimissile and antiaircraft combat), must rest.

* *

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

The change from an army intended to wage infantry-tank warfare to an army intended to wage nuclear/missile warfare must be understood not as a document but as a very serious process arising from several military reforms.

During the history of the existence of organized armies, never has one felt so sharply the need to make new military reforms as now. Despite the fact that nuclear/missile weapons caused the need to change from infantry-tank warfare to new, nuclear/missile warfare, and thus determined the basic changes in building the armed forces, in our opinion this far-reaching revolution was not marked or consolidated by appropriate military reforms. It is not out of place to recall that with the small numerical strength of the Red Army and its weak armaments, during the period of 1924 to 1928 military reforms were made under the direction of the military commission of the Central Committee of the Russian Communist Party (Bolsheviks). The course of military reforms and the five-year plan for building the armed forces were discussed at two plenums of the Central Committee of the Russian Communist Party (Bolsheviks), at the 13th, 14th, and 15th Party Congresses, and at the 3rd and 4th All-Union Congresses of Soviets.

It is quite obvious that at the same high level one should make new and more complex and important military reforms to ensure the decisive reorganization of the armed forces and their readiness to wage nuclear/missile warfare.

We are convinced that military reforms can never be replaced by individual orders, ukases, or measures which make it possible to resolve problems which may be very important but which are still particular problems, expecially if this concerns the creation of new arms of troops. The formation of new types of armed forces and arms of troops must occur on the basis of a law and must be accompanied by a corresponding change in the role and place of old arms of troops, and this is possible only by making thoroughly based and, consequently, firm military reforms.

Military reforms must legalize the formation of new nuclear and missile arms of troops and must simultaneously determine the tasks and role of the old arms of troops.

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

To wage field warfare one must create two new missile arms of troops (nuclear/missile troops and troops for antimissile and antiaircraft combat) and one arm of troops equipped with conventional weapons.

The tasks of the strategic armed forces and the tasks for waging field warfare must also be carefully defined by military reforms. The strategic armed forces are called upon to destroy and neutralize the enemy's military and economic potential and to protect our country.

As is well known, nuclear/missile troops and troops for antimissile and antiaircraft combat (The PVO Troops of the Country) will be organized on a strategic scale. Such a successful combination of new principles of attack and defense on a strategic scale, obviously, can and must be spread to the conduct of field warfare.

In our opinion, military districts, which long ago adapted themselves to waging infantry-tank warfare, also must reorganize themselves in accordance with the new conditions of nuclear/missile warfare. It is obvious that the internal districts must prepare themselves for strategic nuclear/missile strikes and for antiair defense, and the border districts must prepare themselves to wage field warfare with the aim of destroying the armed forces on the fronts.

The combination of strategic nuclear/missile strikes and antimissile operations conducted by internal districts with the nuclear/missile strikes and antimissile operations conducted by border districts will be one of the basic tasks of military strategy.

The complete independence of each district makes for their interchangeability and guarantees the reliability of fulfilment of any strategic and operational task, even when considerable forces are put out of action.

To ensure the complete independence and reliability of operations of each district, during the initial period of a war one must reject the existing methods of rear area support based on supplying the troops with all weapons, including missile weapons, before and during the battle

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

and must change to the principle of early supply of troops with all types of nuclear and missile weapons. Early nuclear/missile supply and engineer preparation of troops in the Theater of Military Operations create genuine conditions for the successful and timely conduct of operations during the initial period of the war.

For the practical instituting of military reforms and transformations in the army one must decisively activate military science. All the problems touching the various areas of reality and practice are resolved now only on a scientific basis. In our opinion, military science is illuminating in a completely unsatisfactory way the path for the practice of military affairs, and to a considerable degree it is still concerned with the scientific basis of problems which have already been resolved. It appears to us that military science concerns itself more with studying the most general laws. It is no accident that a definition of military science is still prevalent according to which Soviet military science is the sole system of knowledge about the preparation and conduct of an armed struggle to defend the Soviet Union from imperialist aggression. In the highest degree this is a general definition. Military science must be the most specific area of knowledge, despite the fact that it relies on the highest and most complex achievements of technology and the intellect.

In our opinion, military science is the science for creating and constantly improving the technical program of armaments, a program which is combined with the most advantageous methods for employing the armed forces and the forms of their organization. The military science of our time fluctuates between the ancient past and the still unknown future. The matter is further complicated because the past stubbornly refuses to relinquish its positions. Under these conditions all our knowledge and experience must be united to work out a new and more intelligent doctrine of field warfare.

If one must put at the basis of this doctrine some expressed views, then it is our deep conviction that they should be the following:

— to save hundreds of billions of rubles by bringing about the best long-range military-technical program based on the recognition of the role of large nuclear bursts and

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

by ceasing the production of unneeded and already quite worthless small nuclear, missile, electronic, and numerous conventional armaments;

— to reduce the armed forces sharply and to receive enormous economic benefits, and at the same time to make them incomparably stronger and more effective in combat;

— to simplify the art of waging armed struggle, to reduce the organs of control sharply, and thus to make it easy to control troops under the most complex field conditions.

Preparation and Conduct of a Front Offensive Operation on a Maritime Axis in the Initial Period of a War

by Colonel-General G. Khetagurov

The theoretical elaboration of the actual problems of preparation and conduct of front offensive operations on a maritime axis is not possible without thorough analysis of the general nature of the initial period of a nuclear/missile war. Without a clear-cut definition of the types of military operations to be conducted on the ground, in the air and on the sea, not taking into consideration the influence of the weapons of mass destruction on the utilization of the types of armed forces in the first days of a war, and many other factors of basic significance, it is impossible to carry out preparation of troops purposefully and understand the situation in which the initial operations of maritime fronts will be conducted.

As concerns the general nature of nuclear/missile war, we agree with the opinion given in the pages of the Collection in the articles of Generals Gorbatov, Gusakovskiy and Babadzhanyan*. The strategic aspect of the initial period of a war will be determined above all by the nuclear/missile strikes delivered by both sides for strategic purposes. The elaboration of the theory and the implementation of such strikes, in practice, are not a function of operational preparation and a mission of the front. However it would be incorrect to be silent about this, because these strikes in particular will set the operational-strategic situation in theaters of military operations, and consequently, will also determine the nature of the tasks facing the maritime fronts.

In the operational-strategic activities of the missile troops, in our opinion, it is essential to differentiate between two types of nuclear/missile strikes: intercontinental delivered by large units of the missile troops of strategic designation, in the interests of the war as a whole, and strikes carried out by the missile troops, long-range missile-carrying aviation, and by the forces of the missile-carrying fleet, bringing in, in some cases, the missile weapons of

* Special Collection of Articles of the Journal "Military Thought", Third Issue 1960 and First Issue 1961./[redacted], [redacted], and [redacted] respectively/. [redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

the fronts to assist in armed combat in a given theater of military operations. Apparently, the latter will be very closely tied in with the utilization of all types of armed forces. In actuality, they will be the basis of a strategic offensive on the TVD (theater of military operations - teatr voennykh deystviy). Therefore, the thorough consideration of all aspects of the concept according to which they are conducted, of their makeup, and of the results expected, will be the foremost condition for the correct and purposeful planning of the front operation on a maritime axis.

It should be assumed that, under the conditions of the Western Theater of Military Operations, the attainment of the basic strategic goals will depend on the destruction of the main missile, ground and air groupings of the enemy in the internal areas of the European continent, where a large part of the most important military-economic and administrative-political centers of NATO are located. However, as experience of many exercises shows, it is only possible to attain these goals by means of simultaneous destruction of the troop groupings operating on maritime axes, most of which lead to important industrial areas. A series of political centers, large cities, centers of communication, military-naval bases and ports, and considerable stocks of materiel means in the areas of the bases, are located on the maritime axes. The most important routes, that connect the armed forces of NATO with their main military-economic base and reserves across the ocean, pass through them.

The significance of maritime axes increases mainly because our probable enemies have a powerful naval fleet, supplied with the latest combat equipment. For this reason it is not accidental that in a TVD the situation will depend, to a large extent, on the degree to which it was possible to disrupt the enemy's plan on the sea and in the coastal zone; to hamper his utilization of missile and air bases located in maritime areas; prevent strikes by carrier large units, missile-carrying vessels and submarines; disrupt naval communication routes and isolate the enemy troops located in the theater from the flow of additional forces and means from other continents.

In the fulfilment of these missions, an important role can be played by front formations operating on maritime axes.

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

In coordination with the missile troops and the means of the fleet they will protect the strategic flank of the armed forces on the scale of the entire theater of military operations, to execute the deep envelopment of the basic groupings of the enemy, disrupting the forming up of his reserves in the maritime areas, and their transfer and forward movement to the main axis. The end result of the offensive operations carried out by the maritime fronts will be that more favorable conditions will be created for the rapid destruction of the most important enemy ground troop groupings and for the establishment of active operations by our fleet on the broad ocean.

The Anglo-American command, not without reason, supposes that the naval fleet, in comparison with the other types of armed forces, will suffer relatively smaller losses during the first days of a war and will retain its capability for immediate operations. This should be remembered constantly.

The NATO command will apparently use the strike forces of the fleet primarily to deliver strikes against groupings of troops and important operational-strategic objectives on the land sectors of the theater of military operations, where the fate of the war will be decided. The force and depth of the fire effect of the fleet in a case of this kind can be very significant. By using carrier strike large units, missile-carrying surface vessels, and submarines, the fleet is able to deliver strikes not only against coastal objectives, but also against those removed hundreds or thousands of kilometers from the coast.

In this respect the NATO exercise carried out in October 1960 was quite characteristic, during which, in the first 27 hours of military operations, 240 nuclear strikes were delivered by the means of one carrier strike large unit, including: 69-according to the plans of the high command, 96-for the counteratomic offensive, 47-to prevent the deployment of ground troops, and 15 strikes to prevent the deployment of naval forces. A total of more than nine-tenths of all the nuclear weapons were used to destroy ground targets removed up to 500 to 600 km from the coast.

Hence it becomes evident that under modern conditions the basis of an enemy nuclear grouping on a maritime axis may consist not only of the missile weapons of the ground

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

troops but basically of the weapons of the fleet. That is why the situation on the sea, to a greater degree than before, will influence the development of front offensive operations, and its influence will spread over a considerable zone, having widened the area boundaries of the maritime axes.

Of course, not all the maritime axes will be equal in importance. Their role will be determined in accordance with operational capacity, the composition of enemy forces, the presence of important operational objectives, and other factors. However, in all conditions, by dint of all the above-mentioned circumstances, in the initial period of a war, an extremely tense struggle will ensue within the borders of the maritime axes in order to fulfil extremely vital and complex operational-strategic missions.

As shown by the experience of exercises, the basic principles of conducting an offensive on an ordinary axis are retained in an offensive operation of a maritime front. However, the special conditions for developing combat operations also present special requirements for conducting operations: the need to take into consideration all aspects of the situation at sea; determining the concept of the operation according to the nature of the adjoining naval theater, the location of naval bases, ports and other coastal installations. The scope of the operation is influenced by the depth of the continental part of the TVD and the balance of the forces in the naval theater.

Under such conditions, first of all, the range of operational missions accomplished by the front troops is widened. In particular, the need arises to seize straits, islands and peninsulas, to organize combat operations with the goal of capturing ports and military-naval bases, to aid the fleet in the destruction of carrier strike large units, and to destroy coastal missile weapons of the enemy. The fulfilment of these missions requires special organization of control, joint utilization of the various types of armed forces, application of distinctive methods of operations of the troops, organization of landing operations, and, mainly — close operational and, to a certain degree, tactical cooperation between the ground troops and the naval fleet.

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

The nature of the cooperation will depend on the general conditions for conducting war at sea. For example, it is known that the decisive role in naval operations is passing to the submarine fleet, to missile-carrying vessels, and to missile-carrying aviation, operating in dispersed formations and delivering strikes from great distances with nuclear/missile warheads and homing (samonavodyashchiysya) torpedoes.

Of course, under such conditions there is no need to "attach" the fleet to the flanks of the ground troops. However it is completely apparent that together with the utilization of its basic forces on the open seas and oceans, on the sea communication routes of the enemy, as before, the direct cooperation of the fleet with the maritime front will have great significance in developing the offensive in the entire depth of the theater. The fleet must reliably cover the maritime flank of the front, to protect it from strikes from the sea, prevent the commitment of additional forces of the enemy fleet through straits into internal bodies of water, ensure the disruption of his sea transport, etc. Undoubtedly, the participation of the forces of the fleet will be essential in the neutralization by fire of enemy installations located on land, moreover, not only in the coastal zone, but also at a considerable distance from the sea.

We are convinced that the reduction of the forces of the fleet, the contraction of its missions, especially in closed seas, may place the maritime front in an extremely difficult position. In such a case, the enemy will derive major advantages. Any possibility of carrying out landing operations or sea transport to assist the front will be almost completely eliminated. The wiping out of enemy groupings pressed up against the sea will be made more difficult. The front must be constantly aware of a possible enemy intrusion from the sea, because it may be obliged to commit considerable forces to cover the maritime flank, and to organize along the coast a powerful system of antilanding and antiair defense, radio countermeasures, and intelligence, which will undoubtedly influence the tempo of development of the operation into the depth.

Therefore, in our opinion, the fleet of a closed sea, even in modern times, must be strong enough. Its qualitative composition is another matter. We do not

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

attempt to make any recommendations on this score, but consider that the conclusions made on this subject in the article of Admiral V. Kasatonov deserve serious attention.*

The mission of securing the maritime flank will have to be fulfilled by means of a broad maneuver of nuclear/missile strikes in combination with the swift movement of troops by air and the creation of operational barriers (including the placement of nuclear mines) on the threatened axes. The pivotal element of the system of cover of a maritime flank, obviously, must be the mobile coastal missile units of the fleet, armed with short-range cruise missile systems and reinforced as necessary by motorized rifle subunits, as well as by air obstacle detachments (vozdushnyy otryad zagrazhdeniya) and separate antiaircraft missile (ZURS) units.

The most important condition for ensuring the stability of the maritime flank is maximum exertion in combat not only with the ground enemy, but also with the sea enemy, striving to inflict destruction on the carrier strike large units before they reach the line of launch of the carrier aviation, and also the disruption of landing operations being prepared, at the moment the landing force embarks on the ships or during their sea passage.

The framework of the operation and the actions of the front troops will be greatly influenced not only by the open maritime flank but by the shore line, the location of inlets, islands, and the nature of the operational objectives located in the coastal zone. In many cases these factors may greatly influence the choice of the form of operational maneuver, the utilization of nuclear/missile weapons, and the assigning of missions to the troops with the purpose of splitting up and liquidating enemy groupings pressed up against the sea.

Inasmuch as the ultimate goal of the front operation, in most cases, will be related to the completion of the

*Special Collection of Articles of the Journal "Military Thought", Second Issue, 1960 [redacted] 1.3(a)(4)

[redacted]

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

destruction of the maritime groupings of the enemy, the capture of harbor areas, supply bases, and the movement of troops to the coast, it is expedient to plan and conduct an offensive on a maritime axis in the entire depth of the theater of military operations — under the conditions of the Western TVD, to 1000 to 1200 km. Here it is extremely important, utilizing the results of strategic nuclear/missile strikes, to reach the Atlantic coast on the 9th or 10th day of the war, i.e., before the main reserves of the enemy begin to arrive from the American continent.

The arrival of strike groupings on the coast during this time period will be realistic with adequate effectiveness of massed strategic nuclear strikes against the enemy; the preservation of the forces of the front and their immediate transition to vigorous operations from the very beginning of the war, that deny the enemy access to our territory; the serious weakening of the enemy fleet, after which it will not be able to give effective support to its troops on the continent and the latter will not be reinforced at this time from bases across the ocean.

On a maritime axis the missile weapons, ground troops, aviation, and naval fleet can be utilized in various ways. However, in all cases, it is extremely important to prevent the enemy from deploying forces on the ground and at sea, and to start vigorous offensive operations as soon as possible. As experience of exercises shows, the maritime front is extremely interested in having the forces and weapons of the fleet that are cooperating with it used vigorously, offensively, and that successive strikes be delivered against the enemy at sea and at bases.

On the whole, joint operations of a front and a fleet must, in our opinion, be examined as a single operation conducted under a joint command with the purpose of simultaneously destroying the enemy on the ground axes and in the adjoining areas of the naval theater. Moreover, it is expedient to have the fleet of a closed sea, before it captures the straits area and exits its main forces into the ocean, under the direct operational subordination of the front. In the future, most often it will be utilized independently, but in this case it is essential that the commander of the front be able to assign missions to the fleet for supporting the offensive and to coordinate the

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

operations of the forces on the ground and at sea.

The unified plan of the offensive operation, conducted jointly with the fleet, must determine the methods for destroying missile, ground, and air groupings and groupings of the naval forces of the enemy. In accordance with the plan, the system of the front operation provides for the delivery of a series of successive joint massed nuclear/missile strikes by the means of the front and fleet; the conduct of a swift offensive by small operational groupings of the ground troops on isolated axes toward vitally important areas and installations of operational significance on the coast; the systematic landing of tactical air and combined amphibious landings; fire support for the ground troop offensive by the weapons of missile units, aviation, and the fleet; the organization of combat with the naval forces of the enemy that are harassing the front troops; screening the maritime flank and the naval communication routes, and finally, the disruption of enemy sea transport.

Joint, massed nuclear/missile strikes are planned jointly by the commanders and staffs of the front and the fleet. As a rule, it is advisable to conduct a large part of the strikes on behalf of the front from the calculation of the use of their results by the ground troops. Moreover, the means of the fleet can be brought in to destroy the most important coastal installations, airfields, and maritime groupings of the enemy. However, sometimes the situation will require the organization of joint mass nuclear/missile strikes on behalf of the fleet. In such a case, the aviation and missile weapons of the front will be utilized, for example, for the annihilation of enemy naval bases, for destroying his coastal defense units, for supporting the penetration of missile-carrying aviation of the fleet, and for facilitating the creation of a favorable situation at sea.

The basis of ground troop operations is made up of swift, deep strikes on separate axes with the simultaneous delivery of enveloping strikes from areas distant from the sea against important maritime objectives. It is possible to create 3 to 5 independent tank strike groupings in the front, consisting of 2 or 3 divisions each, and also a grouping of forces for utilization as a combined amphibious landing. In a number of cases, one of these groupings will advance right along the coast. The main forces, because

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

of the indentations in the coastline and the difficulty of forcing numerous rivers in the estuary sectors. will, as a rule, operate at a certain distance from the sea. The maneuver to the sea is possible with limited forces, because the action of the troops in a solid front along the entire coast is not expedient at the present time. In the coastal zone it is only necessary to capture the most important areas (ports, supply bases, and main road junctions), first breaking up the enemy groupings covering them, pressing them up against the sea and destroying them piecemeal. The basic objectives in the other areas should be suppressed or destroyed by nuclear/missile strikes, creating zones with high radioactive contamination.

It is expedient to combine systematically the envelopment of enemy maritime groupings from the ground with the sudden landing, on the flank and in the rear of the enemy, of combined (naval, air, and tank) landing forces. Some consider that in a modern war amphibious landing forces, because of their great vulnerability, lose their significance. But this conclusion is correct only if it is based on the old principles of organizing amphibious landing operations. Obviously, the dispersed formation of the landing detachments during the sea passage, and the higher tempo of the landing, will make their viability no lower than the viability of regular troop groupings.

It should not be forgotten that the utilization of nuclear weapons will greatly facilitate the overcoming of the antilanding defense and will permit landings with limited forces and in a short time, to fulfil missions to a great depth and with decisive goals. Therefore, we propose that combined landings (if the fleet gets the fast landing craft for their landing) can and must be used widely in the initial operations of a future war. They will permit the holding down of enemy reserves on a broad front, will make it difficult to utilize missile weapons deployed in the maritime areas, will permit more rapid transfer of ground troop efforts into the depth and will eliminate the need to pull in forces of the front from the main axes to capture coastal objectives.

In planning a front offensive operation being conducted on a maritime axis, special attention should be given to

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

the correct assignment of the missions. The recommendations of the existing Field Service Regulations (Corps-Division) concerning this, in our opinion, are outdated. In keeping with the requirement of the Minister of Defense to carry out an offensive with an average speed of up to 100 km per 24-hour period, the depth of the tasks of the formations and large units, in comparison with the norms given in the Regulations, should be sharply increased. In our opinion, it is expedient to coordinate the immediate tasks of the troops with the range of fire of the missile weapons which are correspondingly available to the division, army and front. For example, for the tank division the immediate task can now be assigned for a depth of 25 to 30 km, the follow-up task for 50 to 60 km, and the task of the day for 100 km or more. A combined-arms (tank) army, conducting an offensive on a maritime axis, usually will get an immediate task to a depth of up to 200 to 250 km, and its fulfilment is calculated to take 2 to 3 calendar days. Tasks for groupings conducting an offensive along the coast should be assigned, and the method of operation should be pointed out, in the greatest detail, especially if they have to capture a strait zone in order to achieve maximum coordination of their efforts with the utilization of the forces and means of the naval fleet.

The great depth of the tasks and the necessity of continuous development of the offensive of the maritime fleet require constant concern regarding the preservation of the combat effectiveness of the strike groupings of the troops.

At the moment it is hard to count on the ability of the motorized rifle division to conduct continuous combat operations for more than two, and a tank division for more than three to four, calendar days. Under such conditions great skill is necessary to prevent the premature weakening of troop efforts. The commanders of the front and the armies must take the most energetic steps for the constant maintenance of the most important strike groupings at the minimum necessary combat strength. This pertains especially to the troops operating apart from the main forces, on islands, or those being used for amphibious landings. The maintenance of their combat effectiveness, obviously may be attained not only by committing to combat the reserves coming up from the zone of interior, but first of all by having friendly large units that have lost their combat

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

effectiveness, put back into service quickly. For this the time limits for bringing a division to full strength must be drastically reduced: for a motorized rifle division, up to three, and for a tank division, up to four, calendar days.

The restoration of troop combat effectiveness must be executed according to the unified plan of the front in accordance with the actual concept of the operation. Moreover, in some cases it is expedient to give the salvaged materiel and personnel of the large units taken out of combat to the other troops in the first echelon, and to utilize the staffs that have been relieved thereby as reserve organs of control temporarily. In other cases, it is possible to create from a division a composite detachment-regiment designated for the continuation of combat actions, and to conduct the remaining units to the rear area to bring them up to strength as fast as possible by centralized maneuver of the stock of rehabilitated vehicles in routine maintenance and the bringing up of personnel brought in by aircraft from the depth of the country.

* * *

The conduct of the first front offensive operation on the maritime axes demands all-round training of troops, great combat efficiency and deep insight in the work of all the organs of control, the ability of the commanders and staffs to resolve complex problems, that constantly arise for the troops, in a short period of time. Exceptional mobility in operations is necessary during the period when the forces are brought to increased combat readiness and at the moment the troops are withdrawn from under a nuclear/missile strike being prepared by the enemy.

In short periods of time the location of the anti-aircraft missile troops, radiotechnical equipment, and missile units of the front and army must be completely changed, aviation has to be dispersed, control points have to be moved, pontoon-bridge cover of the most important crossings must be organized; the dispersal of materiel reserves is carried out, etc. At the same time, in coordination with the fleet, screening measures should be carried out for antiair and antilanding screening of the

[redacted] 1.3(a)(4)

[redacted]

1.3(a)(4)

maritime flank, and also aerial reconnaissance of the enemy should be organized in the direction of the sea. Subsequently, every 10 to 12 hours it is necessary to move not less than half, and after a 24-hour period, all units and fire means, without exception, to new areas, taking into consideration that in the maritime zone the enemy reconnaissance may be most active.

In our opinion, the dispersal of the rear services will present the greatest difficulty because of the lack of time and transport. Therefore, so as not to take on too much work, it is expedient to plan the fulfilment of this task in certain phases: the first - in 2 or 3 hours, the second - in 10 to 15 hours and the third - 1 to 1.5 calendar days. First of all, missile warheads and supplies of aircraft fuel stored in the open at airfields should be dispersed. Then begins the dispersal of the other types of ammunition and fuel, i.e., to unload part of them on the ground and keep the rest in the motor vehicle transport of divisions, armies, districts (groups of forces), on ships at sea and at railroad freight relays (zheleznodorozhnaya "letuchka") at small stations and runs (peregon). It is advisable in the beginning to leave materiel maintained in underground storage areas in place, because its destruction with the first strike is unlikely.

The development of the first front offensive operation on a maritime axis will usually be tied in with the moving out of forces from the depth. As a rule, this process begins with the initiation of military operations and will include the concentration of troops with their being brought out to a line 200 to 300 km from the border and the deployment of troops with the immediate creation of operational groupings. During concentration the large units and units, in most cases, will have to be brought out in extremely dispersed formations, in a broad zone and over a large number of routes, utilizing all types of transport. In the process of deploying, the troops must move out to the axis designated to them mainly under their own power, in a specific grouping and in full readiness to go into battle precipitately. The maximum increase of the speeds of march in order to approach the enemy attains great significance here because this will sharply reduce troop losses.

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted] 1.3(a)(4)

It should be expected that on a maritime axis the enemy, using the capabilities of his fleet, will apply the maximum efforts to disrupt the moving out of our troops. For this purpose, on a number of lines and at large water barriers he can create "nuclear fire barriers", extensive zones of radioactive contamination, and also destroy permanent bridges over rivers such as The Western Bug, Vistula, and Oder.

As shown by the experience of many exercises for the timely creation of strike groupings it is essential that, under such circumstances, the troops moving out from the depth not be dependent on bridge crossings. In tank divisions, to be exact, for each tank regiment it is expedient to have a company of tracked, self-propelled ferries, to switch the motorized infantry to amphibious armored troop carriers; and in the combat-engineer battalion of the division, to have a landing-crossing company instead of one of the combat-engineer companies.

Besides, on the estuary sectors of the most important rivers that intersect the maritime axes, already in peacetime, we must carry out advance preparation of components for the construction of underwater bridge crossings, and mainly, for setting up 3 or 4 underground tunnel crossings for through railroad and motor vehicle traffic. With this purpose in mind, Colonel-General F. Malykhin proposes the construction of duplicate bridges (mosty-dubler) *. However, such bridges are no less vulnerable than the basic crossings, while the destruction of tunnels entails great difficulties.

One of the special features of moving the troops out will be the utilization of sea transport. The use of sea transport may play an important role in closed seas, and also when land communication routes of the maritime front are disrupted. Unfortunately, because of the lack of transport ships and the inability to concentrate them in advance at loading points, the movement of large units of ground and missile troops at full strength by sea is improbable in the first operation. The transport of materiel, combat equipment, and replacements may be carried out on quite large scales.

*Special Collection of Articles of the Journal "Military Thought", Second Issue, 1960.

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

The capture of the straits zone will be a very important mission of a maritime front in the operation of the initial period of a war. This will permit the fleet to exit swiftly into the open sea, to put into effect operations on enemy sea communication routes, and mainly, to assure more effective support of the advancing groupings of the ground troops over the entire depth of the theater.

The capture of the straits zone must be preceded by powerful nuclear/missile suppression of the enemy system of defense in the maritime zone, on islands and peninsulas, and also the weakening of the enemy fleet by strikes against his vessels at bases and on the sea. It is also very important to prevent the planned withdrawal of enemy troops from land axes, for which it is necessary, in the shortest possible time, to break through to the approaches of the straits, at least with separate tank large units.

The basic method for capturing the straits zone will be a determined offensive by the tank grouping of the combined-arms army combined with the landing of joint air and amphibious landings in the areas that ensure control over the straits. It is expedient to carry out the special landing operation taking into account the simultaneous capture of all islands and peninsulas in the zone of the straits. However, with a shortage of forces it is possible to use the method of their subsequent capture.

Experience shows that for the successful execution of a landing operation it is necessary to increase to the maximum the rate of embarkation, of the sea passage, and especially the debarkation, of troops on the shore, ensure effective fire support for the landing troops by the means of the front or army missile units, aviation and vessels of the fleet, and also their constant reinforcement by the forces and weapons subsequently delivered by air or sea.

In our opinion, the basis of a combined landing, when landing at considerable distances, must consist mainly of an amphibious landing, and in closed seas over limited distances (up to 25-30 km)—of a tank landing with individual means of flotation (type PSTU). It is true that at the present time the execution of a tank landing entails great difficulties because amphibious tanks, and even more so

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

T-54 and T-55 tanks, do not have navigational instruments, are not sufficiently seaworthy, and require a considerable amount of time for demagnetization. But these deficiencies can be remedied.

It is expedient to execute tactical and, even more so amphibious landings over a broad front in several (at least 4-5) points at the highest possible speed, avoiding the gradual buildup of forces on the shore. For this, simultaneously with the start of the amphibious landing, it is necessary to disembark a helicopter landing force at a distance of 3 to 5 km, and an airborne landing force 25 to 30 km, from the shore. With the support of the missile units of the front and the fleet, the subunits that have landed must develop the offensive swiftly on the designated axes, or they will be wiped out.

In the course of an offensive operation on a maritime front, the main efforts must be concentrated on the destruction of the means of nuclear attack, and also the ground and air groupings of the enemy, with missile/nuclear and chemical strikes, operations of the aviation, and of missile-carrying vessels. Together with this it is necessary to organize the swift movement of tank troops to the siting areas of enemy missile weapons.

In the initial operation of a maritime front, combat with the groupings of enemy ground forces will most often take the form of large meeting engagements that will arise simultaneously on various axes and at various depths. Success achieved in these engagements must be utilized decisively. Enemy forces that were able to survive must be split up, pressed back to the coast, forced into zones of radioactive contamination and, by blockade from the sea, be destroyed with joint strikes by nuclear weapons, aviation, and the fleet.

For the decisive destruction of enemy maritime groupings, the high tempos of troop offensives will have special significance. In the maritime zone, the achievement of this, in the light of the complexity of the military-geographic conditions, entails great difficulties. But nevertheless, even here, it is completely realistic to bring up the question

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

of speeds of up to 100 km per 24-hour period. This requires a further increase in the effectiveness of nuclear-fire support and the use of more expedient methods of operation of the ground troops, including increasing of the speed of the attack, reducing the time for deploying large units, the decisive utilization of intervals and gaps in the combat formations of the enemy.

It is known that in the past the average speed of a tank attack was approximately 8 to 12 km/hour. This was conditioned by the possibilities of conducting aimed fire from the old type tanks, and also by the need to maintain constant fire coordination between the NPP (close infantry support-neposredstvennaya podderzhka pekhoty) tanks and the infantry following them. At the present time this method of operation becomes unacceptable. The attack should not be carried out on a solid front but on axes, wherein the speed of the attack should attain up to 15 to 18 km/hour, because only in this way is it possible to avoid the destruction of troops at the lines of deployment by nuclear weapons and the fire of guided missiles of the enemy antitank means.

In practice the possibility of conducting an attack at a speed of 15 to 18 km/hour is predetermined by the presence of two-plane stabilizing devices for tank armament and the feasibility of operations of the motorized infantry when precipitately breaking through the hastily assumed defense in armored personnel carriers without dismounting. In any case, as shown by the experience of two divisional exercises with field firing that were conducted by the Northern Group of Forces, it is now possible to ensure fairly high effectiveness of destroying targets when moving. For example, at the autumn divisional tactical exercises of 1960, at an attack speed of up to 18 km/hour the tank battalions, operating in the first echelon, successfully fulfilled all fire tasks, having ensured the destruction of 83 to 92 percent of the gun and 81 to 86 percent of the machine gun targets.

The decisive utilization of gaps and breaches in the combat formations of the enemy may play a big role in increasing the speed of the offensive. However, such a method of operations cannot be stereotyped. The strike groupings or large units that have entered the breach may often find themselves in a "pocket" (v "meshke") and will

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

be subjected to a mass enemy nuclear strike. Therefore, the offensive in the gaps of combat formations should be conducted in more dispersed formations, and mainly - with maximum speed.

The correct organization of fire support, and mainly constant coordination of the missile weapons of the front and fleet at their full range, attain primary significance. In particular, we consider that the fleet, using its high maneuverability, must give effective fire support to the strike groupings of the maritime front, not only the ones advancing along the coast, but also those operating at a distance from the sea. In our opinion, the basis of such support must consist of destroying the missile weapons of the enemy fleet with the forces of the navy, and also to destroy important ground objectives and reserves with nuclear warheads from great distances, in the entire depth of the maritime axes.

The complex nature of modern offensive operations requires fundamental improvement of the entire system of troop control of a maritime front. The principle of simultaneous direction of the combat operations of troops on the ground, in the air, and at sea from great distances, by technical means, electronic-computing and automatic devices, should be incorporated in the basis of control. It is also necessary to increase sharply the operational efficiency of the work of commanders and staffs, and to assure the possibility of their immediate reaction to the slightest changes of the operational and radiation, air, and naval situation.

Unfortunately, the existing system of control, as has been pointed out in print several times, does not fulfil the indicated requirements in many ways. Even before complex automatic systems of control are created, it is necessary to carry out a reorganization of the control points, put in order the collection, processing, and routing of operations and intelligence information at the operational and tactical levels, work out the system of "flash (tranzitnaya) information", create calculating-analytical and computing centers in the staffs, and ensure the quick assignment of tasks, and monitoring of the results of the strikes inflicted.

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

In the light of what has been said, let us examine the proposals given by Major-General M. Ivanov in his article.* The idea of creating centers (command, operations-intelligence, nuclear/missile, and VVS and PVO control), as elements of the command post (KP) and the forward command post (PKP) of the front, was already worked out in the Northern Group of Forces in 1959, and was carried out in practice in three front operational command-staff exercises locally which were described in the Information Bulletin SGV. No. 1 (Northern Group of Forces - Severnaya Gruppa Voysk) in the beginning of 1960. The recommendations of General M. Ivanov resemble this system in form, but in substance distort its meaning and are inapplicable. The proposal "... to unite all the directorates and departments, all the services and staffs of the arms of troops which are concerned with the direction of troops into unified control centers" in practice means the elimination of staffs, which is unrealistic and wrong. No centers can assume the full volume of the functions of staffs, directorates and departments. In our opinion, it is impossible to replace the staffs with any kind of centers, either now or in the future. Centers should be created, not as replacements, but based on the staffs, as their organic elements, as combat teams called in to perform tasks of immediate direction of an engagement and the utilization of the means of the front.

It is also impossible to agree with the proposal to create a main command-planning center where, as General Ivanov maintains, "the entire planning of the operation" must "take place". The operational planning will be carried out, not by the center, but by the staff of the front and all the directorates of the arms of troops. Therefore a command center is necessary, and not a command-planning center, as the working area of the front troop commander for simultaneous unified direction of all means of combat, where, in the decisive moments of the operation, the chiefs of the missile troops and PVO troops, the commander of the air army and a representative of the fleet may be located, connected to their operating apparatus by selector and television communications.

* Special Collection of Articles of the Journal "Military Thought", First Issue, 1961.

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

Finally, it is necessary to note that the centers justify themselves only in the event they are properly equipped. For example, in the command center created in the Northern Group of Forces there are electrified registers (tablo) of the readiness of missile weapons and nuclear warheads, of fighter aviation and antiaircraft means; a signal-code device for transmitting commands, and also a screen of the operational situation and radiation situation - and of the situation at sea, the air and PVO situation and the situation of the control of missile troop fire. In a semiautomatic manner the screen gives the data about the situation of friendly and enemy troops. Moreover these screens are not used for observation, as General M. Ivanov recommends, but for making specific decisions based on them and for giving orders to the troops. The principle of organizing and equipping the command center is shown on the diagram.

One of the most important questions of control is the organization of coordination with the naval fleet. Under the conditions of the Western TVD, this coordination, in our opinion, must be organized mainly on behalf of the troops of the maritime front. Moreover, the joint operations of the fleet and front for the nuclear-fire suppression of the enemy on land and at sea, the conduct of joint, massed nuclear/missile strikes, support of the amphibious landings, and also all questions of intelligence, PVO, radio countermeasures, and operational camouflage must be coordinated with special thoroughness.

A strict method of mutual exchange of operations and intelligence information must be established between the staff of the front and the staff of the fleet. An orderly system for directing operations is also necessary, to ensure the fastest possible resolution of all matters concerning joint operations of the ground troops and the naval fleet during their simultaneous fulfilment of overall operational tasks.

Combat Against Enemy Missile Submarines

by Rear Admiral O. Zhukovskiy

The application of atomic energy to the submarine has decisively changed the character of its activity: the operating range of submarines has grown immeasurably, and their speed, especially their submerged speed, their endurance, and their diving depth, have been increased considerably. The arming of submarines with ballistic missiles (ballisticheskaya raketa) with nuclear warheads makes it possible to use submarines extensively in a nuclear attack, assigning them missions to destroy important operational-strategic objectives in enemy territory from great distances. Thus, atomic missile (atomnaya raketnaya) submarines have acquired independent strategic significance, unlike other arms of forces of the navy.

The military leadership of the United States considers that in the next ten years atomic missile submarines will become one of the decisive means of combat at sea and will replace aircraft carriers as the main striking force of the navy. Therefore, the United States is devoting great attention to the construction of atomic submarines equipped with "Polaris" missiles. To allot the maximum possible amount of money for the construction of atomic submarines, the United States has abandoned the further construction of aircraft carriers for the time being.

In the United States there are now three types of atomic missile submarines in service and under construction: the "GEORGE WASHINGTON", "ETHAN ALLEN", and "LAFAYETTE", which differ somewhat in their performance characteristics (taktiko-tekhnicheskiye dannyye). According to the reference book Jane's Fighting Ships, in 1960-1961 the United States should have five submarines of the "GEORGE WASHINGTON" type, five of the "ETHAN ALLEN" type, and four of the "LAFAYETTE" type. In addition, it is planned to build seven more submarines of the "ETHAN ALLEN" type in the next few years.

In October 1960, there were the following atomic submarines in the US Navy: the missile (raketnaya) submarines "GEORGE WASHINGTON" and "PATRICK HENRY", the torpedo (torpednaya) submarines "NAUTILUS", "SEAWOLF", "SARGO", "SKATE", "SWORDFISH", "SEADRAGON", "SKIPJACK", and "SCORPION", the guided missile (UI

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

submarine "HALIBUT", and the radar picket (RLD) submarine "TRITON". Of the submarines under construction, two should join the fleet at the end of 1960, and the remainder on the following dates:

--the missile submarines "T. ROOSEVELT", "ROBERT LEE", and "ABRAHAM LINCOLN" at the beginning of 1961, the "THOMAS EDISON" in May 1961, and the "J. MARSHALL" in June 1961;

--the torpedo submarines, five in 1961, seven in 1962, and four in 1963.

Data on the Construction of Atomic Submarines in the United States as of October 1960[1]

Type of Atomic Submarines	In Service	Under Construction	Planned for Construction	Total
Missile Submarines	2*	7	12	21
Torpedo Submarines	8	18	4	30
Guided Missile Submarines (PL URS)	1	-	-	1
Radar Picket Submarines (PL radiolokatsionnogo dozora)	1	-	-	1
Total	12	25	16	53

*There are now five atomic missile submarines in service in the US Navy.

Altogether, according to data from the foreign press, by 1970 the shipbuilding program of the United States envisages bringing the number of atomic missile submarines in the navy up to 45, and the number of antisubmarine submarines up to 100.

The main centers for construction of atomic submarines in the United States are:

1. General Dynamics Corporation in Groton, Connecticut.

2. Portsmouth Shipyard in Portsmouth, New Hampshire.

3. Mare Island Shipyard in Vallejo, California.

1. The bulletin "Naval Equipment", No. 4, 1961. [redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

4. The New Shipbuilding Corporation in Pascagoula, Mississippi.

5. Newport News Shipbuilding in Newport News, Virginia.

6. The New York Shipbuilding Corporation in Camden, New York /sic/.

The missile submarines are being built primarily in Groton and Camden. The antisubmarine submarines are being built primarily in Camden, Pascagoula, and Vallejo.

At present, the missile atomic submarines of the US Navy are armed with type A-1 Polaris ballistic missiles with a range of 2000 km and a nuclear warhead with a trotyl equivalent of .6 megatons. Later they are expected to take on board for their armament A-2 and A-3 type Polaris missiles with ranges of 2800 and 3200 km and a warhead with a trotyl equivalent of three megatons.

According to data from the foreign press, experimental launchings of Polaris missiles from a submarine have shown that it is possible to use this weapon at a speed of 2 to 3 knots, from a depth of 30 meters, and with a sea state of not more than six balls, conducting the firing with an interval of 15 minutes between firings. Later on, it is proposed to increase the rate of firing, decreasing the interval between firings to 2 to 3 minutes. The accuracy of firing Polaris missiles from a submarine against ground targets with specified coordinates is sufficiently high. According to preliminary calculations, their average probable deviation from target at maximum range is three miles (5.5 km).

The complex navigation equipment of the submarines allows them to sail submerged for a long time and determine their own position exactly without coming to the surface, and this ensures the launching of the missiles against specified coastal targets.

The systems for biological protection of personnel from radiation, and regeneration and conditioning of the air, which are installed on atomic submarines, and also the quality of the outfitting of the internal quarters, provide the comparatively good habitability of the submarines and

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

the necessary conditions for the crew of a submarine continuously submerged for almost two months.

According to the views of the military leadership of the United States, the use of missile submarines in a surprise nuclear attack should be sufficiently effective. The Pentagon believes that to achieve this effectiveness, up to two thirds of all the missile atomic submarines must be constantly at sea.

At the present time, American atomic missile submarines continuously patrol in the Northeast Atlantic area in readiness to deliver nuclear/missile strikes against previously designated targets in the territory of our country, just as the bombers of the strategic aviation of the United States, with their load of atomic and hydrogen bombs, patrol in the air. Thus, the atomic missile submarine (PLAR) "GEORGE WASHINGTON" arrived in the patrolling area for the first time on 24 November 1960 and returned to New London (in the United States) on 21 January 1961. This submarine carried out patrolling for the second time from 3 March 1961 to 27 April 1961. The atomic missile submarine "PATRICK HENRY" was on patrol from 28 December 1960 to 8 March 1961. The relief of submarines is carried out on station, and this ensures the continuity of the patrolling and the possibility for immediate use of the missiles. As new missile submarines are put in service, the number of patrolling submarines will be increased.

As a result of the ever-increasing importance of atomic missile submarines in the plans of our probable enemy, primarily in a surprise nuclear attack, combat against them must be considered one of the main missions of our navy. This combat must be a combination of offensive and defensive operations carried out in the entire depth of possible location of enemy submarines in a given sea (ocean) theater of military operations.

In our opinion, under modern conditions combat against submarines should envisage the following:

--destruction of the points of basing and construction of missile submarines, and also the destruction of the submarines at these points;

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted]

--the searching out and destruction of missile submarines at the exits from bases, during sea passage, on the approaches to the launch positions, and in the area of launch positions (startovaya pozitsiya);

--frustrating and hampering the missile submarines in the use of their weapons;

--destruction of the forces and means of combat support of the missile submarines.

The experience of the past war testifies to the considerable effectiveness of strikes against the system of construction and basing of submarines. Thus, for example, despite several measures carried out by the German command to defend the points of construction and basing of submarines (construction at the shipyards of special concrete-covered shelters in which were carried out the construction and assembly of submarines, construction of shelters for the basing and repair of operating submarines, strengthening of the antiaircraft defense of the points of construction and basing, etc.), submarine losses sustained by the former German fleet at bases were very substantial. Directly at bases from the strikes of aviation, 63 submarines were lost, 150 submarines were lost in the process of construction -- at assembly yards, at outfitting yards, and in transport-- and 22 submarines were lost during trials and combat training. A total of 235 submarines were destroyed at bases, and in the process of construction and trials; this amounts to 25.2 percent of the total German submarine losses.

In addition, as a result of bomber strikes against German shipbuilding centers and other industrial enterprises cooperating with them, German submarine shipbuilding systematically failed to fulfil submarine construction plans. During the years of the war, this nonfulfilment reached 29.5 percent of the plan and amounted to 462 submarines. (See Causes of German Submarine Losses During Their Stay at Bases and in the Process of Construction and Combat Training, by A. L. Elfshits, published by the Naval Academy of Shipbuilding and Armaments i/n Krylov (VMAKV im. Krylova) in 1960.)

Thus, although the main German submarine losses were sustained during their conduct of combat operations at sea, even during the past war the tendency of a relative decrease

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted]

of submarine losses at sea and a relative increase of submarine losses at construction bases became evident. In a future nuclear/missile war this tendency probably will become more evident. With the appearance of atomic submarines possessing high maneuvering capabilities and great endurance, combat with them at sea has become much more difficult and complicated than in the past. The nature of probable operations of these submarines differs sharply from the nature of operations of submarines in past wars, when they were forced to approach vessels and ships to the range of a torpedo salvo because the basic mission of submarines was to destroy vessels and ships, i.e., the destruction of sea targets. In approaching the targets being attacked, submarines were forced to break through the line of protection, exposed themselves, underwent pursuit, and some of them were destroyed.

As has already been indicated above, atomic missile submarines have as their basic mission the destruction of important coastal targets. Therefore, one can anticipate that while bound for launch positions to fire ballistic missiles they will avoid meeting any vessels so that they will not be detected prematurely. If it is taken into consideration that the launch positions and the routes of movement to them can be situated in vast spaces of ocean in areas where the operations of our antisubmarine forces are hampered, then the advisability of delivering strikes against points of basing and construction of missile submarines, to destroy the latter before they put out to sea, becomes evident.

However, it is necessary to keep in mind that the goals of combat against missile submarines cannot be achieved completely by means of strikes against bases and construction points, because a large portion of the enemy submarines (according to American views, up to two thirds of the effective strength) always will be at sea. Therefore, despite all the complexity of its organization and the large economic expenditures, direct combat against enemy submarines at sea continues to remain one of the main methods of combat against missile submarines, along with their annihilation at bases and the destruction of shipbuilding centers.

The missions of destroying missile submarines at bases and destroying naval bases, shipbuilding, and missile-building

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted]

plants, and also other important industrial enterprises cooperating with these plants, can be assigned to the missile troops. It is obvious that the operations of the missile troops in fulfilling these missions differ in no way in principle from operations to annihilate or destroy other important targets; therefore, they are not being examined in the present article.

With the present state of coastal missile weapons, the destruction of submarines at sea can be carried out only by the navy. Taking into consideration the complexity of combat against submarines at sea, let us examine in more detail the basic principles of the organization and conduct of combat operations to destroy submarines by naval forces.

In view of the fact that it is difficult or even impossible to distinguish missile submarines from submarines of other types at sea, combat against them will develop into combat against all submarines. It must be waged in vast areas of oceans and seas, including even Arctic areas. This combat demands a considerable quantity of forces and vigorous exertion of them. . . . To destroy a missile submarine at sea or bar the use of its missile weapons against important coastal targets, it is necessary to detect the submarine even before the approach to launch positions and to concentrate antisubmarine forces for its pursuit and destruction in the area of detection. Of course, it is difficult to carry out a mission of this sort by haphazard operations of special naval antisubmarine forces without advance equipping of the sea (ocean) theater of military operations with various antisubmarine means.

We believe that combat against submarines at sea can be successful when the use of antisubmarine forces is supported by a previously prepared and continuously operating system of antisubmarine defense in the theater.

A continuously operating system of antisubmarine defense must be a set of measures for the special equipping of the theater and organizing the combat operations of naval forces directed toward combat against enemy submarines, and must include:

--stationary means and maneuvering forces used for antisubmarine observation and for warning about detected enemy submarines;

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

1.3(a)(4) [redacted]

--mine and net barriers, restricting the penetration of submarines into defended areas;

--antisubmarine forces used for seeking and destroying submarines on antisubmarine lines and in open areas of the sea, and also the means to control them.

Taking into consideration the threat of delivery of surprise concentrated strikes by missile submarines of the probable enemy which are continuously at sea, it is advisable to create and use a system of antisubmarine defense, of necessity, even in peacetime, like the system of antiair defense of the country.

In our opinion, the makeup of the system of antisubmarine defense must conform to the following basic principles:

1. Antisubmarine defense in a theater should be created to a depth of not less than the firing range of ballistic missiles from enemy submarines against important operational-strategic objectives on the coast and in the depth of the territory of the country.

There is no doubt that the best system would be one operating within the limits of the entire theater right up to the exits from the points of basing of the enemy submarines. However, actual capabilities are inadequate to create such a complex system of antisubmarine defense (PLO) over the entire expanse of the seas and oceans. Therefore, we speak of a depth of not less than the range of fire of the ballistic missiles as the necessary minimum. On various axes of the theater, it is necessary to determine the depth of the antisubmarine defense on the basis of the military-geographic conditions, the location of objectives being defended, the degree of threat from enemy missile submarines, and the capabilities and performance characteristics (taktiko-tekhnicheskoye svoystvo) of the antisubmarine forces and means.

2. Antisubmarine defense in a theater should be echeloned; this is achieved by the organization on separate axes of a series of successive operations of antisubmarine forces on several lines (in several zones).

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted]

1.3(a)(4)

This principle is necessitated by the impossibility of reliably accomplishing the mission of search and destruction of enemy submarines on one line and is directed toward the achievement of higher probabilities of destruction of enemy submarines.

3. The density of the antisubmarine forces and means comprising the system of antisubmarine defense should correspond to the degree of threat of enemy submarine operations from various axes, and also with the capabilities of antimissile defense on these axes because the security of targets being defended is ensured by the destruction not only of the submarine missile carriers, but also of the missiles themselves.

This principle conforms with the requirement of the optimum of the system of antisubmarine defense, ie., the achievement of its maximum effectiveness, defined as the greatest probability of destruction of enemy submarines and the least damage inflicted on our coastal targets through the efficient disposition of antisubmarine stationary facilities and maneuvering forces in a theater.

4. Antisubmarine defense in a theater should possess high combat stability and constant readiness to repel a surprise attack of enemy submarines.

This is especially important for the initial period of a war, when the enemy will try to use simultaneously all of the strike forces of his fleet which have been deployed at sea beforehand to wage a nuclear attack.

The system of antisubmarine defense should be tied in with the reconnaissance and the patrol service and with the organization of observation in the theater as a whole, and also with the antiaircraft (antimissile) defense of the country.

Such are the basic principles for building a system of antisubmarine defense in a theater, and the observance of them, in our opinion, will ensure the success of operations of the naval forces for the destruction of enemy missile submarines at sea.

Who should exercise control over the system of antisubmarine defense in a theater?

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

There can be only one answer to that question -- the commander of a fleet, for only he has sufficient means available and is capable of resolving the entire group of problems connected with waging combat against submarines within the limits of a theater as a whole.

In accordance with possibilities for using various types of weapons by enemy submarines and the performance characteristics of antisubmarine forces and means, the search for and destruction of submarines at sea is organized into near and far zones of antisubmarine defense.

It is accepted practice to consider that the near zone of the antisubmarine defense will be established in the coastal part of a sea. The basic mission of antisubmarine forces operating in the near zone is to defend its lines of communications, vessels and ships at bases and points of dispersal, and coastal installations against action by enemy submarines.

The search for and destruction of submarines in the near zone is carried out by antisubmarine surface vessels, aircraft, and helicopters. Fixed antisubmarine means are also widely used for combating submarines in the near zone.

The far zone of the antisubmarine defense includes the water space from the outer limit of the near zone of the antisubmarine defense to the maximum possible distance away of the launching line for ballistic missiles from enemy submarines against the most important targets on the coast and in the depth of the territory of the country. The basic mission of the antisubmarine forces operating in the far zone of the antisubmarine defense is to bar strikes by enemy missile submarines against coastal installations.

The search for and destruction of missile submarines in the far zone of the antisubmarine defense is carried out by antisubmarine submarines, aircraft, helicopters, and surface vessels.

Antisubmarine submarines possess a number of positive characteristics: a considerable operating radius, great endurance, and the capability to operate under ice cover.

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

The antisubmarine submarines have means to detect enemy submarines and antisubmarine weapons to destroy them.

Such characteristics of atomic antisubmarine submarines as range of operation, endurance, and the capability of sailing under ice are practically unlimited and will depend mainly on the physical condition and morale of the crew and also on the presence of equipment for regeneration of the air. The range of operation and endurance of diesel-electric submarines are determined by fuel supplies, and their endurance and range of sailing under ice are determined by the capacity of their storage batteries.

The possibility of antisubmarine submarines' choosing sailing depth and low-noise speeds in a favorable hydrologic relationship contributes to more effective use of the hydroacoustic equipment for observation through the water medium and detection of submarines.

Surface antisubmarine vessels also have a number of favorable characteristics enabling them to wage combat against submarines both in near and far zones of the antisubmarine defense. Among such characteristics are the following:

--large sailing ranges and endurance;

--the capability of carrying out the search and pursuit of submarines under difficult hydrometeorological conditions;

--the availability of powerful antisubmarine weapons which, because of their weights and sizes, cannot be used by other arms of the forces;

--the opportunity to establish well-equipped command posts making it possible to control the heterogeneous antisubmarine forces directly at sea.

However, the combat use of antisubmarine surface vessels is hampered by a number of shortcomings. These shortcomings are: first of all, low combat capabilities to repel air attacks, and this makes it necessary to protect in a special way their stay at sea; less range of hydroacoustic detection in comparison with the hydroacoustic sets of submarines, and this reduces the effectiveness of

[redacted] 1.3(a)(4)

[redacted]

1.3(a)(4)

their search for submarines; and little concealment of the operations of antisubmarine surface vessels from enemy reconnaissance, and this facilitates the selection of axes of movement for submarines' breaking through.

Antisubmarine aviation, having available modern airplanes and helicopters of long and short range magnetometric and radio hydroacoustic means of observation through the water medium, and with special types of antisubmarine weapons is capable of waging effective combat against submarines at sea.

The favorable characteristics of antisubmarine aviation are:

--the capability of searching, in short periods of time, large spaces of the sea to the entire extent of possible use of missiles from submarines by the enemy;

--high readiness for operations and the capability of arriving in areas where submarines might be located in the shortest time;

--the potential for quickly concentrating the necessary number of airplanes and helicopters on the required axis of operations.

The shortcomings of antisubmarine aviation, hampering its combat use, include the following:

--dependence on meteorological conditions and the status of airfield basing;

--the relatively low endurance of airplanes (helicopters);

--limited potential for carrying out combat operations in Arctic areas.

Planning the operations of the forces of a fleet to destroy enemy submarines at sea is done by the staff of the fleet, taking into account the combat capabilities of the enemy submarines and its own forces, their operational and tactical characteristics, and also the possibilities of supporting combat operations, and the military-geographic conditions of the theater.

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted]

It is advisable to carry out combat operations to destroy enemy submarines at sea, particularly in the initial period of war, by enlisting the maximum possible quantity of antisubmarine forces and facilities of the fleet and also the ships and aviation of the maritime fleet, the fishing industry, and the Chief Directorate of the Northern Sea Route, which are capable of carrying out observation of enemy submarines. In the period preceding the initiation of combat operations, all of the forces mentioned should be deployed in the zone covered by the system of antisubmarine defense in the theater, beyond the limits of this zone on the approaches to the points of basing of the submarines of the probable enemy, and on the routes of their movement into areas of combat operations.

The great difficulty of operations of antisubmarine forces in a theater during a period of threat is that, not having the right to use their weapons, they are, in point of fact, deprived of the opportunity to prevent actively the deployment of missile submarines of the probable enemy to launch positions or, in general, to any areas of sea located beyond the limits of our territorial waters.

In our opinion, under these conditions the use of antisubmarine forces should be organized in the following manner: Before the signal of the beginning of military operations, antisubmarine forces operating beyond the limits of territorial waters establish observation of every detected submarine, information about which is transmitted from some groupings of forces, individual vessels (ships), and means of observation to others located on the path of the submarine's movement. Such escorting of detected submarines must be done without the use of weapons until the signal of the start of military operations or until the moment of use of weapons by enemy submarines against our antisubmarine forces. Upon receipt of the signal for the start of military operations, attacks against all detected submarines are carried out by those forces in whose area of operations they are located.

With the start of military operations it is advisable to carry out immediately the establishment of antisubmarine barriers in previously planned areas in which they could not

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

be established earlier because of peacetime conditions.

In our opinion, the sequence of operations of the antisubmarine forces to destroy submarines at sea is determined by the operational organization of the antisubmarine forces resulting from the decision of the commander of the fleet and depends on what area the initial detection of an enemy submarine is made in and what forces or means it is made by. By areas, the sequence of operations might be approximately the following:

Beyond the limits of the zones covered by an antisubmarine defense system, destruction of enemy submarines at sea must be carried out by our submarines deployed on approaches to the bases of enemy submarines, in remote areas of the sea, at exits from straits, and also on probable routes of movement of enemy submarines to launch positions.

Prior to the approach of enemy submarines to the antisubmarine lines and lines of observation, action against them can be carried out by our submarines deployed to fulfil other missions (operations against aircraft carrier strike forces and on the lines of communications) in areas through which pass the routes of movement of enemy submarines. In the operations of our antisubmarine forces in the Arctic, a systematic search for and destruction of enemy submarines must be carried out by atomic submarines under the ice and by antisubmarine aviation in open water areas in the ice (ledovoye razvodye) and in the open water areas beyond the landfast ice (zapripaynaya polynya).

With the approach of enemy submarines to the antisubmarine lines[1] antisubmarine submarines are moved to the sector of probable courses in accordance with information from reconnaissance and stationary means of observation. The antisubmarine submarines attack the enemy submarines in sequence and direct antisubmarine aviation and surface vessels against those submarines which have broken through into the depth of our defense. Aviation and antisubmarine surface vessels in tactical coordination carry out the search for and destruction of enemy submarines which have broken through within the limits of the areas assigned to them.

With the discovery of the axes of operations of the enemy submarines, a redeployment of forces ensuring a

1. The term antisubmarine line (protivolodochnyy rubezh) means an echeloned barrier of various fixed means and maneuvering antisubmarine forces, in relatively narrow axes of sea on probable routes of movement of enemy submarines.

[redacted] 1.3(a)(4)

strengthening of efforts on the main axes should be carried out in the system of antisubmarine defense of the theater. In addition, in the areas of probable launch positions it is necessary to carry out systematically a search for enemy submarines which have broken through, with the goal of destroying them and hampering the use of their missiles.

The most crucial and difficult measure in combating submarines at sea is searching for them. There are various methods of operations of forces of a fleet in searching for enemy submarines. Specific selection of methods should be determined with consideration of the operational-combat capabilities of one's own forces and the enemy, the military-geographic features of the area of combat operations, its provision with antisubmarine barriers and stationary and drifting means of antisubmarine observation, and also the importance of the area in the over-all system of combating submarines in the theater.

In carrying out the search for and delivery of strikes against enemy submarines at sea, antisubmarine submarines can use the following methods;

--the position (pozitsionnyy) method (when carrying out independent operations on routes of passage of submarines through straits and narrows);

--the position-maneuvering (pozitsionno-manevrennyy) method (when carrying out operations jointly with other forces and when operating on the basis of data on initial detection of enemy submarines from stationary means of observation);

--and the cruising (kreyserstvo) method (when carrying out independent operations in areas of possible positions, in a zone of pack ice, and on approaches to points where enemy missile submarines are based).

Antisubmarine submarines on position search the areas assigned to them, running at low-noise speeds at depths providing the greatest operating range for their hydroacoustic means of observation.

After detection of enemy submarines, antisubmarine

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

submarines determine the elements of the enemy movement and maneuver to take favorable fire positions with speeds and depths ensuring advantage in the operating range of their hydroacoustic equipment. After the attack, depending on the results of the attack, the antisubmarine submarines either occupy positions for a repeated attack or continue searching. Later, at the first opportunity, these submarines report on the attack, its results, and the further movement of the enemy.

The basic method of operations of antisubmarine aviation for the destruction of enemy submarines is active search by groups of antisubmarine airplanes, either independently or on the basis of information of initial detection of submarines by other arms of forces or from stationary means of observation.

Operating independently in assigned areas or on lines, hunter-killer groups of antisubmarine aviation carry out the following:

--the laying of barriers of moored radio hydroacoustic buoys (radiogidroakusticheskiy yakornyy buy), set out in lines perpendicular to the probable axis of movement of enemy submarines;

--the laying in open areas of the sea of drifting radio hydroacoustic buoys (radiogidroakusticheskiy dreyfuyushchiy buy) in the form of a zone of dense coverage (several parallel lines, in a circle or in a spiral), with the calculation of obtaining contact with a submarine at any point in the area of its assumed location;

--the laying of drifting radio hydroacoustic buoys in lines covering an area subject to search, with simultaneous search in the area with the aid of hydroacoustic sets lowered into the water by helicopters or of aerial magnetometric equipment (aeromagnetometricheskaya apparatura).

In accomplishing the mission of search and destruction of submarines on the basis of data of initial detection by other forces, it is most advisable to lay intersecting barriers of several parallel lines of drifting radio hydroacoustic buoys in the sector of possible courses of submarines detected earlier.

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted]

To reduce enemy counteraction against antisubmarine aviation, it is essential to choose, when possible, areas of its operation and flight routes to these areas which are outside the zone of operation of enemy fighter aviation. After detecting enemy submarines, aviation hunter-killer groups attack them, using antisubmarine aerial bombs with a special charge or antisubmarine aerial torpedos to destroy the submarines. Airplanes which have not discharged their weapon loads or antisubmarine surface vessels located in the waiting areas are directed against the undestroyed submarines.

The basic method of operations of antisubmarine surface vessels is carrying out the search for and destruction of submarines as components of vessel hunter-killer groups. Taking into account the high maneuvering capabilities of missile submarines and their advantages over surface vessels in range of detection by hydroacoustic means of observation, surface vessels should be used for searching for submarines jointly with airplanes of the antisubmarine aviation and helicopters which are components of hunter-killer groups and also independently on the basis of data of initial detection of submarines by other arms of forces or by the stationary means of antisubmarine observation. After detecting enemy submarines, the vessel hunter-killer groups carry out a number of successive attacks against the detected submarines, using rocket (reaktivnyy) depth charges, ordinary depth charges, and antisubmarine torpedoes.

The basic principle of the use of antisubmarine forces to destroy enemy submarines at sea is their joint operations, which make it possible to carry out combat missions more effectively. Joint operations can be carried out by groupings of antisubmarine forces with the following possible combinations of heterogeneous forces of the fleet:

--antisubmarine submarines and airplanes (helicopters);

--antisubmarine airplanes (helicopters) and surface vessels;

--antisubmarine submarines and surface vessels;

--antisubmarine submarines, airplanes (helicopters), and surface vessels.

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted]

Coordination between antisubmarine submarines and antisubmarine aviation and also between antisubmarine submarines and surface vessels consists of agreement upon time and location of search for enemy submarines carried out by these forces independently within the limits of assigned lines (areas). Coordination is achieved through direction, by the combat fleet command post (BFKP) of the commander of the fleet, of antisubmarine aviation or surface vessels against enemy submarines detected and not destroyed by our antisubmarine submarines and through the designation of demarcation zones between areas of operations of various forces.

Coordination between antisubmarine aviation and surface vessels consists of agreement upon time and place of search efforts and attacks against enemy submarines carried out by vessels and airplanes (helicopters) independently or jointly. Coordination is achieved through direct mutual direction of vessels and airplanes and determination of the sequence of attack during joint operations or through direction of hunter-killer groups against enemy submarines by the combat fleet command post of the commander of the fleet during independent operations. Direction of vessels against detected submarines by airplanes can be carried out by radio information (radioinformatsiya) methods, radio homing (radioprivod), leading (lidirovaniye), and with the aid of visual signals. Direction of airplanes against detected submarines by vessels is carried out by issuing information on their own location and the bearing and range of the submarine.

Combat against enemy missile submarines does not amount only to operations for the direct destruction of the submarines themselves, the carriers of missile weapons. It is also necessary to strive for the creation of conditions which hamper the control of the submarines and their use of their weapons. This can be achieved by the following:

--destroying the coastal control points of the submarines, the transmitting and receiving radio centers with the goal of making it difficult for the enemy to control his submarines at sea;

--destroying or putting out of operation coastal systems of radio navigation and destroying satellite (sputnikovyy)

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

systems of navigation to make it difficult for enemy submarines to determine their position at sea and thus reduce the accuracy of their firing of ballistic missiles;

--radiocountermeasures (radioprotivodeystviye) against systems of control of missile weapons, radio navigation systems, and communications installations.

Preparing for an aggressive war against the USSR and the countries of the Socialist Camp, the military leadership of the United States began to devote great attention to the Arctic as a possible base of operations for a surprise nuclear attack. With this goal, the intensive study and mastery of the Arctic, primarily by atomic submarines, began. Thus, since October 1957, American atomic submarines have carried out a total of seven voyages, passing under the ice of the Central Arctic Basin by various routes. Considering the threat of the use of missile submarines from this axis, it is advisable to provide for the establishment of an anti-submarine defense in the Arctic areas.

Considerable influence on the organization of anti-submarine defense in the Arctic is exerted by its physical and geographic features. Bad meteorological conditions during the larger part of the year and ice cover hamper the use of antisubmarine forces, particularly aviation and surface vessels. Frequent magnetic and ionospheric disturbances complicate the organization of continuous 24-hour communications with antisubmarine forces. The presence of great depths, drifting icebergs, and the forward and rotating movement of icefields hinder the establishment of stationary systems of observation of submarines.

In addition to the measures enumerated earlier, the success of operations of the forces of the fleet for the destruction of enemy submarines in Arctic waters should be ensured by the following:

--use of antisubmarine submarines to search for and destroy enemy submarines under the ice;

--use of antisubmarine aviation to search for and destroy enemy submarines in open water areas in the ice and in the open water areas beyond landfast ice in areas of probable launch positions;

--establishment of antisubmarine barriers in straits and narrows on possible routes of penetration of submarines

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted] 1.3(a)(4)

into Arctic areas to launch positions;

--wide use for antisubmarine observation of ice hydroacoustic stations in a zone of pack ice, and cable-connected hydrophone lines (kabelno-gidrofonnaya liniya), coastal hydrophone stations (beregovaya shumopelengatornaya stantsiya), and stationary radio hydroacoustic buoys near the ice edge, together with the antisubmarine forces permanently located in these areas;

--continuous ice, hydrometeorological, and geophysical reconnaissance, making it possible to predict ice movement, hydrological characteristics, and the transmission of radio waves of various length, and in accordance with this to correct the system of antisubmarine observation, redistribute antisubmarine forces by areas, and ensure uninterrupted communications with them by the proper selection of frequencies;

--the establishment of far forward ice airfields and points of material-technical support, making it possible to carry out a broad maneuver by antisubmarine aviation in ice areas in accordance with the mobility of the ice and the presence of open water areas in the ice and open water areas beyond the landfast ice;

--the establishment on the Arctic islands of remote control posts (vynosnyy post upravleniya) for the antisubmarine forces and repeater centers of communications (repetichnyy uzel svyazi), ensuring the possibility of controlling forces directly in areas of combat operations.

As is generally known, since November 1960 one or two American missile submarines constantly patrol in the area of the Lofoten Islands near the coast of Norway. It should be expected that they can take up launch positions among the Norwegian fiords. Therefore, it is necessary to devote attention to the organization of combat against missile submarines with launch positions in fiord areas of the enemy seacoast. The location of these areas outside the limits of our antisubmarine observation, in a zone of powerful enemy antiaircraft and antisubmarine defense, and also the difficult navigational and hydrographic conditions for sailing, hamper the use of our antisubmarine forces directly among the fiords.

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted]

To hinder or eliminate the operations of missile submarines in fiord areas, there can be carried out systematically the concentrated laying of antisubmarine mines, the destruction of the system of channels among the fiords, and the search for and destruction of enemy missile submarines at entrances to fiord areas and in open reaches. The success of combating missile submarines in a fiord area depends to a great extent on the organization of agent intelligence (agenturnaya razvedka) and radio intelligence (radiorazvedka), which in this case partially perform the functions of antisubmarine observation.

Summing up this brief examination of the basic problems of organizing and waging combat against enemy missile submarines, it is possible to draw the following conclusions:

1. Combat against enemy missile submarines is an intricate complex of combat operations and measures carried out not only by the navy but also by the armed forces of the country as a whole.

2. Successful combat against missile submarines at sea requires the creation of special highly effective antisubmarine forces and means and the use of them in a quantity which ensures high probabilities of destruction of enemy submarines.

3. Despite the over-all complexity of combat against enemy missile submarines at sea, it can be sufficiently successful if there are the following: a system of anti-submarine defense previously deployed during peacetime, high combat readiness of antisubmarine forces, and mobile use of them during combat operations.

Following is a verbatim translation of an article entitled "Some Problems in Destroying Targets with Nuclear Warheads", by Chief Marshal of Artillery S. Varentsov.

This article appeared in the 1961 Fourth Issue of a special version of the Soviet military journal Voyennaya Mysl (Military Thought). This journal is published irregularly and is classified TOP SECRET by the Soviets. The 1961 Fourth Issue went to press on 20 October 1961.

Headquarters Comment: "Military Thought" is published by the USSR Ministry of Defense in three versions, classified RESTRICTED, SECRET, and TOP SECRET. The RESTRICTED version is issued monthly and has existed since 1937. The SECRET version is issued irregularly. By the end of 1961, 61 issues had been published, 6 of them during 1961. The TOP SECRET version was initiated in early 1960 and is also issued irregularly.

Some Problems in Destroying Targets with Nuclear Warheads

by Chief Marshal of Artillery S. Varentsov

As is known, the use of nuclear weapons is making fundamental changes in the quality of fire and is increasing immeasurably the force of fire strikes against the enemy. The effectiveness of the destructive power of nuclear weapons can be judged by the fact that it is sufficient to deliver only two or three nuclear strikes with a yield of 300 kt each to destroy an infantry or armored division located in the concentration area.

The destructive effect of a nuclear weapon is greatly increased through the use of surface nuclear bursts, which result in an additional destruction of enemy personnel by strong radioactive contamination of the terrain following the drift of the cloud formed by the burst. Thus, with a surface nuclear burst with a yield of 300 kt and with a wind speed of 20 kph, the burst itself will destroy unprotected personnel in an area of 30 km^2. Because of the radioactive contamination of the terrain, however, one hour after the burst the unprotected personnel in an area of 80 km^2 will receive a dose of radiation of 200 roentgens. Thus, the total area of destruction increases from 30 to 110 km^2.

The significant radioactive contamination of terrain created by surface bursts and by a wind favorable to us permits a paralysis of enemy maneuver over a large area. But, if careful consideration is not given to the force and direction of the wind, then one can contaminate one's own troops or lower their maneuverability with one's own nuclear strikes. This consideration must be kept in mind when planning surface nuclear strikes.

The use of missiles as delivery vehicles for nuclear charges has increased immeasurably the depth of the effect of fire on the enemy. There cannot be a single enemy objective which can remain inaccessible to our nuclear strikes.

The great range of fire of missiles makes it possible to resolve the problem of fire maneuverability in a new

[redacted] 1.3(a)(4)

[redacted]

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

IRONBARK

1.3(a)(4)

and more successful way than formerly while conducting an operation. It is now possible to maneuver fire on a sufficiently broad scale and, thereby, quite effectively and quickly influence the course and outcome of combat operations. By using missile units and large units of front and army subordination to carry it out, maneuver by fire is possible along the entire offensive zone of a front and an army. Furthermore, missile large units and units may be used successfully to carry out missile/nuclear strikes not only in their zone but also in the zones of adjacent armies.

All the above-mentioned qualities of missile/nuclear weapons allow them to be used for primary missions of destroying the enemy and, first of all, for missions of destroying the enemy's means of nuclear attack, his aircraft on his airfields, his missile and nuclear warhead depots, his control points, his first echelon troops and his operational reserves in concentration areas, and in unloading and other areas, as well as his most important objectives of the rear.

If a count is made of the number of objectives in the offensive zone of a front, the destruction of which can be assigned to nuclear weapons, it would reveal that they greatly exceed the possible allotment of nuclear warheads for the operation. Table 1 shows the most typical objectives of an enemy field army, the destruction of which objectives can be assigned to nuclear arms.

In order to insure success in an offensive operation, when only a limited amount of nuclear warheads is available, it is necessary to exercise great care in selecting the objectives to be destroyed by nuclear weapons. They must truly be the most important objectives, the destruction of which will result in achieving fire superiority over the enemy, a sharp change in the relative strength of forces in our favor, the loss of control by the enemy, and, as a result, the creation of most favorable conditions for operations by tank, motorized infantry and airborne large units and units in completing the total rout of the enemy. The first to be destroyed are the enemy's means of nuclear attack, his main grouping, including those troops occupying defensive positions in the tactical zone, his most important operational reserves, and his large control points.

IRONBARK

[redacted] 1.3(a)(

The experience of command-staff exercises and of exercises with troops shows that the staffs, when planning missile/nuclear strikes, often fail to take into consideration the nature of targets and the fire capabilities of missile units and large units. The yields of nuclear charges needed for the destruction of specific targets are estimated by eye (na glazok), without taking into account the actual characteristics of the missiles or the nature of the targets. Estimates of the expected result from each missile/nuclear strike and of the possible enemy losses suffered from a massed strike are not made. All this produces a wasteful expenditure of powerful means of destruction and, as a result, considerably reduces the fire effect upon the enemy.

When planning missile/nuclear strikes, the combined-arms staffs and the staffs of missile troops and artillery of a front or army and, in a number of cases, of a corps and division, besides selecting objectives for destruction, designating a missile unit or large unit to carry out each fire mission, and resolving many other problems, also have to select the yield of a nuclear charge needed for the destruction of each target and estimate the expected result of fire against each target by charges of a given yield.

The destruction of each of the targets shown in Table 1 calls for a nuclear charge of a definite yield. The latter depends on the nature and size of the target, the accuracy in preparation of fire, the effect of the nuclear charge at the target, and the assumed value of the index of fire effectiveness.

Accuracy in preparation of fire is the result of the total effect of technical dispersion of a given type of missile and of errors in the preparation of fire data. It is defined as a mean error determined from tables of fire or with the help of tables prepared in advance.

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

The effect of a nuclear burst at the target depends on the yield of the nuclear charge, the type of burst (air or surface), and the degree of target protection. The radius of the zone of destruction serves as the characteristic of the effect of a nuclear burst.

Numerical characteristics of probability are called indices of fire effectiveness and are used to help estimate the possible results of fire. In carrying out a nuclear strike against enemy means of nuclear attack, or against other small-sized targets, the result of the firing can be either full destruction (annihilation) or non-destruction of the target. Consequently, a probability of destruction of the target may be assumed, and is assumed, to be the index of fire effectiveness.

In firing on collective targets (infantry company, battle group, command post, etc) which occupy comparatively large areas, the results of fire may vary in each individual case. In some cases the target may be annihilated completely, and in other cases only partially destroyed, in which event its combat effectiveness may be lost completely, partially, or not at all. And, finally, the target may not be destroyed at all. Because of this, fire effectiveness against collective targets is estimated not on the basis of probability of destruction of the target, but on the basis of the size of its smallest part to be destroyed with a prescribed probability. In planning fire for annihilation, the size of the smallest part of the target must be such that as a result of its destruction the entire target loses its combat effectiveness.

Used as supplementary indices of fire effectiveness against collective targets are the mathematical expectancy of the relative value (percentage) of the destroyed part of the target and the largest possible percentage of the destroyed part of the target.

The location, nature, and size of the target are usually determined as a result of reconnaissance, but the distribution of individual elements within the target area is usually not known. Therefore, in computing indices of fire effectiveness, it is assumed that individual elements

of the target are evenly distributed over its entire area. Consequently, instead of determining the size of the smallest part of the target, the size of the smallest part of the target area covered by the zone of burst of a nuclear charge with a given probability is determined. It is considered that the percentage of the target area covered by a nuclear burst zone equals the percentage of the destroyed part of the target's elements.

When selecting the yield of a nuclear charge for a single missile launching, as well as when determining the expenditure of missiles for the destruction of targets if the yield of one available charge proves to be insufficient, it is necessary to know the value of the fire effectiveness index. The values of indices cannot be established on the basis of theoretical considerations alone. Their selection is based on combat operational experience and on various economic, production, and technical considerations. The accumulation of combat experience and the consideration of changes in enemy troops morale, arms, tactics, and technical equipment, and in production and economic capabilities, bring about changes in fire effectiveness requirements.

At the present time, when selecting yields of nuclear charges, the probability of destruction of enemy means of nuclear attack and of other small-sized targets is assumed to be 90 percent. This means that, when firing against such targets with charges of a selected yield, in 90 cases out of 100 they will be annihilated, while in the other 10 they will not be destroyed.

When selecting yields of nuclear charges for the annihilation of collective targets, the minimum size of target area which, when destroyed, constitutes the destruction of the entire target, is 40 percent. Thus, the probability of destruction of at least 40 percent of the target area is assumed to be equal to 90 percent. This means that, when firing charges of a selected yield on collective targets, in 90 cases out of 100, 40 percent or more of the target area will be annihilated, while in the other 10 cases less then 40 percent of the target area will be destroyed. In the future the minimum part of the target area with 90 percent destruction probability will be called the reliably destroyed area (nadezhno porazhayemaya ploshchad) and will be designated S_o.

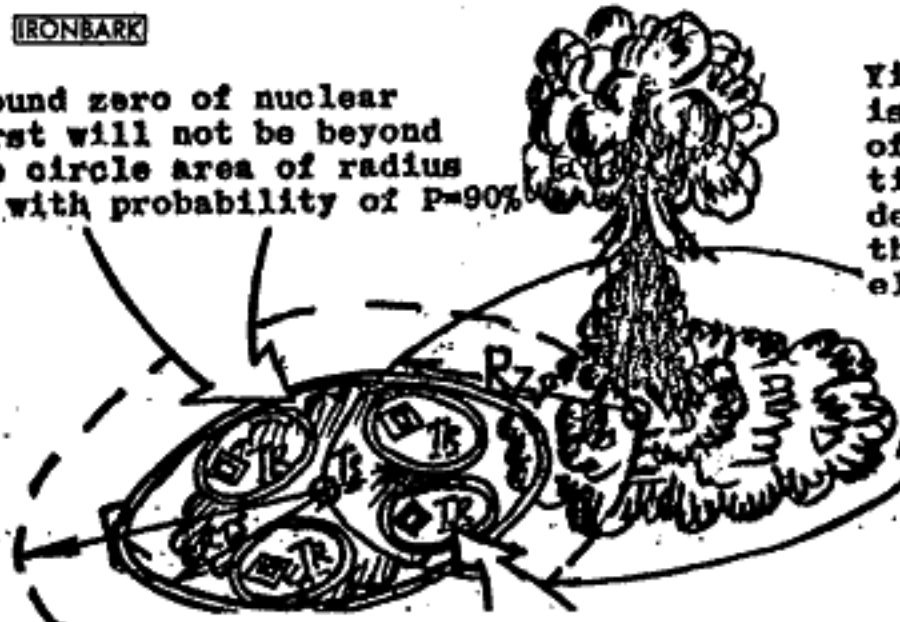
[redacted]

[redacted] 1.3(a)(4)



[redacted] 1.3(a)(4)

IRONBARK

[redacted] 1.3(a)(4)

When selecting the necessary yield of a nuclear charge, it is necessary, first of all, to determine the radius of the nuclear burst zone, R_z, which will assure coverage by the burst zone of the entire small-sized target, or 40 percent of the area of a collective target. For this, a circumference is drawn, using the aiming point (center of the target) as its center, with a radius, R, that would assure 90 percent probability of hitting within its circle in firing a given missile at a given range (Sketches 1 and 2).

The radius of a nuclear burst zone, R_z, which will assure the destruction of a small-sized target is assumed to be equal to the radius of the drawn circle (Sketch 1).

When determining the radius of a zone, R_z, which will assure the destruction of a collective target, a point on the circumference of radius R (Sketch 2) is selected as the center of a circle with a radius that would have the circle over 40 percent of the collective target.

Using the calculated radius of the zone R_z, it is possible, with the help of special reference books, to determine the yield of nuclear charge necessary for the destruction of a given target, depending on the nature and degree of cover of the target and on the type of nuclear burst (air or surface).

In practice, the yields of nuclear charges necessary for the destruction of given targets are determined with the help of previously prepared charts or tables. Charts P-1, found in the Information Collection of the Artillery No. 50, may serve as samples of such charts. The tables are found in the Manual of Firing and Fire Control of Operational-Tactical Missiles.

Sketch 3. Chart of the Relationship of the Required Nuclear Charge Yields to Firing Errors and the Nature of the Target.

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

Sketch 3, which was prepared for the typical targets listed in Table 1 and which is based on the average sizes of these targets, shows the relationship of the necessary yield of a nuclear charge, q, to the nature and size of the target and the characteristics of firing errors, when using the above-indicated values of indices of fire effectiveness.

With the help of this chart, on the basis of a known value of the characteristics of errors in fire preparation, r, of a given type of missile, it is not difficult to determine the yield of a nuclear charge of a given type of missile necessary to annihilate the target.

Example 1.
Determine the yield of nuclear charge, q, necessary for the destruction of a mount of a "Redstone" guided missile with an air burst, when firing a missile, whose average error in fire preparation is 540 m.

On the chart in Sketch 3, a perpendicular line is drawn from point r = 540m to where it intersects Line No. 28, which represents the launching mounts for the "Corporal" and "Redstone" guided missiles. The reading on the vertical axis opposite the point of intersection is q = 120 kt.

The above answer means that, when firing a missile with a mean firing preparation error of 540 m and a nuclear charge with a yield, q = 120 kt, a "Redstone" guided missile mount will be destroyed with a probability of 90 percent.

Example 2.
With the same conditions as in Example 1, determine the yield of nuclear charge necessary to annihilate a battle group in a concentration area.

On the same chart draw a perpendicular from point r = 540 to where it crosses Line No. 7, which represents a battle group in a concentration area. The reading on the vertical axis opposite the point of intersection is q = 27 kt.

[redacted] 1.3(a)(4)

[redacted]

1.3(a)(4)

IRONBARK

The above answer means that under the specified conditions a nuclear charge with a yield of q = 27 kt will annihilate not less than 40 percent of the target area with a probability of 90 percent.

A study of the chart showing the relationship of the necessary yield of a nuclear charge q to the nature of the target and the characteristics of firing errors allows the following conclusions to be drawn.

1. With an increase in the errors of fire preparation, r, there is an increase in the yields of nuclear charge necessary to destroy the target. For example, to annihilate a "Corporal" or "Redstone" guided missile launching mount with a missile, when the mean error of fire preparation is r = 100 m, a nuclear charge of approximately 2 kt is required, and, when r = 500 m, a charge of approximately 90 kt yield is required.

2. When firing missiles which have a mean fire preparation error of 0 to 300 m, the nuclear charge yield, q, necessary to annihilate a collective target depends on the nature and size of target and does not depend, or depends only to a small degree, on the characteristics of firing errors. For example, to annihilate a battle group in a concentration area (Line No. 7 of the graph in Sketch 3) with a missile, when the mean fire preparation error is r = 0, the required yield of nuclear charge is q = 18 kt. To annihilate the same target, but with a missile with a mean error of fire preparation of r = 300 m, a nuclear charge of the same yield, q = 18 kt, is required.

It follows that, based on the requirements for the destruction of collective targets, in creating new missiles, primarily those of an operational-tactical designation, the accuracy of fire preparation may be within the limits of 200-300 m.

However, in the course of combat there will be instances when the distance between small units of our own troops and the counterattacking (attacking) sub-units of the enemy, or the enemy's line of resistance, will be 1.5 to 2 km. In these instances, the nuclear charge yield and the mean fire preparation error must be minimal in order to insure a safe distance of 1.5 to 2 km for our own troops. Figures show that this requirement

[redacted]

1.3(a)(4

[redacted]

1.3(a)(4)

is met by missiles with a mean fire preparation error of not more than 100 m and with a nuclear charge yield of 1 to 2 kt. The aforementioned missiles will allow the annihilation to the required degree of destruction, of such most typically close combat targets as an infantry company on the offensive or on the defensive. These same missiles will assure the destruction of enemy tactical means of nuclear attack and certain other targets shown in Table 1.

3. It is evident from the chart (Sketch 3) that when there are large fire preparation errors, the nuclear charge yield necessary for the annihilation of a collective target depends to a large degree on the nature of the target and fire errors, and not on the size of the target. For example, with a mean fire preparation error of r = 1000 m, the same nuclear charge yield, q = 120 kt, is required for the annihilation of an infantry company on the offensive in an area of 1 sq km or of a battle group on the offensive in an area of 20 sq km (these targets are represented on the chart by Lines No. 1 and 2). To annihilate these same targets when they are on the defensive, and when the personnel are protected in trenches (these targets are represented on the chart by Lines No. 4 and 5), a nuclear charge with a yield of 500 to 550 kt is required.

It is evident from the examples cited above that missiles which have large errors in fire preparation and which have a maximum range of over 500 km must be armed with charges of large yields (from 100 to 600 kt) and be used for the annihilation of large collective targets. It is inadvisable to use such missiles and charges in firing on small-sized collective targets, because the employment of large yields of nuclear charges against such targets would be wasteful.

The chart in Sketch 3 may be used directly when planning nuclear strikes against various targets. Also, with the help of this chart, it is possible to prepare, in advance, tables of the yields of nuclear charges necessary for the destruction of various targets by a single firing of a missile of a given type.

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

IRONBARK

[redacted] 1.3(a)(4

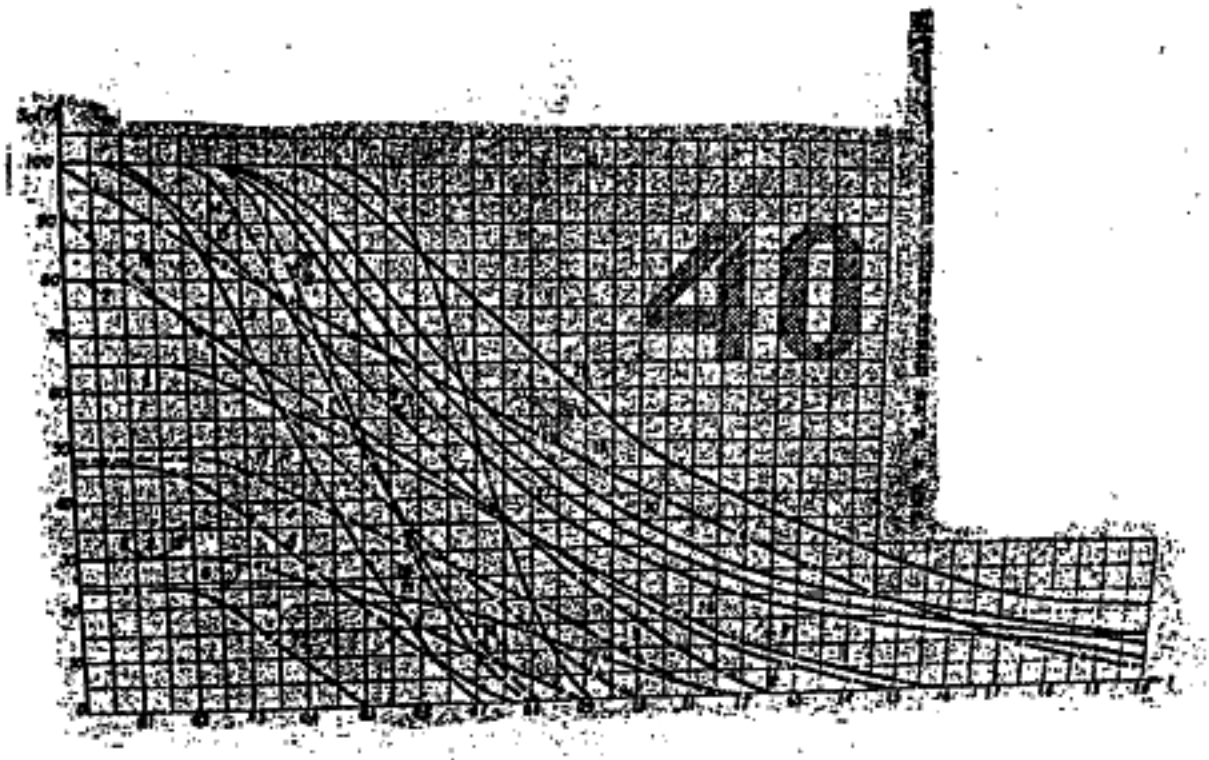
It is evident from the chart (Sketch 3) that the annihilation of the targets shown in Table 1 with the assumed degree of destruction requires nuclear charges of yields from 1 to 500 kt and higher. In practice, each type of missile has a small choice of nuclear charge yields with which all the missions for this missile must be fulfilled. For example, the missile R-170 has nuclear charges with yields of 10, 20, and 40 kt. Therefore, when planning missile/nuclear strikes and determining the necessary yield of the charge, one also has to determine the expected degree of destruction when firing on the target with a charge of a given yield, i.e., to find out what the value of the fire effectiveness index will be, if a given target is hit with a nuclear strike with a yield which is different from one selected in accordance with the chart (Sketch 3).

At the present time, this very important problem is solved with the help of previously prepared charts, ..., such as the ones found in the Information Collection of the Artillery No. 50. These charts permit, with realistically acceptable accuracy, the determination of the expected degree of destruction for any nuclear charge yield.

As previously stated, tactical and operational/tactical missiles have a comparatively small choice of nuclear charge yields; this makes it possible to draw up in advance for each yield quite simple charts of the relationship of the degree of destruction (the probability, P, of destruction of a small-sized target or of the reliably destroyed area, S_o, of a collective target) to the nature of the target and fire preparation errors.

Sketch 4 shows an example of such a chart drawn for a nuclear charge with a yield of 40 kt and for the targets listed in Table 1.

[redacted] 1.3(a)(4)



[redacted]

[redacted] 1.3(a)(4)

Besides the expected degree of destruction, such a chart also reveals the largest possible percentage of the destroyed portion of a collective target. The expected degree of destruction is determined in a way similar to that of determining the necessary nuclear charge yield from the chart in Sketch 3. In order to arrive at the maximum possible percentage of the destroyed part of a collective target, r is assumed to be equal to 0, and the rest is done in the same manner as when determining the expected degree of destruction.

Example 3.
Determine the reliably destroyed area and the highest possible percentage of the destroyed part of a battle group in a concentration area, if it is planned to fire a missile with a nuclear charge of 40 kt yield and with a mean fire preparation error of r = 600 m.

On the chart in Sketch 4, a perpendicular line is drawn from point r = 600 m to where it intersects with Line No. 7, which represents a battle group in a concentration area. The reading on the vertical axis opposite the point of intersection is S_o = 44 percent. The reading at the point of intersection of Line No. 7 with the vertical axis (r = 0) is S_o = 65 percent.

The result obtained indicates that, when firing under specified conditions, in 99 cases out of 100 the destruction of the target area will be 44 to 65 percent. In the other 10 cases the destruction will be less than 44 percent of the target.

It may happen in practice that, in order to achieve destruction of a given target, a nuclear charge of a certain yield is required but that the only charges available are those of a different yield. If the yield of the charge is greater than is required, the reliability of destruction of a given target will be greater. Example 2 shows that in order to destroy a battle group in a concentration area, a nuclear charge of q = 27 kt is required. It is not difficult to determine from the chart in Sketch 4 that if the same target, under the same conditions, is hit with a nuclear charge of 40 kt yield, the reliably destroyed part of the target area will be 48 percent instead of 40 percent.

If the yield of an available nuclear charge is smaller than that necessary for the destruction of a given target, several nuclear charges may be used in order to fulfil the fire mission with the required reliability. The number of nuclear charges equivalent to one charge of a required yield may be determined from tables usually found in the manuals for firing and fire control of tactical and operational-tactical missiles.

It should be noted that if there is no tactical necessity for a simultaneous strike by all the missiles assigned to a given target, it is advisable to deliver the strikes successively. However, each successive strike is to be made only if the previous one failed to destroy the target.

Very often a target, especially such as the means of nuclear attack, will be destroyed by the initial firing with a nuclear charge of a small yield. Thus, Example 1 shows that the nuclear charge needed to destroy a "Corporal" guided missile mount must be 120 kt. If, under the same conditions, a strike is made with a charge of 40 kt, then, as is evident from the chart in Sketch 4, the probability of destruction of this target with the first strike will be 67 percent. This means that in 67 cases out of 100 the target will be destroyed by the very first shot. A second shot will be necessary only in 33 cases out of 100.

In conclusion, we wish to note that the above-mentioned problems of evaluation of fire effectiveness, although basically simple, are labor-consuming and take up much of the time and energy of generals and staff officers. Electronic computers capable of rapidly solving not only such problems as were mentioned here, but many other problems dealing with troop and fire control, are being developed at the present time and will be issued to the troops as they become available.

SOURCE : A reliable source (B).

Following is a verbatim translation of an article entitled "Questions of the Development of the Organizational Structure of the Tank Troops", by Major-General of Tank Troops G. Zavizion.

This article appeared in the 1961 Fourth Issue of a special version of the Soviet military journal Voyennaya Mysl (Military Thought). This journal is published irregularly and is classified TOP SECRET by the Soviets. The 1961 Fourth Issue went to press on 20 October 1961.

Headquarters Comment: The Zhadov article cited on page 2 was disseminated as [redacted] 1.3(a)(4)

Headquarters Comment: "Military Thought" is published by the USSR Ministry of Defense in three versions, classified RESTRICTED, SECRET, and TOP SECRET. The RESTRICTED version is issued monthly and has existed since 1937. The SECRET version is issued irregularly. By the end of 1961, 61 issues had been published, 6 of them during 1961. The TOP SECRET version was initiated in early 1960 and is also issued irregularly.

Questions of the Development of the Organizational Structure of the Tank Troops

by

Major-General of Tank Troops G. Zavizion

The necessity of constant study and research of the organizational forms of the types of armed forces and arms of troops is evoked by the rapid development of the means of armed combat and the changes taking place in the methods of its conduct. Therefore, it is no mere chance that in recent times, considerable attention is devoted to questions of improvement of the existing, and creation of a new, organization of troops in the pages of the military press, higher military-educational institutions and among the troops.

Quite properly, in our opinion, General of the Army A. S. Zhadov noted in his article that modern armies are more and more being equipped with the latest means of armed combat, which require corresponding organizational development, and that the problems of the improvement of the organization of the troops are now posed by life itself.[1]

At the Military Academy of the Armored Troops, a military-scientific conference was conducted, where the problems of the employment of tank troops and the prospects of the future development of their organizational forms were examined.

Marshal of Armored Troops P.A. Rotmistrov, in his lecture, convincingly showed the basic directions which the improvement of the organizational structure of the tank troops should take. In the course of the work of the conference this question was subjected to wide discussion.

1. Special Collection of Articles of the Journal "Military Thought", Second Issue, 1961.

[redacted] 1.3(a)(4)

[redacted]

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

IRONBARK [redacted] 1.3(a)(4)

In the present article, taking cognizance of the opinions expressed at the aforementioned conference and in the periodical military press, we would like to present several proposals as to the paths of future development of the operational forms of our tank troops.

The organizational forms of the tank troops must conform fully to the conditions and requirements of the conduct of operations of a missile/nuclear missile war with effective use of combat equipment. They must raise the offensive capabilities of the tank troops, ensuring the independent delivery by tank formations and large units of deep and powerful missile/nuclear and tank strikes with the aim of maximum destruction of the enemy and successful accomplishment of operational and combat tasks of the most diverse kind and intensity.

First of all, it is necessary to raise sharply the firepower and the penetrating ability of tank troops, which now must be understood as the aggregate of powerful nuclear fire and the swift strike of tank large units and units. This can be achieved by saturating the tank troops with organic missile units and subunits, having as armament missiles with great range and accuracy of destruction compared with those presently in being, increasing their total number, and also by creating new tank armament, capable in the course of combat of successfully destroying enemy objectives and eliminating the need for conventional artillery to the extent that it has been present up to this time. In the composition of tank troops, along with missile/nuclear means, it is important to have, not the usual tube artillery, but subunits and units of rocket artillery, capable of delivering massed fire against objectives not neutralized by missile/nuclear weapons and deployed on such areas that their destruction would require calling for concentrated fire of entire artillery or tank subunits. It is self-evident that the organic combination of tank and missile troops by amalgamating them into one easily controlled tank troop organism will give the greatest effect, if in addition we replace the existent armored equipment with new, more mobile vehicles, having better roadability and maneuverability, and create missile means with smaller overall dimensions than at present.

[redacted] 1.3(a)(4)

[redacted]

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted]

IRONBARK The increase of firepower, striking force, mobility, and maneuverability will ensure the high mobility of the tank troops and their capability to conduct combat operations independently to a considerably large depth, at high speeds. Namely, this must be considered the most important thing in the future development of tank troops, the basis of which must be tank subunits and units and the missile troops paving the way for them. Saturation of tank troops with missile/nuclear weapons and new tank equipment will bring about a reduction in the personnel and auxiliary equipment, not taking part in combat directly.

We feel, that further development of the organizational forms of tank troops should also take the line of considerably increasing their ability to survive under conditions of a missile/nuclear war.

In a modern battle and operation, the least vulnerable to nuclear bursts are the tank crews (ekipazh) and missile launcher crews, (raschet) covered by heavy armor. To increase the offensive capabilities of the large units and formations of tank troops, along with equipping them with essentially new tank and missile armament, it is also necessary that the auxiliary organic means not differ from the new tanks in their antinuclear stability, maneuverability, and mobility.

Primary in ensuring the tank troops' viability will be the increase of their nuclear power, which, in the course of the operation, will allow them quickly and to a great depth, to neutralize reliably the enemy's nuclear means of attack.

On a level with increasing the mobility and defensibility of the tank large units and formations from the destructive factors of a nuclear burst, improving the viability of the tank troops will also promote establishment of the maximum possible uniformity of their organization.

Uniformity of units and large units, under modern conditions, must be viewed as an indication of the strength and stability of the organization of troops. It is achieved by unity of the form of organization of tank troops, the presence in the units and large units of similar type tank subunits and the maximum possible equality of the mobility and defensive characteristics of the different

[redacted] 1.3(a)(4)

[redacted]

[redacted] 1.3(a)(4)

auxiliary combat equipment to those of the tanks, and also the presence in them of the minimum number of mechanized infantry in the new combat vehicles.

The subunits of mechanized infantry, antiair defense, rear services, security and command in the tank large units also should have increased roadability and their personnel should be covered with armor with new defensive features. The interests of increasing the viability of the tank large units also require an organizational change in the supporting subunits. For example, there is an urgent necessity to centralize the antiair defense means in large measure, which will considerably simplify the control of them and will ensure more dependable troop cover in the course of combat operations.

For the purpose of maintaining the constant combat effectiveness of the tank troops and, consequently, increasing their viability, it is required that a constant reserve of subunits and units be included in their complement.

It is also necessary organizationally and technically to ensure the capability of the tank units and large units to liquidate independently and quickly the results of enemy nuclear and chemical attack. This need may be answered by training the troops to take the proper measures and equipping tank units and large units with special, highly efficient organic means.

Great significance under modern conditions is attributed to the capability of the tank units and large units to, repair in a short time, armored and other equipment damaged as a result of massed missile/nuclear weapon strikes and conventional means of destruction. In view of this, it is necessary to have repair-rehabilitation subunits and units, equipped with high-efficiency means in the tank troops.

Increasing the tank troops' viability and that of the ground troops as a whole, to a significant degree, will promote the radical realignment of the system of control with the introduction of means of automation and mechanization, and also alteration of the organizational structure of staffs, directed toward elimination of some

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

levels and increasing the mobility of the control points.

Finally, the reorganization of rear services subunits, units, and installations, wider use of air transport for support of swift maneuver and accomplishment of the tasks of supplying the troops in the course of vigorous and continuous combat operations - is one of the most important conditions for increasing their viability. With this aim, we consider it necessary to reinforce the tank army with military-transport aviation means.

Such, in our opinion, are the general principles, on the basis of which the organizational forms of the ground forces can be developed practically and above all those of tank formations, large units, and units.

We feel that the tank army's prospective organization may consist of five tank divisions, one missile brigade (division), one PVO division, separate reconnaissance units, and units of rear support, and also separate tank and mechanized units of the reserve of the army.

In a tank division there may be four tank regiments; in a regiment - three tank and one mechanized battalion or five tank and one mechanized company. With such variations of organization, the tank division loses the need for a motorized rifle regiment in it.

In a tank battalion (in the case of battalion organization) it is expedient to have three companies of 10 tanks each. In the absence of a battalion level, a tank company may consist of 16 tanks. In a division as a whole there may, accordingly, be 380 or 320 tanks and 100 or 60 infantry combat vehicles.

Calculations show that the number of personnel and auxiliary equipment in the tank army and division of the proposed organization will be considerably reduced (though the army will also include one more division than at the present time). On the whole, this will give the division and army great mobility.

In the organization under discussion, a more efficient correlation of tank and mechanized subunits is foreseen.

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

For example, there is one mechanized company to 3.5 - 4 tank, whereas in the present organization there is one motorized rifle company to 2.7 tank companies. In this, in the complement of the tank army the number of new infantry combat vehicles will not exceed 300 to 500 units, that is, there will be a considerable reduction compared to the number of armored personnel carriers (800 units), available at the present time.

The tank army of the proposed organization, in overall numbers of tanks, will exceed a US field army made up of nine divisions and our own combined arms army of two tank and three motorized rifle divisions. This will ensure it the capability of successfully accomplishing the tasks of modern operations, where engagements and battles will be predominantly of a tank nature. The presence of five divisions in the complement of an army will broaden its capabilities for delivering strikes and for participating in operations on two axes. For defeat of the enemy in a meeting engagement and accomplishment of other tasks it will not be necessary to call in all the forces of an army, which happens at the present time, with four divisions in an army. In addition, the army will be able to carry out wider maneuver with its large units.

The creation in the tank army of a reserve consisting of two tank and one mechanized regiment will provide the opportunity in the course of an operation for the timely reinforcement of one or another division and maintain its combat effectiveness, without drawing on units of the second echelon for this and without taking the whole division out of combat. The expediency of having a reserve will be seen especially in that case, when units of one of the divisions suffer heavy casualties from the enemy's nuclear weapons, in the operations of the army on a wide front, with great intervals between large units, etc. Do not forget, that the reserve regiments of the army will constantly be replenished from those units which are taken out of combat. Replacement of the personnel of reserve regiments should be carried out first of all by detachments of those who have recovered, and tanks - by tanks of the army maintenance pool.

[redacted] 1.3(a)(4)

The mechanized regiment of the army reserve can be used as an airborne force and for the accomplishment of tasks which suddenly arise.

We have indicated above two possible variants of the organization of a tank regiment, with the battalion level and without it.

In our opinion, the battalion level of command in tank units should be abolished. We shall try to substantiate this.

First of all, let us note, that under the conditions of a nuclear/missile war the lowest tactical element which can accomplish tasks independently, and in the interests of which it is possible to employ nuclear/missile weapons must be considered to be the regiment. It, as a tactical unit, unites within itself the different arms of troops and means of combat, and has the necessary rear services. Now, when combat operations have become more maneuverable and acquired a clustered nature it is the regiment that must become the last level in which are carried out the most tightly coordinated operations of all forces and means and the direction of their efforts toward the fulfilment of combat missions. Therefore, the regiment is able to conduct combat operations on independent axes and considerably removed from the main forces of the division, cooperating during this, with tactical missile means and, when necessary, with aviation.

What, under these conditions is the role of the battalion level of command? Due to the fact that the combat operations of the battalion will be spread out over larger sectors than previously, the commander of the battalion will be unable to observe personally the course of combat operations of all subunits and directly organize and control the tank companies in combat.

Now the focal point of the organization of the attack and combat in depth has shifted to the company commander. The practice of combat training and tactical exercises shows that the commander and staff of a battalion, in organizing combat, basically duplicate all that is done by the commander and staff of a regiment. The battalion

has no organic support means so it is reinforced by regimental means whose tasks are determined by the regimental commander. Therefore, the role of the battalion commander is now reduced only to organizing the attack, which is the function of the company commander. Besides, for independent accomplishment of tactical tasks, the battalion always needs reinforcement and the constant presence of rear services subunits.

Thus, we come to the conclusion that the battalion is an intervening level.

The tank battalion has three companies, always operating in the same "stereotyped" pattern of battle order, independent of the conditions of a situation as they actually develop. More often than not, in the first echelon, two companies operate, and in the second - one company. With considerable losses in tanks, the battalion battle order usually consists of one echelon (almost all the tanks "on the line"), with the detaching of several tanks to the reserve. In these cases the commanders of companies and platoons turn into commanders of regular line tanks. Consequently, the battalion cannot vary the pattern of the battle order, in connection with which maneuver in the course of battle is sharply restricted.

We must also contend with the fact, that the tank battalion is a compact and attractive tactical objective for delivery of strikes by nuclear/missile weapons. With any pattern of its battle order, a considerable portion of its subunits will receive hits from a nuclear warhead with a yield of 20 to 40 kilotons, after which the battalion will really lose its combat effectiveness. Combat effectiveness will also be reduced in the regiment in which, in this case, there are only two battalions remaining.

The tank regiment in the proposed organization, with five tank companies and one mechanized company in its complement, will be capable of carrying out wider maneuver of its subunits in the course of battle; concentrate its efforts on one or, if necessary, on several axes, and each time adopt that battle order which suits the actual conditions of the situation to the maximum degree. In

[redacted] 1.3(a)(4)

case of destruction of one, or even two, tank companies by the enemy's nuclear weapons, the tank regiment will be significantly more combat effective than with the loss of one battalion in the present organization.

With the new regimental organization, without the battalion level, the time for organization of the battle will also be sharply reduced. The regimental commander, having made and announced his decision, will be occupied with the organization of the battle and the commander of the company directly with the organization of the attack. This organization will be more acceptable for future tank troops with fundamentally new tank weapons and improved missile means.

The chief factor determining the development of the organizational forms of the troops is nuclear/missile weapons, with the employment of which are created favorable conditions for the conduct of highly maneuverable combat operations. The nuclear/missile means now available in the tank division and tank army do not fully answer the requirements of modern operations and combat qualitatively. Of the six (R-170) missile mounts comprising the army missile brigade, it is conceivably possible to have not more than three constantly ready for launching, which, with only eight (R-30) missile launchers (raketnaya ustanovka) in the divisions, does not allow reliable destruction of the enemy in the zone of the army with missile fire. The inadequate maximum range of the organic (voyskovaya) missiles has an adverse effect on assuring the rapidity of operations of large units of the army and their independence in accomplishment of combat tasks, and also makes their participation in a massed army nuclear/missile strike more difficult. For this reason, organic missiles are obliged to move about unceasingly, within the combat formations of units, with the result that the effectiveness of their fire is sharply reduced, and they themselves are constantly under the threat of destruction by the enemy's conventional means.

In our opinion, for the successful conduct of modern operations, taking into account the trend of future development of nuclear/missile weapons, another solution

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

to the question of the availability of nuclear/missile means in the tank army is required.

First of all, the quantity of tactical and operational-tactical missile troops must be increased and their quality improved.

In the tank division it is necessary to have that number of missile mounts, which will ensure the conduct of independent combat operations to a considerable depth and at high speeds. Together with this, the missile means of divisions must be capable of executing maneuver by fire along the front and in the depth for the purpose of delivering massed nuclear strikes against the enemy jointly with army missile units. In our opinion, it is necessary to establish tank-missile subunits in the tank divisions, that is, to have tank missile mounts as armament.

Keeping in mind the prospective organization of tank large units, we figure that in each tank division the missile battalion (raketnyy divizion) must be replaced by a missile regiment (polk) of three tank-missile companies, with 4 to 6 mounts in each company, with a range of fire up to 100 km. A rocket battalion (reaktivnyy divizion) (three or four batteries of mounts of the "Grad" type) also should be included in the complement of a division.

In the army, instead of the missile brigade, it is necessary to have a missile division (brigade), composed of 3 or 4 regiments (battalions) of 4 to 6 mounts in each, with a range of fire up to 500 km.

Such an increase in the range of fire of tactical and operational-tactical missiles fills the requirements of supporting the combat operations of tank divisions to the depth of the task of the day, and of the tank army - to the depth of its immediate task (300 to 400 km), without changing, or with only a single change of siting areas, and also the execution of maneuver by fire along the front and in the depth. In addition, this will promote high tempos of offensive, closer fire coordination of division missiles with army missiles, and of the army's missiles with those of the front.

[redacted] 1.3(a)(4)

An increase in the number of missile mounts in the tank divisions and the tank army will, on the whole, raise the power and effectiveness of the nuclear destruction of the enemy and will make it possible, in the course of an operation, to deliver massed strikes of missiles with chemical and conventional filler against him. The proposed number of missile mounts will increase their number in the present tank army by four times, which, in conjunction with their increasedrange and effectiveness of fire, significantly increases the capabilities of the prospective organization of the tank army. Calculations show, that with this number of missile mounts, it is possible with one salvo to inflict overall incapacitation on personnel in tanks, in an area of up to 270 km^2, which considerably exceeds the nuclear power of an army corps of the US Army, reinforced to the maximum with nuclear means of attack.

The proposed centralization of the means of antiair defense (PVO) in the tank army envisages their concentration in one combat large unit, for example, in a PVO division, directly subordinate to the army commander. This will allow reliable screening of the troops of an army from enemy strikes from the air and will reduce the number of intervening levels of command of these means. A large unit such as a PVO division should take entirely upon itself the function of protection of the troops of the army from the air. With this, the necessity for having an intervening level of command in the person of the chief of PVO troops and his apparatus disappears, as all control of PVO means will be concentrated in the hands of the commander of the division.

The organizational structure of the PVO division should ensure the possibility of its employment both in its entire complement as well as by portions of it, and its technical equipment should ensure successful conduct of antimissile and antiaircraft combat.

As already mentioned, an important role in the improvement of maneuverability of forces and means of a tank army in the course of an operation should be played by its reinforcement with a group of military-transport aviation. In the complement of this group it is proposed to have the prospective transport aircraft and helicopters with

1.3(a)(4)

[redacted]

[redacted]

1.3(a)(4)

a large payload capacity, with which it would be possible to carry out the maneuver of the forces and means of a tank army by air.

Maximum use of the capabilities of the new armament depends on the availability in the tank large units and formations of improved means of reconnaissance which ensure the continuous conduct of radiotechnical, aerial, deep and ground reconnaissance. Subunits and units of ground reconnaissance should be air transportable and have tanks with special equipment in their armament.

The increase of the capabilities of reconnaissance to ensure effective delivery of nuclear/missile strikes against the enemy entails the necessity of including new reconnaissance units and subunits in the complement of the tank army, namely: a regiment of aerial reconnaissance, separate radio and radiotechnical battalions and a company of deep reconnaissance. Furthermore, in a regiment of aerial reconnaissance it is advisable to have pilotless means of reconnaissance, and subunits of aviation and radiation reconnaissance. In the divisions, it is necessary to establish reconnaissance battalions with the means of ground, radiotechnical and deep reconnaissance.

The new organization of the tank troops will require introduction of substantial changes in the methods of troop control in a battle and an operation, and along with this, a review of the organizational structure of the organs of command. By now, in comparison with World War II, the methods and forms of conducting a tank army operation have changed considerably and new trends in the employment of tank troops are noted, but the methods of troop control have actually remained as of old. The organizational structure of the staffs of tank large units and formations, above all, should ensure mobility of troop control. For this, in an army and division, it is necessary to abolish the large number of small, incompetent, and secondary staffs, departments, and services.

We cannot disagree with the repeated statements in the press that the mobility of command can be increased if only the chief of staff, the chief of missile troops, the chief of rear services and tank-technical services

[redacted] 1.3(a)(4)

are left directly subordinate to the commander of the army. This will free the commander from the solution of secondary questions and will assure him the opportunity of occupying himself in greater detail with the command of troops in the course of combat operations.

In the army staff it is advisable to have an operations-reconnaissance department, consisting of three sections, (planning, information, and regulation of the movement of troops); a communications department; and an engineer-technical department.

In the operations-reconnaissance department the officers of the planning section are called upon to plan the combat operations of troops and the employment of all means of combat. The responsibility of the officers of the information section should include the collection and collation of data on the situation and provision of timely operations-reconnaissance information to troops and staffs. The section for regulating the movement of troops is necessary for the organization of those numerous displacements of troops which take place in the course of the whole operation. The engineer technical department should carry on the preparation of data for the chief of staff on the combat capabilities of the engineer and chemical troops, and also supervise the accomplishment of tasks assigned to them.

An increase of the mobility of the work of the staffs will greatly promote the most rapid introduction of the means of mechanization and automation into the control of troops, and later, also the complex automation systems with electronic computing machines.

This general examination of the organizational structure of the staff of a tank army has in mind the creation of two equal and interchangeable command posts (CP Number 1 and CP Number 2) and a rear control point (TPU). In this, the means of communications of CP Number 1 and CP Number 2 can move along the primary axes of troop operations. The commander and the staff of the army can work at that CP where it will be most convenient for them at any given time, according to the situation. When the commander is working at CP Number 1, his deputy and a

group of officers are working at CP Number 2, ready to take over the control of the troops.

The fundamental postulates expounded in this article on the further development of the organizational forms of tank troops and their staffs can be fully substantiated only by providing them in special and regular troop and command-staff exercises.

A New Combat Vehicle

by

Lieutenant-General A. Shevchenko

Recently, in our military press and in the military press abroad there has been wide discussion of the role of the armed forces and the arms of troops in a future war and of the directions of future development and improvement of combat equipment and armaments. A significant place in this discussion is devoted to determining the role of tanks in a modern battle and operation. This is not accidental because the firepower, armor protection, and mobility which are combined in tanks have always given them certain advantages over the other arms of troops and permitted the successful conduct of combat operations.

At the present time tank formations and large units also have the greatest mobility and resistance to destruction by nuclear weapons; therefore, in modern operations too they are able to fulfil the quite complex and responsible missions that are assigned to them.

But this does not mean that the modern tank must be considered the ultimate in the perfection of combat equipment and that it is fully suited to conducting combat operations under the new, complex conditions. We share the opinion of Marshal of Armored Troops P. A. Rotmistrov* about the need to increase the relative proportion of the tank troops at the front level and in the armed forces as a whole, and we consider it advisable and feasible to create and introduce into the ground troops, instead of the tank, an armored vehicle of a new type that, in its characteristics and utility, would

---

* Special Collection of Articles of the Journal "Military Thought", First Issue, 1961.

[redacted] 1.3(a)(4)

[redacted]

[redacted] 1.3(a)(4)

fulfil the modern requirements to the maximum.

With the appearance of antitank guided missiles with shaped charges (PTURS) that have high armor-piercing capability, tanks lose one of their basic qualities — effective protection from the fire of these new weapons.

One cannot disagree with the opinion of Colonel-General A. Kh. Babadzhanyan*, who maintains that in single combat with an antitank missile launcher a tank will be defeated, and with the adequate saturation of the troops with these launchers, any tank attack may be broken up and a large part of the tanks participating in it destroyed, together with their crews.

It is true that antitank missiles have not yet been tried in combat and still have several shortcomings, but this is one of the types of weapons having the best long-range prospects and one which will be constantly improved. Therefore, there is little justification for the attempt by Marshal of Armored Troops P. A. Rotmistrov to prove that the new antitank missile weapons, with the availability of weapons of mass destruction, are not very dangerous for tanks and that their use allegedly will not greatly influence the employment and operations of tank troops.

In the near future, antitank missiles will comprise the greatest danger for tanks with any armor protection, and the use of the PTURS on armored vehicles and the improvement of the means of guiding the missile to the target will make them even more menacing weapons.

Should we pose the problem of further increasing the thickness of tank armor under these conditions? Of course not. One should speak of a sharp increase in the firepower of the tank by replacing the gun with a missile launcher.

---

* Special Collection of Articles of the Journal "Military Thought", First Issue, 1961.

A correct solution of this problem is offered by General of the Army A. S. Zhadov*, when he speaks of the need to arm the modern tank with the most advanced missile weapons, that ensure the destruction of any enemy tanks or other objectives at great distances during combat.

As far as the mobility of the tank is concerned, it is relative, and does not fully meet the requirements of a modern operation and battle, which are conducted at high tempos. Just as before, water barriers are a serious obstacle for heavy and medium tanks.

Therefore, destructibility by the fire of new antitank weapons, the comparatively weak firepower, and the inadequate cross-country ability and mobility of the tank demand its replacement by a combat vehicle of a more improved type, which is capable of performing comprehensive combat missions.

In a modern battle and operation, success is achieved by the joint efforts of the missile, tank, motorized rifle, artillery, and other large units and units in close coordination. But the fact that at the present time each arm of troops has different combat capabilities, unequal protective capability against the destructive factors of nuclear weapons, and therefore is not suited for the fulfilment of all the comprehensive operational and combat missions independently, can lead not only to the disruption of coordination but in several instances to the loss of the combat effectiveness of formations and large units.

That is why it is necessary to have a combat vehicle that, at the very least, would combine in itself the combat features that are inherent in tanks, missiles (artillery), and motorized rifle subunits. Such a vehicle must ensure the successful fulfilment of various combat tasks successively accomplished in the offensive and on defense, have maximum protection from weapons of mass destruction, and at the same

---

* Special Collection of Articles of the Journal "Military Thought", Second Issue, 1961.

time serve as a means of transportation for personnel and armament. Firepower, armor protection, and mobility have to find a new balance in it, in the presence of a new quality — versatile, universal utility.

The new combat vehicle must have the following:

--improved means of reconnaissance and communications permitting the detection of enemy targets and objectives at great distances and the maintenance of reliable communications between vehicles, subunits, and units;

--powerful armament capable of destroying enemy personnel in armored vehicles and outside them and also various combat equipment at considerable distances;

--an adequate amount of ammunition, calculated for 1 to 2 calendar days of combat operations.

The speed of such a vehicle must reach up to 80 kph on roads and up to 50 kph off roads, and must have a supply of fuel for 700 to 1000 km and high cross-country ability, including rapid crossing of zones of radioactive contamination, water barriers, and various obstacles and obstructions.

Armor protection and hermetic sealing of the vehicle must ensure reliable protection of personnel from small-arms and fragmentation injuries and from the effects of radioactive and toxic substances, bacteriological agents, thermal radiation, and, if possible, the shock wave.

It is proposed to have the vehicle hold 7 or 8 persons, preferably with means for digging themselves in: a crew of 2 or 3 persons and a combat team of 4 or 5 persons having the capability of conducting fire directly from the vehicle in motion, and when necessary of performing combat missions after dismounting. At the same time, the team is assigned the duties of operating instruments, servicing the vehicle, concealing it, etc.

[redacted] 1.3(a)(4)

Consequently, unlike the tank, on which riflemen can operate only as riders, in the proposed vehicle the team is an integral part of the vehicle, as well as of the combat element. It is planned to have the new combat vehicle simultaneously replace the tank, armored personnel carrier, and partially the gun with a prime mover.

Lieutenant-General N. F. Slyunin* also speaks of the need to create a new combat vehicle to replace the existing tank. However, he examines it from slightly different positions, taking the concept of atomic resistance as the basis for its creation and defending the retention of the combat vehicles for the infantry and artillery (for example, an artillery regiment remains in the division, etc.). Naturally, a vehicle of this type will not be a universal vehicle, but an improved armored personnel carrier which cannot eliminate the existence of tanks.

In the combat vehicle it is not absolutely necessary to have large stocks of foodstuffs and water, much less bunks to provide rest for the personnel, as proposed by Lieutenant-General N. F. Slyunin.

It appears to us that, besides the proposed combat vehicle, it is necessary to have vehicles capable of performing more complex fire missions. For this purpose, the means for using nuclear weapons, and also antiaircraft weapons, are mounted on such vehicles. The creation of groups of such vehicles in companies and regiments will strengthen the fire support of line subunits, give them great independence, and will ensure the successful fulfilment of combat missions.

For the firm and continuous control of troops, it is also necessary to have command combat vehicles with modern armament and equipped with the necessary means of communications.

---

* Collection of Articles of the Journal "Military Thought", No. 1 (56), 1961.

The basis of the combat formations of subunits and units under these conditions will be made up of line, command combat vehicles and a certain number of special combat vehicles comprising groups of fire support.

At the modern stage of development of Soviet tank building, the amphibious tank or the amphibious armored personnel carrier serve as the basis for creating a universal combat vehicle.

The introduction of a new type of combat vehicle into the armament of the troops will fundamentally influence the organization of the troops. First of all, the need ceases for arms of troops such as tank, motorized rifle, and artillery. To replace them, it is necessary to create unified armored troops with subunits, units, and large units of a unitary type.

The crew and team of each combat vehicle may be a squad, and 5 to 7 squads (vehicles) comprise a platoon. In the line vehicles of the platoon, it is advisable to have means for combating personnel, including those located in shelters, and enemy armored vehicles, for which it is possible to use missile weapons, large-caliber machine guns, and grenade launchers. It is desirable to have PTURS mounted on all vehicles.

In the company, it is advisable to have three platoons and a fire group (2 or 3 vehicles, including the commander's vehicle) with means for using nuclear weapons.

At the present time a tendency exists to have one or two intermediate levels between the company and the division. It appears to us that a division should consist of regiments in which it is advisable to have companies, but excluding the battalion level. The elimination of the battalion level with the presence of new combat vehicles of one type will not have a negative influence on the fulfilment of tasks by the regiment, even though the battalion, with the loss of combat effectiveness by two companies, will obviously lose its independence. Troop control and their dispersal during

combat operations will also become simplified. Besides that, the battalion level is not directly tied in with materiel and technical support measures.

With the introduction of the new combat vehicle, the regiment can consist of up to five companies, a fire group, means of combat support, and corresponding rear services.

The regimental commanding officer's fire group must include missile launchers, antiaircraft guns for combat with low-flying enemy airplanes, means for combating radio-technical equipment, and special vehicles for conducting reconnaissance. Special subunits to eliminate the after-effects of an enemy nuclear attack should be introduced into the regiment.

The unitary division may include 4 or 5 regiments having the same composition. This number of regiments will permit the execution of a broad maneuver on the battlefield, form the most diverse combat order, and disperse the troops even more, especially in depth. Naturally the division, apart from the regiments, will have the means of combat, materiel, and technical support. A division with the proposed complement will have a total of 500 to 600 combat vehicles, and it will have a strength of 6000 to 7000 men. Such a division will surpass a modern tank, and, especially, a motorized rifle division, in fire and striking power, and also in mobility and maneuverability.

In our opinion, the army must mainly have divisions with identical organization. When necessary, separate divisions may vary from the standard organization — for example, divisions intended for operations in a mountainous area, as an airborne force, etc.

We consider that for the timely reinforcement of divisions, wider use of airborne forces, and for performing other tasks, it is necessary to have one or two reserve regiments – 12 to 18 companies – in an army.

[redacted] 1.3(a)(4)

These are our proposals for troop organization. At the present stage of development of the organizational structure of troops, the creation of new large units may be carried out on the basis of tank and motorized rifle divisions. For example, from two tank and two motorized rifle regiments it is possible to create a division composed of four regiments, with four companies in each regiment. Initially, the company can have 10 to 15 tanks, 4 or 5 armored personnel carriers, and fire support weapons. At first the basis of the combat power of such subunits will consist of tanks.

Closer coordination of tank and motorized rifle subunits is ensured with such organization. These will be detachments of a special type, having high maneuverability, great striking force, and the capability of performing combat tasks that are more varied in nature. Moreover, the faults of modern tank and motorized rifle regiments are eliminated, and measures connected with the dispersal of troops and increasing their viability will be conducted with greater success.

At the same time, the army may include separate divisions with a complement of modern motorized rifle regiments, but without tanks, with an adequate quantity of antitank weapons and more powerful weapons to neutralize the enemy with fire. Such "light" divisions may be designated for the consolidation of lines, for conducting combat operations in populated points and on terrain that is difficult for tanks to transit, and also may operate as airborne forces.

The proposed organizational measures permit the use among the troops, during combat training, of new methods of combat operations which meet modern requirements.

Only general questions of the creation of a new combat vehicle and the improvement of troop organization are set forth in this article. It seems to us that the time has come for a broader discussion in print of problems pertaining to this field of military theory and practice.

The "FALLEX-60" Maneuvers of the Armed Forces of the NATO Aggressive Bloc

by Colonel-General S. Ivanov

From 20 September through 1 October 1960 maneuvers were held by the armed forces of the NATO aggressive bloc under the provisional name of "FALLEX-60". They embraced the territory of Europe, North Africa, the Central, Northern and Eastern Atlantic, the Baltic, North, and Mediterranean Seas, and also the territory of the USA and Canada.

Taking part in the maneuvers were the command elements and staffs of all the combined armed forces of NATO in Europe, the Atlantic, and the Mediterranean Theater of Military Operations, the command elements and staffs of formations and large units of ground troops, air forces and naval forces, aviation units of combined and national air forces, warships, ships, and land-based aircraft, ground and airborne troops, missile units, and atomic artillery - in all about 200 staffs, up to 5000 aircraft, 580 warships and ships and more than 200,000 men of the combined armed forces of the bloc. In addition there were involved in the maneuvers the general staffs and staffs of the branches of the armed forces, the command elements and staffs of air defense troops and territorial troops, the central directorates or departments of the ministries of internal affairs, transport, economics, communications, health, etc, of all the member nations of NATO, with the exception of Portugal and Iceland.

At the beginning of the maneuvers the armed forces of all the NATO member nations were brought to heightened combat readiness, as were all their organs of military leadership and a considerable number of civilian departments. These maneuvers pursued not only military, but also political, goals.

As is well known, reactionary circles in the USA and some other imperialist countries, frightened by the possibility of the establishment of a lasting peace, were striving

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted]

feverishly in 1960 to increase international tension, together with the arms race and preparation for a new war. The ruling circles of the USA committed openly aggressive acts against the Soviet Union in the form of the incursion into our air space of reconnaissance airplanes, and disrupted the Paris Summit Conference and the work of the Committee on Disarmament. The American imperialists, together with their partners in the bloc, organized intervention against the Congo and Laos, and tried by force to stifle the revolution in Cuba.

All these actions of the reactionary powers, which were dangerous for the cause of peace, received a decisive setback on the part of the Soviet Union and other peace-loving countries; the aggressive plans of the imperialists were disrupted. By the autumn of 1960 the Eisenhower administration was in a position of international isolation. In this situation the Soviet Union made the proposal to hold the XVth Session of the General Assembly of the UN with the participation of the heads of state, to settle the most important problems for the strengthening of peace.

The ruling circles of the USA and other imperialist nations adopted measures for keeping N.S. Khrushchev and the heads of government of the other Socialist nations out of the General Assembly and for hindering the discussion in the UN of the unresolved international problems. Among the measures designed to attain these ends were the "FALLEX-60" maneuvers.

The maneuvers, since nearly all the member-nations of NATO took part in them, also had the goal of demonstrating the strength and "unity of the free world" as a defense "against the threats of Communism". This was considered all the more important under existing conditions when growing contradictions were gradually eating away the aggressive bloc. The "FALLEX-60" maneuvers must therefore be assessed as one of the major provocations of the aggressive imperialist powers, in pursuit of definite political goals - to enflame the world situation and aggravate international relations. But the provocation failed: the XVth General Assembly of the UN took place with the participation of the heads of government of the majority of the nations of the world. The tireless activity of N.S. Khrushchev at the

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted]

[redacted] 1.3(a)(4)

session was crowned with notable success. N.S. Khrushchev advanced important proposals on the questions of disarmament, the liquidation of colonialism, changes in the structure of the leading organs of the UN and on other topics, directed toward the strengthening of peace. All these proposals met with the support of many nations and the warm approbation of the progressive forces of the world.

The military goals of the maneuvers were to check the preparedness of the command elements of the headquarters, the national organs and the combined armed forces of NATO (principally of aviation, the navy and missile units) for carrying on joint operations, especially nuclear, in the initial period of a war, and also to check how far the operational-strategic plans which had been developed correspond to reality, and thereby to increase the overall combat readiness of their armed forces. In the maneuvers there were worked out in essence all types of modern operations: offensive and defensive operations of air forces, missile units, ground troops, and the navy.

The "FALLEX-60" maneuvers consisted of approximately 20 exercises, conducted under an overall concept and against the background of the situation determined by the political goals outlined above. The concept of the maneuvers consisted of exhibiting itself as the "victim of aggression", of launching a "counterblow" against the enemy with nuclear weapons, of gaining nuclear superiority and supremacy in the air, and thereby creating conditions for the seizure of the strategic initiative and for the ground forces to pass to the counteroffensive, and thus to destroy the opposing forces of the "aggressor". Under this concept the goal was pursued of concealing the real plans of the NATO leaders, which are based essentially on an offensive doctrine, a pre-emptive strike and direct attack on the nations of the Socialist Camp.

The "FALLEX-60" maneuvers were two-sided. On one side was "Blue", the armed forces of NATO, and on the other was "Orange" the armed forces of the Warsaw Pact nations. The maneuvers were divided into two stages: in the first stage were worked out the first operations of all branches of the armed forces under the conditions of the initial period of war, as planned in peacetime; in the second stage were worked out the subsequent operations of this period, on the basis of the conditions which develop

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

during the course of a war after it has begun.

The initial situation preceding military operations was a lengthy period of worsening relations between the member nations of NATO and the member nations of the Warsaw Pact. From February on, both sides were carrying out secret preparations for war. At the end of August the NATO countries secretly began partial mobilization, and transferred French divisions from Africa to Europe. From 6 September the movement of naval forces from bases in the US to the northeast part of the Atlantic began. Five days before the beginning of military operations (16 September) the "military alert" signal was given, the NATO striking fleet was formed, the forces of anti-submarine defense were deployed in the Atlantic, and tactical aviation was transferred to bases in Norway and Greece (one squadron in each). Ten hours and thirty minutes before the start of military operations, a simple alert was declared. From this moment all the armed forces of the bloc began to be brought to complete combat readiness. In 15 minutes almost all aircraft were in the air and the missile units and atomic artillery were brought to readiness for the use of nuclear weapons. At 0519 hours on 21 September the general alert was given - the beginning of military operations.

A similar buildup of the situation before the beginning of a war has been a feature of other exercises held earlier, among them "MAXIMUM TENSION" and "SIDE STEP". However, in past exercises for bringing the armed forces to complete combat readiness it took up to two days, while in the "FALLEX-60" maneuvers 10 hours and 30 minutes were spent. This could be achieved because the striking forces (missile units and aviation) were already at combat readiness in peacetime, while the ground forces were at half strength and had a corresponding quantity of ammunition and items of equipment in the hands of the troops.

In the first stage of the maneuvers, nuclear strikes were launched against "Orange" with strategic and operational-tactical means, i.e., in the terminology of NATO, a nuclear offensive took place, which lasted about seven days. This constituted the main component of the first stage. The ground troops conducted operations with the purpose of supporting the nuclear attack (defensive operations) and

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted]

got ready to go over to the counteroffensive. The navy also participated in the nuclear attack, and conducted operations to destroy the "Orange" naval forces and to protect the sea and ocean lines of communication.

The principal exercise of the first stage was Exercise "FLASH BACK-1". in the course of which were worked out problems of nuclear attack and the conduct of operations by groupings of ground troops and air forces in the European theaters of military operations (cf. Fig. 1). For this there were deployed:

--in the Central European Theater of Military Operations- the Northern Army Group, consisting of four army corps (12 divisions); the Central Army Group, consisting of the Seventh Army (US), and the First Army (France), comprising six army corps in all (13 divisions); the Second and Fourth Combined Tactical Aviation Commands and the Third Air Army (US), comprising in all 2,342 aircraft of tactical aviation and 200 aircraft of strategic aviation; 60 intermediate range "Thor" missile launchers; 30 "Mace"and "Matador" cruise missile (krylataya raketa) launchers; and 45 battalions of tactical missiles and atomic artillery;

--in the Southern European Theater of Military Operations- an Italian army group, consisting of two armies (four army corps and separate large units, 12 divisions in all) and a missile command (five "Corporal" and "Honest John" battalions); the First Greek Army, consisting of three army corps (10 divisions) and two "Honest John" battalions; the First Turkish Army, consisting of three army corps (nine divisions) and two "Honest John" battalions; the Fifth and Sixth Tactical Aviation Commands and the British Mediterranean air forces (1,226 aircraft in all) and the US Sixth Strike Fleet.

The concept and course of the maneuvers confirm the previously held view that the NATO command considers the Central European Theater of Military Operations as the theater of paramount importance. It is here that the main forces of the bloc are deployed, the overwhelming part of the means of mass destruction are used and the solution of the basic tasks of a future war is contemplated. For this reason the NATO command has devoted great attention to the preparation

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

of this theater and has created in it the necessary supplies of materiel for the conduct of a war. In the plans of NATO the Southern European Theater and, even more so, the Northern European Theater, occupy a secondary place.

The "FALLEX-60" maneuvers show once more that the aggressive bloc of imperialistic nations base all their calculations for the attainment of the goals of a future war on the mass use of nuclear weapons. In these maneuvers, as in others, the basis for the operations of the various branches of armed forces was the so-called nuclear attack. It was carried out with the goal of gaining nuclear superiority and seizing the strategic initiative from the first days of the war. In the course of this attack the following tasks were worked out: destruction of the enemy's nuclear weapons and means for employing them (aircraft and missiles); disruption of a possible "Orange" attack; destruction of groupings of ground troops; disorganization of troop control; interdiction of the approach march of reserves by creating obstruction zones; and destruction of communication routes.

The first nuclear strikes (in NATO terminology the counterstrike) were launched 14 minutes after the beginning of a war supposedly unleashed by "Orange". However, 15 minutes before the start of the war, almost all the tactical and strategic aircraft were airborne, and the missile units and nuclear artillery had been brought to complete readiness. Therefore, part of the "Orange"nuclear strikes were launched against vacant places. In this way the NATO leaders wished to show that their intelligence has the most precise information.

For the launching of the nuclear strikes the following were involved: 200 strategic bombers (approximately); 820 aircraft of tactical and carrier aviation (approximately 50 percent of the tactical bombers and fighter-bombers are delivery aircraft for nuclear weapons); 60 "Thor" intermediate range missile launchers, which were being used in exercises for the first time; 30 "Mace" and "Matador" cruise missile (samolet-snaryad) launchers; and 55 battalions of tactical missiles and atomic artillery.

All tasks of the nuclear attack, according to the calculations of the NATO command, were fulfilled in 60 hours. It should be noted that in past exercises the fulfilment of such tasks took 72 hours. The depth of the strikes reached 1,000 km and more. According to incomplete data

[redacted] 1.3(a)(4)

[redacted]

1.3(a)(4)

there were launched in all approximately 1,660 nuclear strikes, including more than 210 in the Northern European Theater, about 1,100 in the Central European Theater and 350 in the Southern European Theater. In comparison with earlier exercises an increase can be noted in the number of nuclear strikes, especially in the first twenty-four hours.

More than 2,000 aircraft actually took part in flights. The light bombers launched strikes one at a time at intervals of 15 to 20 minutes. The enemy antiair defense was breached at high altitudes. For training purposes they made the run over the objectives not less than twice from various directions. Fighters launched nuclear strikes from altitudes of from 11,200 to 11,800 meters, either singly or in pairs, and to a depth of 1,000 km and more. The flight to the targets was accomplished at medium and low altitudes. Great attention was devoted to the launching of nuclear strikes with the aid of surface radar systems to direct fighters to the target from great altitudes and at distances up to 260 km.

The strategic aviation of the US, intended for the conduct of the "Counter Actions" operations and the strategic aviation of Great Britain did not actually participate in the flights. The subunits of American strategic bombers were in a state of increased combat readiness at air bases in Great Britain, Spain and Morocco. From the American bases located in Great Britain nine bombers in all actually sortied. The flight course passed over the Bay of Biscay, Spain, the Balearic Islands, Sardinia and France. The flight was carried out by groups of three aircraft each at altitudes of 9,000 to 10,000 meters and with 30-minute intervals between groups and one-minute intervals between aircraft in a group. The aircraft approached the targets by different routes, and released their bombs from altitudes of 11,000 to 11,500 meters. Each crew was assigned one basic and two or three alternate targets.

Special attention was paid in the maneuvers to the problems of the organization and support of the nuclear attack. According to calculations of the NATO command the basic goals of the nuclear attack for the destruction of the enemy's groupings and his military-economic potential were attained. The operations of strategic aviation and

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted] 1.3(a)(4)

of the "Thor" missile units were declared to be especially effective.

It is obvious that the nuclear strikes planned by the NATO command can cause enormous damage to our country and armed forces unless measures are adopted to disrupt these strikes. The possibilities for disrupting such strikes are quite real. The main body of delivery vehicles for nuclear weapons consists basically of strategic, tactical and carrier aircraft, as well as cruise missiles. It has once again been confirmed that up to this time the USA and its allies are considerably behind the USSR in the development of missiles, especially those of strategic import.

Inasmuch as the basic means of nuclear attack is aviation, it is not difficult to reach the conclusion that it is necessary to combat it in the air with PVO forces and also to destroy it on the airfields.

In the first stage of the maneuvers the ground troops worked on problems of defense with the aim of screening the areas where the nuclear means are based and of holding the line for the subsequent offensive.

The main forces in the Central European Theater were deployed on the line Hamburg, Bremen, Felsberg, Bamberg, Regensburg, east of Munich, at a distance of 50 to 130 km from the borders of the GDR and Czechoslovakia. The screening forces and reconnaissance were operating forward.. The majority of the divisions were linearly deployed on the main line. In reserve were four divisions in all (out of 25). On the average a division was allotted 23 km in the sector of the Northern Army Group and 35 km in the sector of the Central Army Group. The main task assigned to the troops of the first echelon was to hold the forward line for at least 48 hours, i.e., the time the NATO command calculates is needed for accomplishing the main tasks of the nuclear attack.

During the course of the defensive engagement, groupings of ground troops were created for the subsequent transition to the attack along the main axes. For the Northern Army Group these groupings in the zones of the offensive comprised

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

West German and British army corps, and for the Central Army Group, the Third West German Army Corps and the Seventh US Army Corps. The reserves moving up from the rear area were intended for use in the offensive. It is clear that the NATO command hopes that in the course of the nuclear attack the enemy will sustain such destruction that the ground troops will be able to go over to the attack along these axes.

The defense of Turkey and Greece was organized along the international boundaries.

In this exercise, "Orange" had taken the offensive along all axes from the first days of the war. The rules of the course of combat operations were so drawn that, in the first three days in the Central European Theater, "Orange" achieved quite insignificant success. Only on individual axes were they able to drive a wedge 25 to 35 km into the forward line of the NATO troops. By the end of D plus 7 "Orange" had pressed back the NATO troops to a depth of 200 km, and their average rate of advance was 10 to 20 km per day. Here the "Orange" attack was checked.

In the Balkans the "Orange" forces advanced 60 to 120 km in the first three days, and were forced to go over to the defensive. Here the average rate of advance reached 25 to 35 km per day.

In the opinion of the directors of the exercise, by D plus 8 "Orange" suffered considerable losses: in aviation 80 to 85 percent, in personnel 30 to 60 percent. NATO troop casualties in comparison with those of "Orange" were manifestly lower. Not one of their divisions was put out of action, and up to the eighth day of the war their troops retained a higher combat effectiveness than those of "Orange". The troops of both sides conducted combat operations with their large units, taking into account losses from nuclear strikes. It should be noted that in the course of defensive operations provision was made for maneuvering by forces and weapons and for the launching by them of counterattacks.

Thus the exercise "FLASH BACK-1" shows that the NATO command counts on the mass use of nuclear weapons in the first days of a war to disrupt the enemy attack, to preserve

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

their own forces, and to ensure that they will be able to go over to a determined offensive following the nuclear strikes.

Combat operations in ground theaters were played out in a similar way even in earlier exercises, particularly exercise "SIDE STEP" (1959). It is obvious that such a version of combat operations has been foreseen in NATO plans.

There are weaknesses in this plan, which must be taken into account. All calculations of the NATO command are based on the use of nuclear weapons. If the nuclear strikes can be disrupted or weakened to a significant degree at the beginning of a war (and such a possibility exists), then favorable conditions will be created for carrying out an attack with decisive goals. In the screening zone the NATO troops will not be able to offer any serious opposition to the attacking large units. NATO groupings on the main line can be crushed by nuclear strikes even before the attacking troops reach them. In the troop formations on this line there will be gaps measured in hundreds of kilometers. The "patchwork" composition of the divisions (made up of the troops of various nations) also does not contribute to the steadfastness of the troops. If all this is considered, then the conclusion is inevitable that the optimism of the NATO command, as revealed by the "FALLEX-60" maneuvers, is, putting it mildly, ill-founded.

Deserving of serious attention is the naval Exercise "SWORD THRUST-1", which was carried out in the first stage of the maneuvers by the forces of the US and British strike fleet in the Norwegian Sea. Here there were deployed the US Second Fleet and a British fleet, which were composed of four strike carriers, one heavy carrier for antisubmarine defense (PLO), two cruisers armed with missiles, two light cruisers, 12 submarines (including two atom-powered submarines), and 300 carrier aircraft. The fleet began to move into this area on 6 September. Two days before the beginning of military operations, the operational buildup of the fleet was complete, and in seven hours it occupied a maneuvering area in the central portion of the Norwegian Sea, from which it was supposed to launch nuclear strikes.

The fleet was to launch nuclear strikes against 183 targets. Carrier aircraft completed one sortie per day,

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

and launched strikes to a depth of up to 1,100 miles. The strikes were launched mainly by single aircraft and in daylight hours. The plan of nuclear strikes was fulfilled, according to calculations of the leadership of the exercise, in 36 hours. This is a very important circumstance. In past exercises it usually took 72 hours. The decrease in the time for launching the planned nuclear strikes was attained by increasing the quantity of means used for this purpose and in maximum exertion of them. It is evident that the NATO command considers that carrier aviation can operate more successfully even in comparison with tactical aviation. No special differences in the methods of operations of deck-based attack aircraft in comparison with strategic and tactical aviation were noted in this exercise.

The formation of the naval forces in the maneuvering area deserves notice. The fleet consisted of two operational strike groups: the American (two strike carriers with 160 aircraft) and the British (two strike carriers with 100 aircraft), which were drawn up at a distance of 45 to 90 miles from each other. In the center of each group were located the strike carriers, with intervals of 20 to 60 miles. Around the strike carriers at a distance of up to 60 miles were located the forces of the antisubmarine and antiair defense. Air cover was provided by deck-based fighters, which patrolled in the air in two tiers, with groups of two aircraft each, and with the groups at intervals of 15 to 60 miles from one another. At a distance of 120 to 150 miles the aircraft, submarines, and destroyers of the radar patrol were operating.

Thus, two operational groups of the fleet were located in an area measuring approximately 100 x 200 miles, or, if we include the elements of the radar patrol, 165 x 270 miles. This area was saturated with a large number of warships of various types. The forces of the Sixth Fleet, operating in the Mediterranean Sea, had approximately the same formation in the maneuvering area. In fact this fleet was drawn up somewhat more compactly.

In the formation of the forces of the NATO strike fleet in the maneuver area there were a number of weaknesses, which must be noted in order to organize measures for combating them. If the radar patrol elements are destroyed or neutralized, then the local security forces will not be able to defend the

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

strike carriers successfully from strikes by long-range bombers armed with the K-10 or, especially, the K-20, or from submarines armed with the new missiles. The operational groups are in the maneuvering area for 36 hours, which facilitates combat against them. It is important only to make a prompt determination of the maneuver area in order to establish the position of the attack carriers in the combat formation and to ensure the guiding to them of our own strike forces. One must also take into account the vulnerability of attack aviation to modern means of antiair defense. In a word, there are substantial possibilities for disrupting nuclear strikes launched by the forces of the carrier fleet of the NATO bloc. After fulfilling the task, the fleet withdrew to the Iceland area to take on supplies. The vulnerability of the strike fleet is increased even more during this passage, and especially in the area where supplies are taken on.

These are the most important exercises of the first stage of the "FALLEX-60" maneuvers.

* * *

The situation created for the start of the second stage of the maneuvers is marked by a broadening of the scope of military operations. Austria has been occupied (supposedly by "Orange"). Yugoslavia has suffered an attack by "Orange" and has entered the war on the side of NATO. Spain is ready to enter the war. The situation has become aggravated in North Africa, the Middle East and Indochina, and on the border of the Chinese People's Republic and Nepal. Thus, according to NATO calculations, a new world war must break out. The directors of the maneuvers strove in every way to shift the entire responsibility for the broadening of military operations onto the Socialist nations. But behind this clumsy camouflage it is not difficult to see the true aggressive plans of the imperialists for fanning the flame of world war. Even at the very beginning of the war they did not hesitate to violate Austria's neutrality. The maneuvers show that in case of war the NATO command intends to use Yugoslavia on their side. The aggressive imperialist circles consider that even at the beginning of a war they will succeed in spreading military operations to Africa, the Near and Middle East and to Southeast Asia, so as to revitalize or strengthen their domination in these areas.

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

In the course of the games at the beginning of the second stage, which corresponded to the eleventh day of war, both sides had suffered considerable losses, and there had been formed large zones of destruction and high levels of radioactive contamination. The NATO armed forces, however, maintained nuclear superiority and achieved supremacy in the air, mainly with carrier aviation. As for the "Orange" forces, their attack was broken up and their stocks of nuclear weapons were exhausted (or else they were holding them back). The NATO troops therefore went over to the counterattack. This constituted the main feature of the second stage of the "FALLEX-60" maneuvers.

Exercises "FLASH BACK-2" and "HOLDFAST" were held in order to work out problems of the counterattack (cf. Fig. 2). The NATO troops went over to the counterattack in the Central European Theater and in the Balkans. In Italy the defensive operations continued.

Reliance on nuclear weapons as the basic means of conducting a war was also reflected during the second stage of the maneuvers. At the beginning of the counterattack, an additional allocation of nuclear weapons was provided for, especially for the troops operating in the Central European Theater. Support of the ground troops was switched over to the carrier strike large unit employing its nuclear weapons. Provision was made for nuclear preparations for the counterattack, for the destruction of the enemy's remaining nuclear and air potential, and for the creation of obstacles on his lines of communications, with the goal of interdicting the moving up of reserves and delivery of material. These were the tasks set for the direct support of the attacking troops by nuclear strikes.

There is some information on the reinforcement of the groupings of ground troops in the Central European Theater. At the beginning of the counterattack here there was an additional deployment of 10 divisions: three French divisions were transferred from Africa, one division was transferred from Great Britain, four divisions were mobilized in France, and one division each in Belgium and Holland.

The main goal of the counterattack was to complete the defeat of the enemy's troop groupings in the theaters, to

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

restore the position on the front and to create conditions for the seizure of the GDR, Czechoslovakia, Poland and Hungary and for the transfer of military operations to the territory of the USSR. The plan made provision for the launching of strikes by groupings of ground troops to a considerable depth. In the area of the Northern Army Group the basic mission was carried out by West German and British army corps, and in the area of the Central Army Group by American and West German army corps. The main forces were concentrated on the Berlin and Dresden axes. On the Balkan Peninsula the main strike was carried out by the Turkish army.

The troops went over to the counterattack on the Balkan Peninsula on the eleventh day of the war, and in the Central European Theater on the thirteenth day of the war.

In the course of the exercise the counterattack in the Central European Theater was completely "successful". By 1400 hours on the fifteenth day the position along the whole front had already been restored, and the NATO troops were advancing at a rate of 70 km per day (we should remember that the "Orange" forces had advanced at a rate of 10 to 20 km per day). An invasion of the territory of the GDR was further contemplated, but this was not played out in the exercises.

The counterattack in the Balkans likewise developed "successfully". The First Turkish Army advanced at a rate of 35 km and the First Greek Army at 25 to 30 km, per day. In the area of Alexandropolis an amphibious landing was played out (two divisions).

Among the groupings of ground troops in the Central European Theater the first place in number of divisions involved belonged to the Federal German Republic. This demonstrates the ever-growing role of West Germany in NATO. Also in partial testimony to this is the fact that in the maneuvers there was created a West German armed forces high command, which, in comparison with the other participants in the exercises, tried to occupy a more independent position from the NATO command.

The leadership of the Bundeswehr strove during the maneuvers to have the FRG troops operate on the main axes,

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

and in this they were successful. In comparison with past exercises the West German command in the "FALLEX-60" maneuvers exerted a considerably greater influence on the adoption of solutions for the operation, in the selection of targets for nuclear strikes, and on the direction of troops in the course of military operations. As an example, one West German army corps was assigned the task of securing the flanks of the NATO armed forces from the direction of the Bavarian-Czech and Austrian borders. The Bundeswehr command did not agree with this task. It employed the main forces of the corps for an attack on the main axis, and for covering the flanks of the whole grouping it allotted only a part of the forces. We must note that the American command did not oppose such pretensions of the West German revanchists, but encouraged them in every way.

The Bundeswehr general staff in its conclusions on the maneuvers emphasized above all that the FRG troops ought to be used on the axis of the main strike of the NATO combined armed forces, and for this reason in comparison with the other allies, they should be best supplied with personnel and material-technical means.

The Bundeswehr general staff does not rely on the ability of the USA to support NATO troops with the necessary materiel means in the course of a war, and therefore raises the question of advance creation of stockpiles in peacetime. With this goal the FRG has created in Western Europe its own bases, and also wishes to transform them in advance into its rear area in case of war. In the conclusions on the maneuvers it was also mentioned that the headquarters involved in the exercises were cumbersome and insufficiently mobile, that the means of automation, the television apparatus and other technical means of control were not suitable for field conditions. Obviously, the West German military will adopt measures to eliminate this important, in their opinion, shortcoming.

The Bundeswehr leaders also note that the military preparedness of the FRG is inadequate, that its military potential is still low and that there has still not been created in the FRG either the moral or the economic or legal prerequisites which would permit the Bundeswehr to "defend" itself, along with the troops of the other member nations of NATO which are located on the territory of West Germany. It is clear that what is meant is the activation

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

of the military preparations of the West German revanchists, the strengthening of the Bundeswehr and its transformation into the basic striking force of NATO, which would furnish them at any favorable moment with the possibility of realizing their predatory plans which are directed against the Socialist countries. These plans and actions of the West German revanchists demand the most acute attention from our side.

The naval exercise "SWORD THRUST-2" was conducted with the goal of working out the support by carrier strike large units of the operations of ground troops in the Central European Theater. The NATO command obviously considers that tactical aviation at the present time may sustain heavy losses, as a result of which it is not in a position to give effective support to the operations of ground troops. Carrier aviation, on the other hand, can maintain its combat effectiveness, and therefore it is advisable to switch to it for the support of ground troops during military operations.

In the Bay of Biscay was deployed the large operational strike unit which had accomplished the maneuver from the Norwegian Sea. This large unit consisted of two strike carriers, a heavy carrier for antisubmarine defense, two cruisers armed with missiles, four submarines and more than 150 aircraft. During the course of the counterattack the carrier large unit played out 155 nuclear strikes in the Central European Theater.

* * *

In addition to those mentioned, a considerable number of other exercises were conducted in the course of the "FALLEX-60" maneuvers.

On the Jutland Peninsula there took place a two-sided troop exercise, "STUBBORN DEFENSE". On the defending side were two divisions (FRG and Denmark) and on the attacking side a British division and parachute brigade. Simultaneously with these, exercise "BONE DRY" was conducted in the Baltic Sea to work out the combat operations of the navy of the FRG and Denmark for cooperation with ground troops in an actual amphibious landing in the area of the straits of the Baltic Sea.

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

At the same time two exercises were conducted on the territory of Norway and in the northeast section of the Norwegian Sea ("COOL TIME" and "SWORD THRUST-2") with the participation of Norwegian troops and a British carrier strike large unit. In these exercises were worked out antilanding defense and support of ground troops by a carrier strike large unit.

Exercise "BLUE SHIELD", which was conducted in the area of Iceland and the Faeroe and Shetland Islands, is deserving of serious attention. Its main goal was to work out antisubmarine defense. Involved in the exercise were 17 submarines and 50 coastal-based antisubmarine aircraft. These forces operated along an antisubmarine line with a depth of 350 to 400 miles with the mission of preventing "Orange" submarines from breaking out into the Atlantic Ocean. In the center of the line, deployed in positions, were eight antisubmarine submarines. For the aviation patrol zones were designated, in which three to five aircraft operated continuously. Each aircraft was in the air an average of 10 to 12 hours.

A considerable number of exercises were held to work out the protection of naval lines of communication: exercise "FIRST and SECOND WATCH" in the area of the English Channel, the Central Atlantic and the Bay of Biscay; "TIGER GRIS 1 and 2" in the southern part of the North Sea; "PROTECTION 1 and 2" in the Mediterranean; "BALLAST" and "COFFERDAM" in the area of the Azores and the Straits of Gibraltar. In the first stage of these exercises were worked out the dispersal of ships and warships, and their evacuation together with the withdrawal of a considerable number of ships to bases on the US coast. In the second stage problems were worked out of guaranteeing naval lines of communication and of escorting convoys and single ships. Up to 40 convoys were actually conducted, each convoy consisting of two to four ships plus security forces. Considerable naval and air forces were involved in securing lines of communication. All these exercises demonstrate that the NATO command attaches great significance to the protection of its sea lines of communication, especially in the Central and Eastern Atlantic and in the area of the English Channel and the Straits of Gibraltar.

1.3(a)(4)

[redacted]

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

Simultaneously with the "FALLEX-60" maneuvers, and against their operational-strategic background, the US Air Force carried out two exercises for strategic aviation and for the combined air defense command of the North American continent under the provisional code names "SEPTEMBER-1" and "GREAT EFFORTS".

In the first exercise, which was conducted in the continental USA from 20 to 23 September, operations were worked out for strategic aviation in the first air operation of the initial period of a war, in cooperation with the nuclear attack of the NATO armed forces. According to the concept of the exercise, strikes were launched against rear area objectives of our country.

The second exercise with the participation of this type of aviation took place in the northern and Arctic areas of the USA and Canada from 28 to 30 September, i.e., at the beginning of the counterattack in the Central European and Southern European Theaters. As a result of the operation the strategic aviation inflicted great damage on the "Orange" forces, but exact data on this have not been brought out. The directors of the maneuvers are in agreement that the military command of the US did not have precise information on the results of the strikes of strategic aviation. Despite this it was acknowledged that it was necessary to carry out a further operation involving the launching of nuclear strikes against rear area "Orange" objectives by the forces of strategic aviation.

* * *

A brief analysis of the "FALLEX-60" maneuvers permits us to draw the following basic conclusions.

The "FALLEX-60" maneuvers were a vast training measure of the aggressive NATO bloc, in which were worked out problems of the conduct of war by the bloc against the USSR and other Socialist countries. Essentially all the armed forces of the NATO bloc, all the organs of military control, and a considerable number of civilian agencies were brought to increased combat readiness for the organization of the maneuvers.

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted]

1.3(e)(4)

The maneuvers were conducted under a single strategic concept, they embraced all the main theaters of military operations, and envisaged employing the forces and means at the disposal of the bloc with a strongly centralized leadership. In the maneuvers as a whole were worked out the basic problems of conducting military operations on a strategic scale. Actually participating in them were considerable forces of aviation, the navy, ground troops and the forces and means of antiair defense, all of which supported the working out of the methods of conducting military operations and of the problems of cooperation of the various arms of forces of the NATO member nations. All this testifies to the fact that the NATO military leadership is striving to find the most effective methods for preparing their armed forces and organs of control and for increasing their combat readiness in order to achieve definite superiority of the NATO armed forces over the armed forces of the Socialist nations. This must not be underestimated.

The maneuvers testify above all to the fact that the NATO command is ready to begin a war with the forces which have already been formed in peacetime, in order in this way to camouflage a sudden attack on the Soviet Union and the other countries of the Socialist Camp. In addition, the NATO leadership, as before, is relying on a powerful strike with nuclear weapons in order to create superiority in forces and means and to seize the strategic initiative from the very beginning of military operations.

The maneuvers also demonstrated that the basic strategic and operational-tactical tasks will be accomplished by all the previously existing branches of the armed forces and arms of troops. From this it follows that modern war requires mass armies.

Despite the large scale of the maneuvers, they did not introduce anything essentially new to the theory of the military art of the imperialist powers. The maneuvers were only a confirmation of earlier established views on the conduct of war. Such an important problem as the creation of superiority of forces is solved by an old method - by increasing the number and power of fire strikes. The fact that aviation constituted the main striking force in

[redacted]

1.3(e)(4)

[redacted]

1.3(a)(4)

[redacted] 1.3(a)(4)

the maneuvers did not permit a full exposition as to how they will solve the problem of cooperation between missile units and aviation.

A typical feature of the maneuvers was an increase in the tempo of the offensive, which can be explained by the mass use of nuclear weapons.

For this reason the conduct of the so-called nuclear offensive is deserving of very acute attention, as carried out by the forces of strategic, tactical, and carrier aviation and by missile units.

Despite the use by the directors of the maneuvers of such terms as "counterblow", "defense", "counterattack", etc., documents on the maneuvers show distinctly that the military doctrine of the NATO bloc has an aggressive, offensive character and that the bloc command are supporters of the pre-emptive strike.

SUBJECT : MILITARY THOUGHT (TOP SECRET): "The Question of the Organization of the Organs of Troop Control", by Major-General N. Reut

DATE OF INFO: October 1961

APPRAISAL OF CONTENT : Documentary

SOURCE : A reliable source (B).

Following is a verbatim translation of an article titled "The Question of the Organization of the Organs of Troop Control", written by Major-General N. Reut.

This article appeared in the 1961 Fourth Issue of a special version of the Soviet military journal Voyennaya Mysl (Military Thought). This journal is published irregularly and is classified TOP SECRET by the Soviets. The 1961 Fourth Issue went to press on 20 October 1961.

Headquarters Comment: The articles cited on page 2 were disseminated as follows: M. Ivanov [redacted] A. Morozov, N. Lyashchenko, and V. Arkhipov [redacted] K. Pasbuk [redacted] 1.3(a)(4)

"Military Thought" is published by the USSR Ministry of Defense in three versions, classified RESTRICTED, SECRET, and TOP SECRET. The RESTRICTED version has been issued monthly since 1937, while the other two versions are issued irregularly. The TOP SECRET version was initiated in early 1960. By the end of 1961, 61 issues of the SECRET version had been published, 6 of them during 1961.

The Question of the Organization of the Organs of Troop Control

by

Major-General N. Reut

The necessity has long been apparent for discussing the problems involved in improving the system of troop control (upravleniye voyskami) and the administrative-organizational structure of the control organs. It is known that the existing organs of control are unwieldy, insufficiently flexible, and do not ensure the mobility necessary for control of troops during abrupt changes in the situation and in keeping with the highly maneuverable nature of combat operations.

The articles of Generals M. Ivanov, A. Morozov, V. Arkhipov, and Colonel K. Pashuk, basically, correctly uncover the flaws in the existing organizational structure of control organs, and the inability of the latter to ensure firm control of troops. However, a significant portion of these authors' proposals for improving the organization of the control organs is directed, actually, toward slightly modernizing the organizational structure and adapting it to modern requirements. In our opinion, such an approach cannot lead to the eradication of the flaws in the organization of troop control uncovered by the authors.

In the existing structure, as well as in the structure of the control organs proposed by the authors, there are still a few organs, acting parallel to one another, and directly subordinate to the combined-arms commander, among which the functions of troop control are divided. The combined-arms staff and the numerous commanders of arms of troops (special troops) and services are such organs now. In General M. Ivanov's proposals, the control functions are divided between a main planning center, operations, intelligence, and nuclear/missile centers, and a PVO control center. The other authors are for maintaining the apparatus of the commanders of arms of troops (special troops) and services, and by so doing, concur in the existence of numerous control organs.

Indeed, this "overgrowth" of the combined-arms commanders by control organs operating along parallel lines is the very thing which brought about loss of flexibility, since it has forced them to spend much time and

[redacted] 1.3(a)(4)

[redacted]

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

IRONBARK

[redacted] 1.3(a)(4)

energy directing the activities of a large number of directly subordinate officials heading the specific control organs.

In our opinion, in order to eradicate the flaw noted, it is necessary to have only one organ of troop control, directly subordinate to the combined-arms commander. Such an organ should be a staff, since only the latter is capable of evaluating a situation thoroughly and objectively, determining the combat capabilities of friendly troops and the troops of the enemy, proposing to the combined-arms commander an expedient solution to the problem posed, determining the forces and weapons needed for it, and also, quickly coordinating the efforts of the large units and units. This will permit the combined-arms commander to spend a minimum of time adopting well-founded decisions. The other organs -- commanders of arms of troops (special troops) and services, and their apparatus, can be abolished, because they only complicate the process of troop control by their autonomous existence, and have actually lost the role which they played in the years of World War II and after its termination. During the course of training, many commanders of arms of troops (special troops) are found to be hostile to troop control and, to a certain extent, are a burden to the control points.

It is known that in order to perform operational tasks in the course of a modern operation, the combined-arms commander allots a specific quantity of forces and weapons, including combined-arms large units (units) and units of arms of troops (special troops). Each one of such groupings is headed by a subordinate combined-arms commander and is designated for operating on a separate axis and for making independent decisions regarding the tasks confronting him (using, of course, the results of strikes by weapons of mass destruction, if they are delivered by the senior commander).

Each combined-arms commander who leads such a grouping of troops is given the right of independent command of the forces and means assigned to his jurisdiction, and is charged with most effective use of them in performing the assigned tasks. In this case, it becomes superfluous to have supervision from above; this often arises because of the tendency of the commanders of arms of troops (special troops) and services to plan operations and issue orders about the manner of using the units and subunits which are within their competence, but which are subordinate to the lower-ranking combined-arms commander.

[redacted] 1.3(a)(4)

[redacted]

[redacted] 1.3(a)(4)

It is the removal of this supervision which creates favorable conditions for the combined-arms commander to practice intelligent initiative and make best use of forces and means in a situation which arises.

It is also known that each combined-arms commander keeps a certain quantity of the means of destruction under direct subordination to him (large units and units of missile troops, aviation, and anti-aircraft missile units); these allow him to exert decisive influence on the course and outcome of combat operations, creates reserves for reinforcing the main troop groupings, and for performing unexpected or suddenly arising tasks; finally, he also has units (large units) of special troops, which he designates for the execution of the most vital measures in the interests of supporting the operations of all the troops in the formation.

Thus, during the course of the operation, the combined-arms commander must direct the lower-ranking combined-arms commanding officers who head up the groupings of troops designated to execute independent tasks on separate axes; he also directs the above-mentioned means of destruction, reserves, and units (large units) of special troops left under his direct subordination. What role, in troop control, then, in these circumstances, will be played by the commanders of the arms of troops and special troops?

Recently it has been recognized that there is need for wide use of nuclear weapons and other means of mass destruction in an operation; the firing capabilities of the units (subunits) having these means have been increased, as have the ranges of fire, and the need has arisen to increase the speed of delivery or retargeting of fire strikes against the enemy. All this substantially influences the use of means of destruction in a modern operation. In our opinion, it is necessary to change the organization of the control of these means, because it no longer ensures fast delivery of fire strikes, and does not correspond with the new principles of assignment of missions by the combined-arms commander.

Actually during World War II and after its termination, the combined-arms commander designated only tactical tasks for the means of destruction, and in this connection there was need for control organs for these means. These organs were occupied with determining the fire tasks and distributing them among the numerous artillery groups (units, subunits), planned

[redacted] 1.3(a)(4)

[redacted]

[redacted] 1.3(a)(4)

the execution of these tasks, and also organized the control of the most effective massed artillery fire, which called for bringing in many artillery units which were subordinate to various levels of command. This justified the interference of the commander of artillery of the operational formation (combined-arms large unit) with the operations of the lower-ranking combined-arms commanders, and the bringing in of the artillery units subordinate to them for carrying out massed fire on behalf of the operational formation (combined-arms large unit) as a whole.

In addition, these organs of control were charged with organizing reconnaissance of the enemy's system of fire and carrying out combat with his main means of destruction -- artillery and mortars. All this taken together permitted the commander and staff of the artillery of the operational formation (combined-arms large unit) to resolve independently the particular sphere of problems connected with the combat activities of the artillery and, as a result, the above-mentioned control organs were quite necessary.

In modern operations the combined-arms commander assigns not tactical, but actual fire tasks to the missile troops, indicating the objectives to be destroyed by nuclear (chemical) warheads, the yield and quantity of the latter, the time for delivering nuclear strikes, and the type of burst. In other words, at present the combined-arms commander is charged with the planning of fire, which is closely related to planning the operations of troops. It therefore follows that the combined-arms commander no longer has any need for those organs which would be occupied specifically with the planning of fire, and there is no need to duplicate his work and the work of the combined-arms staff.

At the same time, under modern conditions, the basis of the combat formation of the enemy -- his nuclear means -- can be discovered only by the combined efforts of all types of intelligence. In turn, the destruction (limiting the operations) of nuclear means of the enemy is also attained by the coordinated efforts of missile troops, aviation, PVO troops, and radio countermeasures, in conjunction with a swift offensive by the combined-arms large units and units. As a result, the organization of intelligence and combat with the nuclear means of the enemy can only be in the hands of the combined-arms commander. It follows, therefore, that the combined-arms commander has now become the organizer of combat with the enemy's principal means of destruction, and not the commander of missile troops and artillery, as many think.

[redacted] 1.3(a)(4)

[redacted]

[redacted] 1.3(a)(4)

Everything which has been said, in our opinion, deprives the commander of missile troops and artillery of independence of action, and turns him into a direct executor of fire tasks, which are specified by the combined-arms commander, and limits his activity to the control of the units of missile troops and artillery left directly subordinate to the combined-arms commander.

In connection with this there arises the question of whether it is advisable to remove the commanders of missile troops and artillery and their staffs from the commands of operational formations, and to turn over to them the command of the missile and artillery units which are directly subordinate to the combined-arms commander. This will increase their responsibility for the status of the units directly subordinate to them, and will permit them to exercise full command of the latter; it will also eliminate the possibility of interference with the operations of the lower-ranking combined-arms commanders.

The fast-moving nature of combat operations, and the need for rapidly delivered strikes by nuclear and chemical weapons require immediate transmission of the fire tasks to the executors. This can be attained to the best degree by direct communications between the combined-arms commander and the executor, i.e., the commanding officer of the missile or aviation unit (subunit) directly delivering these strikes. However, an excessive number of such executors complicates the activity of the combined-arms commander in controlling them, and necessitates intermediate organs capable of ensuring firm control.

Under the existing administrative-organizational structure of the control organs, there are, between the combined-arms commander and the executor -- the commanding officer of the missile or aviation subunit -- three intervening relay organs. In the missile troops, these include the commanding officer of the missile troops and artillery, the commanding officer of the missile brigade, and the commanders of battalions; in aviation, there are the commander of the air army and the commanders of aviation divisions and regiments. In our opinion, it would be advisable to abolish the brigade level in the missile troops and the divisional level in aviation, because there is no independent use for them during the course of combat operations. This step will significantly speed up the process of troop control, cut down on the quantity of documents to be processed, and lower expenditures on the maintenance of the control organs.

The conditions under which a modern operation is conducted, and control of troops during its course evoke the need for review of the organization of control of the means designated for combating the air enemy, because the current subordination of these means to two commanders -- the commander of the air army and the commander of PVO troops -- does not ensure unity of command, nor their effective utilization. The need arises for the combined-arms commander to coordinate directly the operations of these two levels, which leads to an unwarranted waste of time, which is so precious during the course of combat with the highly mobile air enemy.

Perfecting the ground means of combat with the air enemy, and increasing the combat capabilities of antiaircraft missile units, allow for creating zones of continuous destruction along the entire area of operations of the troops of a front. In their turn, such zones ensure centralized use, on the scope of a front, not only of the fighter aviation, but of antiaircraft missile units, as well as the means for reconnaissance of the air enemy, and radio countermeasures, all under the direction of a single control organ.

In this connection, we suggest that antiaircraft missile units be taken out of the makeup of combined-arms large units and the primary operational formations, in order that they may be used in a centralized and more effective manner on the scope of a front. In this way there will be no need for coordinating the combat operations of aviation with the numerous levels of command to which antiaircraft missile units are subordinate, and it will become possible to use them more effectively for destroying the air enemy.

As suggested by us, shifting antiaircraft missile units to subordination to a single control organ of the front will permit painless elimination of the intervening control organs -- the chiefs of PVO of the combined-arms large units and the primary operational formations, which, at these levels, have almost no bearing on the course of combat in the air; it will also eliminate preparation of unnecessary documents.

Such a measure will free the commanders of troops of the primary operational formations (commanding officers of combined-arms large units) from organizing the combat with the air enemy, a subject to which they actually attach little significance, since the main thing to them is the defeat of the enemy's ground troops.

[redacted] 1.3(a)(4)

It is advisable to assign the control of all the means designated for the destruction of the air enemy to the commander who controls the means of air attack. Such a situation is conditioned by the fact that, in the first place, this commander can organize the combat with the air enemy more easily, not only in the air, but on the ground, and in the second place, he can coordinate more promptly the operations of fighter aviation and antiaircraft missile units with the operations of his own means of air attack.

Taking all this into consideration, it occurs to us that it would be beneficial to combine the means of PVO and aviation under the unified leadership of the commander of the air army. This will do away with duplication in the work of the chief of PVO troops of a front and the commander of the air army, and with unnecessary coordination, and will free the combined-arms commander from still another artificially created organ of control -- the PVO command post; the use of the latter in the course of an operation, in the light of the control system suggested by us, is highly questionable.

For combat with low-flying aircraft and cruise missiles, as well as for the destruction of the enemy's army aviation aircraft, it would be expedient for combined-arms large units and units to have appropriate antiaircraft weapons, which would be equally suitable for combat with the ground enemy. It is the versatility of these weapons which will permit effective employment of personnel in the course of a battle to combat the air or ground enemy, depending on the actual situation which has developed. The combined-arms commander can control such units (subunits) directly, without the help of the chief of PVO troops and his apparatus.

Uniting the missile and aviation means of destruction under a single organ -- a missile/nuclear center -- as is suggested by Major-General M. Ivanov, considering the clear-cut technical isolation which exists between the types of armament, is hardly advisable, because such an organ will be incapable of directing simultaneously the operations of the missile units and aviation, and especially of supporting them from the technical aspect.

The use of units (large units) of special troops and the organization of their control differ somewhat at the present time from the analogous situation during World War II. Specifically, the increased independence in operations of the combined-arms commanding officers has made superfluous the interference of the chiefs of the special troops attached to the higher

combined-arms chief in the use of units within their competence which have been resubordinated to the command of lower-ranking combined-arms commanders. In this connection there is no need to accomplish, at the higher level, the planning of various measures of support for operations of subordinate troops, to be executed by special units directly subordinate to the lower-ranking combined-arms commanders, since this problem can best be handled by the troops themselves. Freeing the chiefs of the special troops from these functions will allow them to spend more time on measures which the combined-arms commander expects to accomplish by the units of special troops left under his direct subordination, on behalf of all the troops subordinate to the formation (large unit).

Under these conditions, the combined-arms commander needs organs for controlling the units of special troops which were left under his direct subordination. In our opinion, this role will be filled best by the chiefs of special troops, which have become commanding officers of composite large units of special troops; they will gain independence of action, will have their own control points, and will be able to make decisions in order to perform the tasks assigned by the combined-arms commander. There will be no need for the chiefs of special troops to remain at the control point of the combined-arms commanding officer, and this will greatly increase the flexibility of this point.

Outfitting units of special troops with new combat equipment, increasing their combat capabilities, and the mechanization of work processes are conducive to decreasing the number of such units and the number of personnel therein. Thanks to new machines, many units (subunits) of special troops can perform the same work considerably faster than entire large units, using manual labor, could accomplish it during World War II. This makes it advisable to reduce the numerous intervening control organs and units of special troops for which no combat use can be found in the course of an operation.

Thus the headquarters of front and army engineer-sapper brigades and headquarters of sapper battalions in large units are becoming superfluous, since the direct control of units (subunits) within their makeup is really already exercised by the chiefs of engineer troops. The same applies to the headquarters of front and army communications regiments and headquarters of communications battalions of large units, since their subunits are under the direct control of the chief of communications.

At the same time, in our opinion, it is better to unite separate units of chemical troops under a single control organ, headed by the chief of chemical troops. This will eliminate the lack of control for these units which is presently felt by the chief of chemical troops, who has no communications means of his own.

After the suggested changes are carried out it will be superfluous to work out plans for the use of special troops in an operation, because these plans will actually duplicate combined-arms documents.

Summing up the foregoing, it can be concluded that the changed functions of the chiefs of arms of troops (special troops) make it possible to remove them from the system of control of the operational formations and shift them from consultants attached to the combined-arms commander into the actual executors of the tasks carried out by the forces and means left directly subordinate to the combined-arms commander. This will permit the removal of supervision of the lower-ranking combined-arms commander; also, by decreasing considerably the number of control organs directly subordinate to the senior commander, it will permit having one headquarters -- a single, highly flexible and numerically small organ for controlling the combat activity of all troops within the makeup of an operational formation.

In these conditions, staffs will be charged with the following functions: preparing information which will allow the combined-arms commander to make decisions, and drafting the necessary memoranda; planning combat operations and detailed support of the latter; collecting and collating of information on the situation and reporting it to the combined-arms commander and higher headquarters, and informing lower headquarters; transmitting tasks to the troops, directing and supervising their daily combat activities; directing restoration of combat effectiveness of troops and preparing them for performing impending tasks; and organizing points of control and communications.

The work of the staff will be most effective if the basis of its structure is the principle of independent execution, by each department (directorate) of a specific type of work for control of troops, without bringing in other departments. This will result in less time being spent in coordinating the efforts of the combined-arms large units (units), units of the arms of troops (special troops), and aviation, because all this work will be carried out by one department (directorate). At the same time, each department (directorate) will present the chief of staff and the commander an information summary on all the troops, forces, and means making up the operational formation.

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

IRONBARK

[redacted] 1.3(a)(4)

In our opinion, a staff should have the following departments (directorates):

-- the first -- which will take up the questions of organizing impending operations taking into consideration the situation as it takes shape; prepare recommendations for the combined-arms commander; carry out the planning of combat operations and their all-round support, and inform the troops of their tasks.

-- the second -- to direct the current combat activities of the troops in the course of performing the tasks assigned to them for collecting and collating information on the situation and presenting it to the combined-arms commander, and higher and lower headquarters, and also to transmit all current orders to the troops and undertake supervision of their execution; this department must have within its subordination all means of intelligence and traffic control.

-- the third -- to develop and carry out measures for restoring combat effectiveness and increasing the viability of troops, as well as their combat preparation for impending operations; units implementing activation of troops, and the training base should be subordinate to this department.

-- the fourth -- to organize troop control, that is, be in charge of establishment and movement of control points, and of their protection and defense of apparatus for communications between the points, and of control of troops by secure communications, and to supply them with topographic maps and charts; this department directs communications large units (units), and commandant's and topographic subunits.

-- the fifth -- to carry out the administrative and supply functions.

The makeup of each department (directorate) should include highly qualified combined-arms generals and officers, and generals and officers of the arms of troops (special troops) of various specialties. A combined-arms general (officer) should be at the head of a department (directorate). The organization of work in the departments (directorates) and coordination between them should be set up in the manner suggested by General M. Ivanov and Colonel K. Pashuk in their articles.

Such an organizational structure of a staff will eliminate another

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

important deficiency of control organs -- simultaneous execution by the very same departments (services) of work relating to preparation of information for making a decision, the planning of combat operations and their support, and also in regard to the collection of information on the situation and the immediate direction of the current combat activities of the troops. At the same time there will no longer be the need to involve a large number of officers in controlling the troops; duplication of work, lengthy coordinating processes and the basis of numerous documents, duplicating each other, will all be done away with.

A staff so constructed will have two vital departments -- the first concerned with matters of planning impending operations, the second, directing the current combat activity of the troops. This will permit more purposeful distribution of the efforts of the staff personnel in the control of the current activity of the troops and, at the same time, in the organization of impending operations.

In our opinion, such a distribution of functions will attain the best results, since a definite number of staff personnel, headed by a combined-arms general (officer), are dedicated beforehand to the execution of each task. Under the existing system, however, the decision in these matters is arrived at with the participation of the very same officers. The experience of numerous operational exercises indicates that the basic reason for unsatisfactory functioning of staffs in the matter of troop control, during the course of highly maneuvering and swift-moving combat operations, is the inability of the same persons to perform both functions equally well.

The suggested staff structure allows the combined-arms commander to receive simultaneously collated information on the situation regarding the enemy and all troops of the operational formation, and to work out measures which will reflect the combined activity of all arms of troops (special troops). It will become feasible to reduce considerably the quantity of documents processed in the staffs regarding troop control, mainly those dealing with plans for utilization of arms of troops (special troops), as well as types of support, since these documents actually only summarize the basic measures which are spelled out in documents of the combined-arms staff. It will be possible to bring in considerably fewer personnel for the purpose of troop control than under the existing system, by bringing in, in turn, the first four departments, depending on the actual situation, and also by concentrating the basic work for control of the current activities of the troops in one -- the second -- department (directorate).

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

IRONBARK

[redacted] 1.3(a)(4)

The chief of staff is given the best conditions for performing his functions, because he is relieved of the necessity of coordinating the activity of officers not under his subordination, and at the same time he is given a greater opportunity to study the situation and to organize combat operations, and the all-round support of the latter.

In our opinion, such an organizational structure of the staff is more convenient for work at the control points, because only the first, second and fourth departments (directorates) may be located with the combined-arms commander, and the efforts of these would be quite sufficient for performing the main functions of troop control. This will make it possible to decrease the personnel at the control points, increase their flexibility, significantly ease the work of communications equipment, and decrease its quantity, because it abolishes joint location of the combined-arms headquarters and the control organs of the chiefs of arms of troops (special troops) and services in one area (point), as it was in the past. It will be possible to disperse the points of troop control more, which undoubtedly will increase their viability.

The new organizational structure of the control organs is, in many ways, conducive to reducing the expense of their maintenance, and allows more effective use of the work of personnel and employment of the means of complex automation and mechanization of control processes. In addition, there will be need of only one system of automation for the combined-arms commander, capable of receiving and transmitting collated information on the situation.

And finally, the organizational structure of control organs suggested by us will avoid piecemeal control of operations of the arms of troops (special troops) and services, and point them, to a large degree, to the performance of tasks by combined efforts, that is, make the organization of troop control conform with their activities in the course of an operation.

It is known that an important place in the work of the combined-arms commander is occupied by the problems of materiel-technical and medical support. For directing materiel-technical and medical support, the combined-arms chief, in our opinion, also should have one control organ. This stems from the fact that in modern conditions the troops will be equally incapable of combat whether they lack materiel supplies or whether their equipment is not serviced and put into combat-effective condition. In turn, if the troops have a great amount of various combat equipment, and its performance depends on the supply of materiel on one hand, and on technical servicing

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

IRONBARK

[redacted] 1.3(a)(4)

and repair on the other, then these types of activity are made into one process. This is the reason for the need to unite the direction of materiel, equipment, and other types of rear support under the chief of the rear, directly subordinated to the combined-arms commanding officer.

In this, centralization of control of the rear must be carried out not only in matters of the organization of the rear, transport of materiel and technical equipment, and medical service, which are now the responsibilities of the chief of the rear, but also in matters of technical support as a second inherent part of modern rear services, which at present is under the jurisdiction of the various chiefs of arms of troops and special troops (services) not subordinate to the chief of the rear.

Thus, it seems to us that an administrative-organizational structure of control organs more suitable than the existing one, or the one suggested by Generals M. Ivanov, V. Arkhipov, and Colonel K. Pashuk, will be one in which the headquarters and the chief of the rear with his apparatus will be under the direct subordination of the combined-arms commander. Each of them will be concerned with a specific sphere of problems which require independent decisions on the part of the combined-arms commander. In our opinion, in conformity with modern principles of the use of troops in an operation, an operational formation must have within its makeup: combined-arms (tank) armies and combined-arms large units, an air army, including PVO troops, a large unit of missile troops and artillery, large units of engineer, chemical and communications troops, as well as units and subunits of intelligence, commandant's service, traffic control, and others.

With such a structure of the operational formation, the combined-arms commander can charge the lower combined-arms commanders with the fulfilment of tasks stemming from the goal and plan of the operation, and also will have means under his direct subordination with which he will be able to influence the course of the operation as a whole. At the same time, the organization of troop control is considerably simplified, and many intervening and, in our opinion, needless, control organs are eliminated.

SOURCE : A reliable source (B)

Following is a verbatim translation of an article titled "The Prospects of Development of Armored Combat Vehicles", by Major-General of Engineer-Technical Services L. Sergeyev.

This article appeared in the 1961 Fourth Issue of a special version of the Soviet military journal Voyennaya Mysl (Military Thought). This journal is published irregularly and is classified TOP SECRET by the Soviets. The 1961 Fourth Issue went to press on 20 October 1961.

Headquarters Comment: "Military Thought" is published by the USSR Ministry of Defense in three versions, classified RESTRICTED, SECRET, and TOP SECRET. The RESTRICTED version is issued monthly and has existed since 1937. The SECRET version is issued irregularly. By the end of 1961, 61 issues had been published, 6 of them during 1961. The TOP SECRET version was initiated in early 1960 and is also issued irregularly.

The Prospects of Development of Armored Combat Vehicles

by

Major-General of Engineer-Technical Services L. Sergeyev

Now, perhaps, no one will oppose the tenet that the tank troops are best suited for conducting combat operations under conditions of a nuclear/missile war, that they, better than other arms of troops, can exploit the results of our own nuclear strikes against the enemy and have the most protection from enemy nuclear counterstrikes, and that they have great striking power and high mobility, as a result of which they are the basic strike force of the ground troops. Obviously it is not necessary to prove the dependence of all these qualities on the level of development of the armored equipment with which the tank troops are armed.

At the present time, because there is a rapid development of military equipment in general, and armor in particular, the danger that may arise as a result of losing qualitative superiority over the enemy from an equipment standpoint becomes apparent. In connection with this, it is necessary to emphasize that the greatest differences of opinion concerning military-technical progress are observed in the definition and determination of the actual directions of development of armored equipment.

In this connection, the statements of several authors in the pages of the Journal "Military Thought"*, concerning questions of future development of tanks, deserve serious attention.

A lot of attention was also devoted to these questions at the military-scientific conference that was conducted at the Military Academy of Armored Troops at the end of May 1961.

---

* Note: We have in mind the articles of Marshal of Armored Troops P. Rotmistrov and General of the Army A. Zhadov, Special Collection of Articles of the Journal "Military Thought", First Issue, 1961, and Lieutenant-General N. Slyusin, Collection of Articles of the Journal "Military Thought," No. 1 (56), 1961.

IRONBARK [redacted] 1.3(a)(4)

This article will expound on the prospects of development of basic types of armored combat vehicles that meet the conditions of utilizing tank troops in a nuclear/missile war.

Tanks

Despite the fact that tanks, in comparison with other equipment, have turned out to have the greatest ability to withstand nuclear bursts, new tanks have to be created, mainly taking into consideration a further increase in the effectiveness of their utilization in a war with wide-scale use of nuclear weapons and missile means.

The basic data on modern Soviet and foreign tanks are given in Table 1.

IRONBARK

The variety of combat tasks entrusted to tanks makesit necessary to broaden their combat qualities in such a way that they cannot be incorporated in one model. At the same time, because of economic and purely military considerations it is necessary to strive to reduce the number of essential tank types to a minimum.

Even though it is impossible to create a single universal type of tank in modern conditions, in the tank parks of all the armies a tendency is observed to find a basic type, the combat qualities of which would permit its utilization for performing quite a wide range of combat tasks. The other types of tanks will be more specialized in their characteristics.

In the foreseeable future, taking into consideration the development of armored equipment by our probable enemies, it is advisable to improve further our light, medium (basic), and heavy tanks, to develop artillery combat vehicles and also create infantry combat vehicles, which will probably replace the present armored personnel carriers in combat subunits of motorized rifle units and large units. Besides these combat vehicles, it is necessary to produce combat vehicles of special designation in more limited quantities (command vehicles, bridge layers, flame throwers, and others), built on the chassis of tanks.

A cutback of specialized production and a decrease in the inventory of spare parts must be achieved by creating a "family" of vehicles based on the components and mechanisms of mass produced types of tanks, with the maximum uniformity and standardization of components, mechanisms and other equipment both within the "family" and among the vehicles on which they are based.

The medium tank, being the basic tank and the one found in the greatest numbers, must fulfil the widest range of combat tasks. These tanks form the basis of the combat power of the major tank large units and formations, intended for performing independent operational tasks. In the composition of the motorized rifle units they are used for direct support of infantry. This great range of combat tasks being fulfilled makes the problem of determining the basic specifications of the medium tanks quite difficult and critical. The difficulty of resolving it is indicated by the fact that, for a decade (1937 to 1947), in the British army it was considered impossible to create one type of medium tank, as a result of which the major tank large units were armed with high-speed

[redacted] 1.3(a)(4)

[redacted]

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

IRONBARK [redacted] 1.3(a)(4)

"cruiser" tanks and slow "infantry" tanks which were issued for direct support of infantry.

From the nature of the combat operations of medium tanks it is apparent that combat with enemy tanks will be unavoidable for them and will be one of the most important missions. Therefore the weapons of these tanks must first of all be antitank, capable of destroying the basic tanks of the enemy. Besides, it is called upon to fulfil many other fire tasks (for example, the incapacitation of personnel in armored personnel carriers and in shelters). Consequently, the armament of medium tanks must be versatile and multipurpose.

With the improvement of the means of antitank defense and the increase of the combat qualities of enemy tanks, firepower increased, the thickness of the armor increased, and the weight of medium tanks increased correspondingly. At the present time the weight of our tanks of this type has reached 36 tons, in West Germany (experimental model) - 35, in Japan and Switzerland - about 35 tons. In the USA and the UK, the combat tasks of medium tanks are fulfilled by 46 to 50 ton tank

Research carried out by industry and in the Military Academy of Armored Troops shows that with the retention of tube artillery systems for the armament of the tank, the optimum combat weight of a medium tank in the next few years will be approximately 36 tons. It is highly undesirable to increase further the weight of the medium tank. But it is also completely unacceptable to reduce the weight at the expense of its protective features.

Reduction of the weight of a medium tank, with simultaneous improvement of its protective features, an increase in its mobility, and the growth of its firepower may clearly be achieved by switching over to guided missiles. However, for the time being, the basic armament of a medium tank will be a gun. At the present stage of guided missile development, they still cannot satisfy two contradictory requirements - versatility and antitank effectiveness. In connection with this (as a stage in the assimilation of guided missiles), it would be interesting to combine a powerful antitank gun with guided missiles (URS). In this case the latter must be located inside the tank and be launched by means of a gun. They (URS) will be used for destroying enemy tanks at great distances, i.e., it will be a specialized supplement to the basic (gun) armament of the tank.

[redacted] 1.3(a)(4)

[redacted]

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

IRONBARK [redacted] 1.3(a)(4)

In order to increase the firepower of the tank it is necessary to have a rangefinder and automatic loading, equipping it with a night sight and devices for night vision that work without special lighting.

The armor of the tank must ensure reliable protection from mass antitank weapons and the best possible protection from the basic tank and antitank guns of the enemy.

It is necessary for the medium tanks to have high mobility in order to ensure swift tempos of the offensive, the best utilization of conditions created by the delivery of nuclear strikes against the enemy, and for rapid dispersal when there is a threat that the enemy will use these weapons. The necessary mobility, with the possibility of attaining average speeds of movement over the terrain of about 35 to 40 km/hour may be achieved in tanks with the utilization of improved transmissions with automatic or semi-automatic drive, and with the creation of a suspension that ensures a very smooth ride. Moreover, the maximum speed of the tank should be 70 to 75 km/hour, for which it is necessary to increase the power of the tank by approximately 25 HP/ton.

In order to increase the maximum effective range of the tank troops, the cruising range of the tank must be substantially increased in comparison with that which has been achieved in our modern medium tank.

The tank must have effective special antiatomic protection (PAZ) from all the destructive effects of a nuclear burst. Special attention should be given to increasing the biological protection of the crew from penetrating radiation.

Fundamental improvements in protecting tanks from all the various modern destructive means must be found in completely new elements, in particular the compact accommodation of a reduced crew. In this case, it will be much simpler to carry out the appropriate complex (armor and biological) protection of the crew, without detriment to the other combat characteristics of the tank.

The tank must be suited for moving along the bottom of rivers with the aid of simple equipment for underwater driving (OPVT) and for floating with the use of individual means of flotation.

[redacted] 1.3(a)(4)

IRONBARK

[redacted] 1.3(a)(4)

Heavy Tank. In modern conditions the heavy tanks that have, in comparison with the medium tanks, more powerful armament and considerably better protection, are a means of qualitative reinforcement of the medium tanks, and are the most powerful weapon for combating the tanks of the enemy.

The qualitative reinforcement of medium tanks, as is known, may be attained with the assistance of heavy tanks or assault guns created on the chassis of the medium tank and differing from it by having more powerful armament. The first method is preferable. The powerful armament of the heavy tanks increases the possibility of their combat utilization, especially in offensive operations.

With the adoption as armament, by our probable enemy, of 105mm rifled guns that have quite a high muzzle velocity of subcaliber projectile, as the basic artillery weapon of its mass-produced types of tanks, with the presence of various means for reinforcing them, it becomes necessary to create qualitative means for reinforcing our medium tanks in the form of heavy tanks or other combat vehicles that differ from the medium tank, at least by the fact that they have more powerful armament.

Since the basic task of the heavy tanks will be the destruction of enemy tanks, they will, to a greater degree than the medium tanks, be better suited for the installation of guided missiles (URS) as their main armament. The use of URS opens the most effective path for increasing the firepower with a sharp improvement in protective features.

The future development of the heavy tank depends on increasing its firepower, increasing its armor protection, and ensuring a more effective system of antiatomic protection than other types of tanks have. An increase of the combat qualities of heavy tanks must be achieved by implementing new decisions on specifics, based on the use of new armament.

Light Tank. The broadening of the sphere of tank use in conditions of a nuclear/missile war makes it necessary to have well-armed light tanks, among which it is possible to single out the following types: reconnaissance, antitank and tanks of airborne troops.

[redacted] 1.3(a)(4)

[redacted]

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

IRONBARK

1.3(a)(4)

[redacted]

Reconnaissance combat vehicles perform intelligence, combat security, pursuit, and communications tasks. Their distinguishing features are high mobility and cross-country ability. In order to achieve these qualities, striving to get low weight, firepower and protection are sometimes sacrificed. However it should be kept in mind that with the fulfilment of the task of security with such vehicles, it is often necessary to halt enemy tanks at favorable lines, and to be subjected to the effects of various fire means during pursuit.

Antitank combat vehicles are an important supplement to the heavy tanks, as a highly mobile antitank reserve. They can, in a very short period of time, be moved in a sufficient quantity to the point of an enemy tank breakthrough, for example, into the zone of a nuclear burst. The quickly created antitank screen will slow down the enemy advance before tanks with more powerful armament arrive. With the limited weight, these vehicles will have relatively weak armor protection and will be inferior to the medium (basic) ones in respect to firepower. If it is necessary to have multipurpose armament for the reconnaissance vehicle, then, for similar vehicles, it is possible to use guided missiles, even some of the simpler ones.

Airborne landing tanks are necessary for the airborne troops. A landing is an important target and will definitely be attacked by enemy tanks. It must be capable of maneuver and must have an adequate strike force to capture important objectives. Low weight and unavoidable limiting of armor and firepower are obvious for the airborne troops' (VDV) tank. At the same time it is assigned quite complex tasks. They need armament that is both versatile and quite effective from the antitank standpoint. The armor must provide protection from the fire of large-caliber machineguns and small-caliber automatic guns. It is very difficult to combine all these characteristics. But if an effective airborne landing tank is created, it will be able to fulfil the functions of both a reconnaissance and a light antitank vehicle. Obviously such a multipurpose light tank must have a 76 to 85mm caliber gun, capable of destroying the basic enemy tanks (mainly their side armor) at medium distances. As an additional antitank weapon it may have several guided missiles of the simplest design, located, for example, on the turret and guided by wires. The tank must have automatic loading and be equipped with a rangefinder.

[redacted] 1.3(a)(4)

[redacted]

1.3(a)(4)

The maximum speed of such a tank must be higher than that of medium and, especially, heavy tanks. We should recall one of the lessons of the last war: light tanks, that were inferior to the medium ones in respect to mobility, were found to be useless for fulfilling combat support tasks. Seeing that their armament (37 to 45mm guns) did not constitute any danger for the medium tanks, not to mention the heavy, production of our light tanks was halted in 1943, and in Germany a year earlier.

The system of antiatomic protection of the tank being proposed must consist mainly of carrying out hermetic sealing, introducing a filtering-ventilating installation, pressurizing the crew compartment, and ensuring simple decontamination.

In this tank, ensuring flotation will be of special concern, as this is contrary to the striving for compactness and small size. It is possible that this question will be resolved with the aid of stationary blocks of foam plastic (penoplast) or by other means with which it is possible to attain a temporary (during the time of floating) increase in water displacement.

It is necessary to note that the most successful light tank will not be able to replace the basic tank in an offensive operation. Of course the light tank will be cheaper than the medium one, but it will remain a specialized combat vehicle that is inferior to the basic (medium) tank in the complex "fire power-armor protection" that defines the effectiveness of a tank in a fire fight.

Infantry Combat Vehicles

At the present time the explanation of the basic tactical-technical qualities of a special combat vehicle for the infantry deserves very serious attention, the need for which, in conditions of a war with the use of weapons of mass destruction, is apparent.

The difficulties in determining the basic features of such a vehicle are explained by the fact that it must be the combat vehicle that is mass produced in the largest quantities, with the requirements and limitations that arise there from, imposed, first of all, by economics. At the same time, this vehicle must ensure the conduct of vigorous combat operations during the use of nuclear/missile weapons, the requirements of which cannot be satisfied by regular armored personnel carriers that are just a means of transport.

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

IRONBARK [redacted] 1.3(a)(

The variety of approaches cited for determining the basic features of the infantry combat vehicle makes it necessary for us to dwell on this question in greater detail.

Up to the present time the infantry is a necessary arm of the troops, even though its role and significance in the ground army has essentially changed. The basic strike force role passed from the infantry, first to the artillery (World War I), then to the artillery and tanks, and finally to nuclear/missile weapons and tanks. In examining the offensive operation, it may be said simply that the infantry is given the final functions after the enemy is subjected to strikes by the strike arms of the troops, and also the final assimilation of the captured territory.

The essence of combat utilization of infantry is the individual actions of individual soldiers within the framework of the organized collective. The infantry is capable of destroying the enemy to the last soldier, i.e., to bring the battle to an end, while the strike arms of the troops, as a rule, perform the cardinal, basic tasks of the battle, but do not bring it to an end.

Besides performing the functions of bringing things to an end, the infantry, in some cases, creates opportunities for using the strike arms of the troops, and carries out combat operations under conditions where the use of strike arms of the troops is not expedient (for example, when operating in mountains).

Under conditions of a nuclear/missile war, the infantry will not be able to fulfil its inherent functions with its old weapons. On the battlefield it must be mobile (motorized) and to a certain extent protected from a nuclear burst and its effects (armored). This can only be achieved with combat vehicles that are specially constructed for the infantry. It is of special importance to have such vehicles for the infantry in the tank troops.

Thus, infantry combat vehicles (PBM) are combat vehicles with the use of which the infantry retains its inherent peculiarities for conducting battle and acquires the protection and mobility on the battlefield that it lacks. In our opinion it is completely incorrect to examine the PBM only as a means for coordinating the infantry with the tanks, or as the means of transport to the field and partially on the battlefield. Infantry combat vehicles - are the basic infantry means

[redacted] 1.3(a)(4)

[redacted]

[redacted] 1.3(a)(4)

for carrying on combat in modern conditions. Therefore they must be constructed in such a way as not to limit, but on the contrary, to develop the positive qualities that are inherent to the infantry, thanks to which the infantry varies from the other arms of troops and justifies its existence.

Maybe the best solution of this question would be the creation of individual armored mobile vehicles, equipped with weapons, for a single soldier. However, at the present time this solution is impossible due to technical and economic considerations.

Proceeding from this, it is possible to formulate approximate requirements for the modern infantry combat vehicle.

It is visualized in the form of an armored (it must be closed and hermetically sealed) mobile, amphibious vehicle having high cross-country ability and holding several soldiers. The crew (landing force) must, to a certain extent, be protected from the effects of a nuclear weapon and its after-effects (thermal radiation, radioactive substances and others). While in the vehicle, they must have the opportunity to use their individual weapons. It is advisable to foresee the possibility of convenient and covered dismounting.

Obviously it is expedient to limit the size of the crew (landing force) of such a vehicle to a squad - the minimal TOE unit. A smaller crew (landing force) will lead to an undesirable increase in the total number of such vehicles, and a larger one will turn the infantry combat vehicle into a personnel carrier, where, in a number of cases, incomplete combat use of the entire landing force concentrated in the vehicle will be observed, and with its destruction the personnel will suffer heavy losses. Besides the landing force, the PBM must have a mechanic-driver and an operator for the fixed armament. The latter must remain in the vehicle in order to give fire support to the dismounted landing force. Therefore, total size of the crew (landing force) will be 7 to 10 persons.

The armament of the PBM must ensure the destruction of similar vehicles of the enemy, emplacements, and personnel. The individual weapons of the landing force, even if it is possible to use it actively in combat, cannot fulfil all these tasks. It is only capable of incapacitating enemy personnel, and even then at an insignificant distance. Therefore it is recommended to have fixed, light armament on the vehicle.

[redacted] 1.3(a)(4)

[redacted]

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

IRONBARK [redacted] 1.3(a)(4)

The fixed armament must be compact and have the ability to conduct all-around fire (360°), not require an increase in the size of the vehicle, and not decrease the ease of accommodating the landing force.

If such armament requires a special combat compartment with a rotating race (pogon) having a diameter of 1300 to 1500mm, this will complicate and increase the weight of the PBM, and will turn it into a combination artillery combat vehicle and armored personnel carrier. This will result in an unjustified complex vehicle which it probably will not be possible to create on a mass scale.

Apparently the most appropriate armament for the PBM will be a small-caliber automatic gun (20 to 30mm caliber) which will sometimes even destroy tanks. It should be kept in mind that fragmentation shells of a small-caliber gun give a substantially greater effect than a large caliber machine gun. The gun must be reinforced with a regular machine gun.

With light guns, it is possible to install several infantry-type antitank guided missiles (PTURS) at the sides of the turret.

For effective utilization of the small arms of the landing force, the riflemen can best be located along the vehicle, facing the sides, which should have ports and embrasures provided in them.

An infantry vehicle that is mass produced, compact, and if possible, light, cannot have armor capable of withstanding shells. It is advisable to protect the PBM from the fire of large-caliber machine guns, otherwise they will stop it just as easily as the standard machine gun stopped the infantry in World War I. The glacis plates of the PBM must have a design thickness of about 35 to 40mm. The sides cannot be the same, or the vehicle cannot be amphibious. However, 13mm sides will ensure protection from the fire of standard machine guns and, within the limits of a target angle of ± 30°, from the fire of large-caliber ones also.

The special protection of the PBM must include the hermetic sealing of the body and a filtering-ventilating system for the collective protection of the crew from radioactive substances, and chemical and bacteriological weapons. It is not obligatory for the PBM to have higher speeds (average and maximum) than the tanks, but in principle they are helpful. Obviously, the power rating of 20 HP/ton and a maximum speed of 70 to 75 km/hour will be adequate for it.

[redacted] 1.3(a)(4)

[redacted]

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

IRONBARK [redacted] 1.3(a)(4)

The cruising range should not be less than for tanks. The cross-country ability of the PBM should be no worse than that of the tanks. Fundamentally this can be ensured with tracked or improved wheeled running gear.

Without going into detail regarding the advantages and disadvantages of tracked and wheeled running gear, we will only point out that a thorough analysis shows that it is expedient to use tracked running gear on the PBM. With tracked running gear it is possible to have a simpler transmission, running gear, and body, and it is considerably easier to make them buoyant by using ordinary caterpillar tracks for this purpose. With other conditions equal the vehicle has smaller dimensions and weight. On the whole these parameters for a mass-produced vehicle are decisive and the necessary assurance of a caterpillar track service period of 8000 to 10,000km is not a problem for a light vehicle. This problem can be resolved fairly easily by using rubber and metal couplings.

The comparatively low weight of the infantry combat vehicle permits making it amphibious. Since the attainment of high speeds in water is not an obligatory requirement of the PBM, its bucyancy in water can be achieved by using ordinary caterpiller tracks.

Seeing that the infantry combat vehicle must be the vehicle found in the army in the largest numbers, it is necessary to strive for it to be of minimal weight, simply constructed, and cheap, so that it would be possible to make wide-scale use of standard components of the automobile-tractor industry.

All this makes great demands on the space allocation (komponovka). If the quality of the allocation in the tank is evaluated by how much of the interior volume of the vehicle is left for the combat compartment, then for the PBM the largest portion of the interior volume should be devoted to personnel.

The space allocation of the PBM must be original. It is doubtful that the chassis of other vehicles (for example, of the reconnaissance tanks) can be used for it. On the contrary, it is more likely that on the chassis of this mass produced vehicle other vehicles in the same weight category, may be created.

[redacted] 1.3(a)(4)

[redacted]

[redacted] 1.3(a)(4)

In principle it is possible to have two logical arrangements of such vehicles. The first - the motor and transmission complex and the mechanic-driver are located in front, occupying 1/4 to 1/3 of the vehicle length; the other space remains free for accommodating the landing force and armament; the rear is made in the form of a hinged ramp.

The advantages of this arrangement are the ease of accommodation and convenience of disembarking the landing force, and the wide possibility of using the chassis of such a vehicle without substantial alterations (thanks to the presence of vacant space) for command-staff, reconnaissance, medical, transport, and other vehicles. However, with this arrangement it is difficult, when the vehicle is floating, to distribute the weight of the heavy nose section to the rear. Besides, the vehicle becomes rather long.

The second arrangement - the motor and transmission complex are located in a narrow tunnel along the center line of the vehicle, with the motor in the rear section and the transmission in the forward part. The landing force is located along the sides of the vehicle with their backs to the tunnel. In order to decrease the width of the vehicle it is possible to turn the soldiers of the landing force slightly forward. The armament and its operator are installed in the forward part of the vehicle, along with the mechanic-driver. The rear is made in the form of a hinged ramp, the same as for the first variant. This arrangement permits obtaining the minimum length and floating balance, but it is inferior to the former in versatility (because of the tunnel along the center line of the vehicle).

Working this out with sketches has shown that the PBM in the tracked version, that fulfils all the requirements examined above, may be created with a weight of 8 to 10 tons.

It should be said that in the armies of the USA, West Germany and France, a considerable amount of attention is given to developing infantry armored personnel carriers.

So far the US Army is concentrating exclusively on tracked vehicles. It is assumed that all the infantry will conduct combat operations in armored personnel carriers.

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

The Bundeswehr is only beginning to create a pool of armored personnel carriers and is also concentrating on tracked vehicles. Moreover, they make wide-scale use of the French and Swiss experience. In West Germany they also operate on the principle that infantry must operate in armored personnel carriers.

Several armored personnel carriers have been introduced as armament in the French army, but they are produced in a limited quantity. The appearance of the wheeled, armored personnel carrier "Panar" must be viewed only as an attempt to test the possibility of creating an armored personnel carrier on the chassis of the reconnaissance armored car "Panar".

So far the British army does not have any tracked armored personnel carriers. The basic vehicle of this type is the wheeled armored personnel carrier "Saracen". It should be said that in it, to a certain extent, it was possible to combine a moderately complex chassis with satisfactory cross-country ability.

Table 2 presents data on modern vehicles that are used for the infantry. The majority of them are still just a means of transport, and do not provide the infantry with the opportunity to carry on combat operations under the new conditions. However, some of the foreign vehicles mounting appropriate armament may approach the prospective PBM that we have examined.

Let us dwell on individual models of armored personnel carriers.

The Soviet wheeled, armored personnel carrier BTR-152 does not stand up to criticism. In the pursuit of an economic commercial chassis, a vehicle was created that does not satisfy the given requirements as regards cross-country ability, unit power rating, and several other parameters. The combat qualities of this vehicle equate with the level of armored personnel carriers used in the years of World War II.

The tracked, armored personnel carrier BTR-50PK possesses a more improved design, but neither does it satisfy many requirements. Without dwelling on its merits, let us note the faults. In actuality, this is a means of transport for carrying a landing force of 20 persons. The latter are accommodated in crowded conditions in the central part of the vehicle and, located there, they cannot participate in combat. Dismounting of the landing force is difficult. The vehicle does not have fixed armament. The glacis plate is not thick enough. The arrangement of the vehicle is poor

[redacted] 1.3(a)(4)

[redacted]

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

IRONBARK

[redacted] 1.3(a)(4)

for use as a PBM - with the large size of the vehicle the landing force is accommodated on a "postage stamp". This is a result of using the chassis of an amphibious tank. The special propellers for traveling through water are an unnecessary luxury for a vehicle of this type. On the whole the design of the armored personnel carrier is complex, heavy, and also quite expensive. Finally, its mobility (speed, cruising range) leaves much to be desired.

Some of the most successful foreign models appear in a much better light, even though they also have faults. Here we have in mind the vehicles M113 (USA, Illustration 1); "Hotchkiss" (France, West Germany, Illustration 2); "Hispano-Suiza" (West Germany, Switzerland, Illustration 3); and "Pirate" (Switzerland). These armored personnel carriers have the smallest size and weight. The landing force (approximately a squad) is conveniently accommodated in the enclosed body and can, to a certain extent, participate in combat. Convenient dismounting is provided through a ramp at the rear. They make wide-scale use of motor vehicle engines and transmissions. Some vehicles ("Hotchkiss", "Hispano-Suiza") have an automatic small-caliber gun (with a muzzle velocity of 100 meters/second). The others have a large-caliber machine gun in a rotating turret. Some of the models (AMX, "Pirate", M113) are equipped with a PAZ system.

The AMX armored personnel carrier cannot be counted with the best, despite a number of good features (for example, the armor), as a result of a somewhat excessive landing force and great weight. The wheeled, armored personnel carrier "Panar" has a very unique design, but due to its great complexity (which is probably not acceptable for a mass-produced vehicle), it is only interesting from the technical standpoint.

The PBM that our army needs must considerably surpass the best foreign vehicles that have been examined. Here, it must be considered that it will still only be under development, and that these vehicles are already introduced into the armament, and will probably be improved. Therefore, there should be a large measure of qualitative superiority in its makeup, such as: very small dimensions and weight with convenient accommodation of the landing force, armament (free rockets), that is even capable, if necessary, of destroying tanks, adequate armor protection from large-caliber machine guns, and together with all this, it should be amphibious.

Artillery Combat Vehicles

Despite the presence of nuclear weapons, artillery support may be necessary for successful operations by tanks and infantry, especially when they are separated from the other forces. Therefore, it is desirable for the tank troops to have mobile tracked vehicles with light armor, equipped with howitzer or rocket armament (free rockets) and designated for artillery support of the tanks. Such vehicles should not be confused with the turretless tanks with shell-resistant armor, the so-called assault guns (SAU) of wartime. Artillery combat vehicles (ABM) usually carry out group fire from concealed positions at a definite distance from the enemy.

The ABM, in conformity with the missions it fulfils, must have shells that have good high-explosive fragmentation action, considerable range of fire, capable of destroying area targets, good lateral and range fire maneuverability, and, moreover, a large unit of fire. The most expedient armament is the howitzer (larger caliber than on tanks) or free rockets (multiple launching mount). It is recommended that only part of the vehicles be armed with the latter, as a supplement, capable of creating a high concentration of fire. Howitzer armament must be located in a closed revolving turret. Bulletproof armor giving protection from standard caliber automatic fire, is completely adequate - such vehicles avoid direct contact with the enemy.

The arrangement and chassis of the ABM should be the same as for a light tank, only having a different turret. For stability there should be a spade (soshnik) and suspension idler wheels. The questions of antiatomic protection should be resolved in the same manner as for other vehicles having light armament - light tanks and infantry combat vehicles.

The ABM has been developed to the greatest degree in the US Army where the artillery battalions of tank divisions are armed with 105mm and 155mm self-propelled howitzers. As an example of a vehicle of this type, Illustration 4 shows a T196 self-propelled howitzer of the American Army. Its weight is 18 tons. It is completely armored (bulletproof). The 155mm howitzer is mounted in a revolving turret. The range of fire is 16,000 meters, and the unit of fire is 50 rounds. The vehicle overcomes water barriers afloat, under its own power.

[redacted] 1.3(a)(4)

[redacted]

[redacted] 1.3(a)(4)

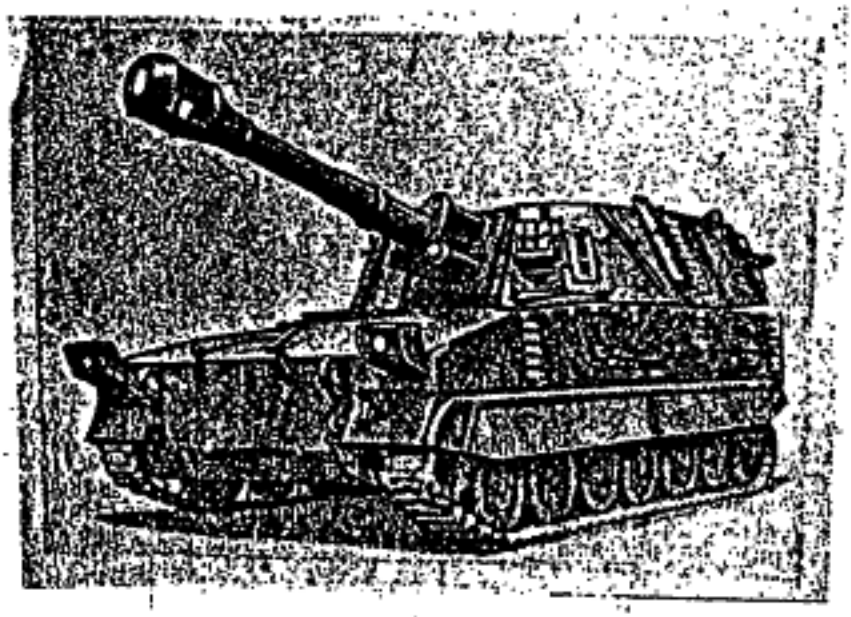

Illustration 4. 155mm T196 Self-Propelled Howitzer (USA)

Besides the field-type ABM used in the tank divisions for direct artillery support of tanks, it is now necessary to have high-powered ABMs. Such vehicles are intended for inflicting nuclear or conventional artillery strikes at distances of 20 to 30km. Their design can duplicate that of the field-type ABM in many ways (in an enlarged form) and can be made on the chassis of the basic tank. Either 150 - 175mm caliber guns or medium-caliber free rockets (missiles) may serve as armament. A vehicle of this type is shown in Illustration 5. This is the 175mm T235 atomic assault gun of the US Army. Its weight is 26 tons, and range of fire is 30,000 meters. The mechanic-driver is located in an armored cab. The crew and an additional unit of fire are located in an auxiliary armored personnel carrier. The vehicle has quite a large cruising range (800 km).

High-powered ABM's may be attached to tank divisions or even included in their composition.

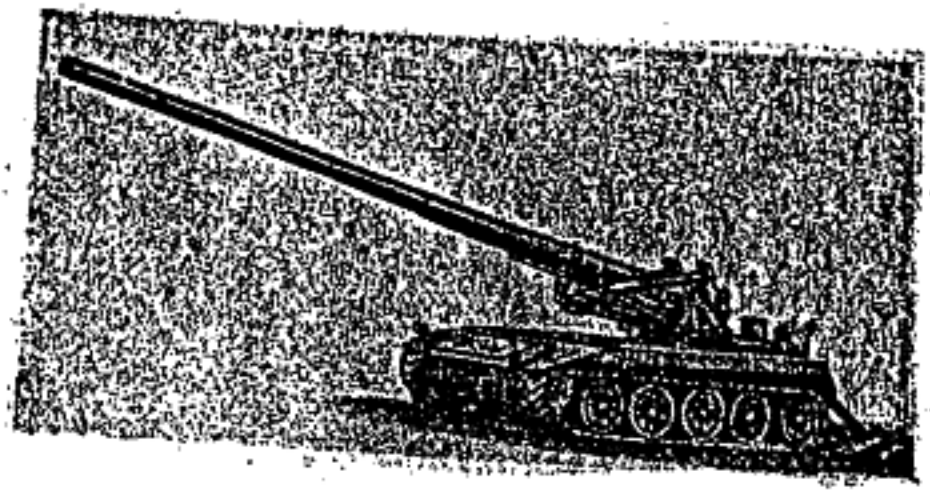

Illustration 5. 175mm T235 Atomic Assault Gun (USA)

Vehicle on an "Air Cushion"

Let us evaluate the prospects of military application of vehicles flying slightly above the surface of the ground by using supporting ("air cushion") running gear. In order to have such a vehicle travel above the surface of the ground and above water, the pressures exerted at its base are limited by values of approximately 50 to 100 kg/m^2. This means that a vehicle that weighs approximately 10 tons must have, with a fairly small expenditure of force, a base area of more than 100 square meters. The uppermost limit of the above-indicated pressure is applicable for some planned vehicles of greater weight, and the lowest has been implemented in various types of flying motor vehicles and in the British vehicle "Hovercraft".

The large length and width, with a comparatively small lift height (not over 0.4 meters) and the small size of slope negotiated (from 8° to 13° in prototypes) limit the possibilities of wide-scale application of such vehicles for military purposes, permitting them to move only over roads, unusually level terrain, and over calm water surfaces.

The advantages of utilizing supporting running gear consist of the fact that in comparison with the engines of aircraft (helicopters) it permits reducing the power from approximately 200 HP/ton to 80 to 100 HP/ton. Moreover, according to data in the foreign press, the useful load may reach 40 percent of the weight of the vehicle.

If we limit ourselves to a small clearance (of up to 0.4m), then the basic faults of a vehicle with supporting running gear will be: complexity of design, connected with ensuring control during movement, large size, and limited cross-country ability when moving over uneven terrain. If their clearance is increased, then the power necessary to lift it will grow rapidly and will attain values that modern aircraft have. The power limitations are approximately the same for "flying jeeps" that have ducted rotors. With an increase of the clearance, the load capacity decreases sharply, the expenditure of fuel increases, and the cruising range is reduced.

Taking into consideration everything that has been stated, it is possible to visualize two types of such combat vehicles:

-- small vehicles, intended for movement above land and water, which will be ground troop equipment; their intended combat use will be reconnaissance and communications; increasing the clearance will lead to unfavorable parameters of the unit power rating which, however, may prove necessary; therefore we do not rule out the possibility of utilizing a vehicle of the "flying jeep" type with ducted rotors;

-- fairly large vehicles that are a means of transport, obviously they will be used to advantage for moving over water, but also will be able to move over fairly level terrain.

* * * *

During the last few years, the combat characteristics and, above all, the firepower of the tanks of our probable enemies have increased significantly (see Table 1). The correlation of the combat qualities of our medium tanks and the basic tanks of the US Army has become less favorable than it was several years ago. Therefore, it is necessary to apply serious efforts to creating new models of tanks that would be superior to the foreign ones. It is also clear that successful ground troop operations are possible only if they are equipped, not only with high-quality tanks, but also with a number of other combat vehicles that answer modern requirements.

SUBJECT : MILITARY THOUGHT (TOP SECRET): "The Problem of the Organizational Structure of Front and Army Field Commands", by Lieutenant-General N. Volodin

DATE OF INFO : October 1961

APPRAISAL OF CONTENT : Documentary

SOURCE : A reliable source (B).

Following is a verbatim translation of an article titled "The Problem of the Organizational Structure of Front and Army Field Commands", by Lieutenant-General N. Volodin.

This article appeared in the 1961 Fourth Issue of a special version of the Soviet military journal Voyennaya Mysl (Military Thought). This journal is published irregularly and is classified TOP SECRET by the Soviets. The 1961 Fourth Issue went to press on 20 October 1961.

Headquarters Comment: "Military Thought" is published by the USSR Ministry of Defense in three versions classified RESTRICTED, SECRET, and TOP SECRET. The RESTRICTED version is issued monthly and has existed since 1937. The SECRET version is issued irregularly. By the end of 1961, 61 issues had been published, 6 of them during 1961. The TOP SECRET version was initiated in early 1960 and is also issued irregularly.

The Soviet critique of the rear services exercise mentioned on page 6 was disseminated as [redacted] 1.3(a)(4)

The Problem of the Organizational Structure of Front and Army Field Commands

by

Lieutenant-General N. Volodin

Recently, in the pages of the Special Collection of Articles of the Journal "Military Thought", consideration has been given widely to the problem of the organizational structure of operational headquarters. On this point a number of authors have properly pointed out that the existing organizational structure and equipment of front and army field commands require radical reexamination, as they are inconsistent with the changed nature of modern operations and the demands made on troop control. We are fully in agreement with this view.

Under modern conditions, control points (punkt upravleniya), as the organs for directing combat operations, are one of the important objectives for enemy nuclear strikes. This is especially true of the major operational headquarters - those of fronts and armies.

For this reason the most important condition for ensuring firm and uninterrupted troop control is, in our opinion, an increase in the viability, mobility, and maneuverability of headquarters. This can be attained provided the headquarters have few personnel and are well equipped with the latest technical means of control, and also with staff cars having good cross-country ability and suited for the work. Only under these conditions will a headquarters be able to move rapidly behind the troops, and more frequently change its location, and thus sharply reduce the possibility of its discovery by the enemy and destruction by nuclear weapons.

As already noted in the press, the front and army field commands in existence at the present time in accordance with the provisional TO&E, are too unwieldy, insufficiently mobile,

[redacted] 1.3(a)(4)

[redacted]

[redacted] 1.3(a)(4)

and inadequately supplied with means of control and movement. By virtue of this, as has been shown by the experience of exercises in postwar years, the headquarters of a front is able to move not more than once in two or three days, and an army headquarters, once a day. It is entirely obvious that with modern tempos of attack of 100 km and more per day, such a situation is fraught with the danger of loss of troop control and may lead to failure of the operation.

Before taking a look at the organizational structure of the control organs, let us dwell briefly on the new technical means of troop control, by which we mean first of all the means of "elementary mechanization" ("malaya mekhanizatsiya"). In our opinion it is necessary to introduce more widely into all headquarters selector communications, communications scrambling devices, radio-commutation, photocopying devices, electronic-electric screens and plotting boards (these last particularly in the headquarters of missile troops and artillery and of chiefs of PVO troops), and it is also necessary to improve the sets of various stamps, etc. It is especially necessary to create models of staff cars and of field equipment for the work of headquarters. All this will play a positive role in increasing the operational efficiency of headquarters work.

As a positive example one may even cite the use in one of the exercises of the Carpathian Military District, in the spring of 1961, of the mobile photo-laboratory of an airborne army, for the reproduction of small graphic documents and diagrams. The laboratory crew of three men, headed by an officer, reproduced in a very short time hundreds of various diagrams, graphs, designs and schedules, substituting for the labor of no less than 30 officers and draftsmen. Positive results have also been achieved by the use of a field cartographic unit for the reproduction of documents supplemented by maps. Despite the duration and imperfection of the technological process, because of the improved organization of the work, the time for the issuance of the documents was significantly decreased. In one of

[redacted] 1.3(a)(4)

the divisional exercises in the Carpathian Military District, a field cartographic unit, staffed by a small group of officers, NCO's and enlisted men, reproduced hundreds of graphic documents, a thing which was not within the capabilities of the entire district headquarters.

Passing on to the problem of the organizational structure of control points, we believe that the existing division of them into forward command posts (PKP), command posts (KP) and rear control points (TPU) is correct in principle, since this does increase the viability and operational efficiency of headquarters to a considerable degree. Such a system, however, does not fully guarantee the firm and uninterrupted direction of the combat operations of troops, especially of missile troops and the forces and means of PVO and of aviation. Such a system does not permit the effecting of coordination of the control points in case one of them is put out of action, and it leads to parallelism in the work and to duplication of one another.

The experience of exercises underscores the views expressed in previous articles of the Special Collection to the effect that the forward command post of a front or army, by virtue of its small staff and inadequate equipment of control means, cannot fully substitute for a KP when the latter is put out of action. In fact, how can one speak of such interchangeability of a PKP and KP when, for example, the missile troop and artillery chiefs of a front or army are at the PKP, and have the basic means for controlling missile troops at the KP and do control them through their headquarters, which is also located at the KP. Such a situation can occur also for the chief of the PVO troops of a front or for the commander of an airborne army, where the basic means of control are located at the command post of the front or airborne army.

Besides this, it is from the command post that the basic communications are maintained for coordination and communications with higher headquarters. Together with this, the attachment of almost all the responsible persons, the best and most highly trained generals and officers, and

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

IRONBARK

[redacted] 1.3(a)(4)

also a considerable part of the control means, to the forward command post, seriously weakens the command post, which, in case the PKP is put out of action, will experience great difficulties in troop control.

Therefore, in our view the personnel and equipment of control points must be such that in case one of them is put out of action, another can substitute fully for it.

The organizational structure which we are proposing for a front field command (Diagram No. 1) basically comes to the following.

A command post and an alternate command post (ZKP) are created within the front, which are capable of independently carrying out full and purposeful direction of troops. In addition, a rear control point is set up which will carry out the functions of missile, material-technical and medical support of operations, and in case of necessity may even temporarily assume control of the troops.

The command post and alternate command post of a front command are made up of personnel of directorates and departments of all arms of troops (or services) at reduced strength, which must ensure the direction of all arms of troops, as well as the organization and maintenance of uninterrupted cooperation among them.

In order to guarantee stability of troop control, each KP and ZKP must be provided with identical communications regiments, the forces and means of which will permit the organization of communications in two positions. The rear control point is provided with a communications battalion and a separate communications company of the missile rear. The makeup of the remaining communications units may be the same as that stipulated by the provisional TO&E.

Correspondingly the communications within a front are also organized into a KP, ZKP, and TPU.

Thus, all the control points of a front are equipped

[redacted] 1.3(a)(4)

[redacted]

[redacted] 1.3(a)(4)

with autonomous communications, thus guaranteeing their independence and reliable communications with the troops and among themselves.

This system of organizing troop control into a KP, ZKP, and TPU was tested in the operational-rear services exercise in the Carpathian Military District in July 1961 under the direction of the Commander-in-Chief of Ground Troops, Marshal of the Soviet Union V.I. Chuykov, and produced positive results.

As has been shown by the experience of this exercise, it is advisable to locate the ZKP 40 to 50 km from the KP, to the side or in front of it, and, in the interests of security, for a specified period of time complete radio silence is observed in it, and strict limitation of messages over technical means of communication. The ZKP receives all information on troop positions and combat operations from the command post by "VCh" telephone, by telegraph with a communications scrambling device, or by mobile means. During this period, part of the officers of the ZKP may be used for work with the troops.

If the KP should be put out of action, the alternate command post is automatically transformed into the command post and completely takes over troop control. During shifts of the KP, the control of troops may temporarily rest with the ZKP.

Because of the importance of intelligence in modern operations, all means of it are concentrated in the hands of the chief of intelligence of a front, in order to ensure the purposeful use of these means for the prompt and full acquisition of information on the enemy, and above all on his means of nuclear attack.

Missile, material-technical, and medical support, as already pointed out, is effected from the rear control point of the front. The building up to strength and training of the reserves are directed from here, for which purpose the TPU will have a deputy troop commander of the front

[redacted] 1.3(a)(4)

[redacted]

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

IRONBARK

[redacted] 1.3(a)(4)

for combat training with a directorate of organization and replacements and a department of combat training.

In connection with the fact that problems of missile support have acquired exceptionally great significance and are one of the main tasks of the rear, it is proposed to introduce the position of deputy chief of the rear area of a front for missile support, subordinate to whom would be the directorate of missile and artillery armament and the missile fuels department.

As for tank-technical and motor-tractor support, the experience of the last war and of postwar exercises has shown that it is most convenient to solve these problems from the command post of the front, since it is from here that the planning of the operation is carried out, within which the problems of the use of armored and motor transport troops occupy a large place. Therefore, with the aim of increasing operational efficiency in the solution of these problems, it is more expedient to put the departments for armor and motor-tractor equipment in the command post, subordinating them to the deputy troop commander of the front for technical matters. Changes in the title of this position are dictated by considerations of eliminating varying interpretations of the problem.

In our opinion the positive aspects of the proposed organizational structure of a front field command are:

--achievement of interchangeability of control points, increase in their viability and stability, and ensuring uninterrupted troop control;

--decrease in the personnel of the field command of a front by one sixth in comparison with the provisional TO&E in force; the attainment of a greater reduction in the personnel of a field command obviously is not possible, since the means of automation and mechanization of control procedures are actually still only being developed and have not been tested in troop exercises; with the introduction of these means into troop units, the personnel of a front

[redacted] 1.3(a)(4)

[redacted]

[redacted] 1.3(a)(4)

field command can be further reduced by about one third;

--increase in the mobility of control points and in their capacity for rapidly changing their location, thus increasing the operational efficiency and flexibility of troop control.

The organizational structure of the field command of a combined-arms or a tank army can be analogous to that proposed for a front field command. Other forms, however, are also possible, one of which we have presented in Diagram No. 2. In essence it consists of creating two equal control points (the first and the second) in an army field command, which are capable of independently planning and carrying out operational troop control. A rear control point is also set up.

The basic directing nucleus of an army field command is the operations center. It includes the chief of staff, the chiefs of the arms of troops and of special troops (missile troops and artillery, engineer and chemical troops, PVO and communications), the chief of the operations department, the chief of intelligence, the deputy army commander for the rear, and five officers (three from the operations department, one for the rear, and one for the armored and motor-tractor service).

The operations center, which is headed by the army commander, will be located at one of the control points, and will direct the troops on the main axis, and the second control point will at the same time direct the troops operating on separate axes or cut off from the main forces. Part of the officers of the second control point can also be used to carry out occasional assignments in the troop units.

When necessary, an operations center headed by the commanding officer can quickly be transformed into the second control point. When one of the points is put out of action, complete direction of troop operations can be assumed by the second control point.

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

IRONBARK

[redacted] 1.3(a)(4)

The rear control point carries out all the functions inherent in the missile, material-technical, and medical support of the troops of an army. If the first and second control points are put out of action, the TPU may temporarily assume troop control. With this aim, officer-operators from the basic arms of troops are included in its makeup, and communications and cipher sections are set up.

All three control points ensure autonomous communications with the troops and among themselves.

The method of organizing the control points of a combined-arms or tank army obviously has advantages over the existing organizational structure and is more responsive to modern requirements.

TO: Chief, SR

FROM: Chief of Station, Moscow

SUBJECT: [redacted]/Meeting with [redacted] at Fourth of July Reception 1.3(a)(4)

REFS: A. DIR 0067
B. DIR 0072
C. [redacted]

1. Forwarded herewith is [redacted] report of his meeting with [redacted] 1.3(a)(4) in Spaso House during the Fourth of July reception held there. Here follows an account of the action taken here in preparation for this meeting and brief comment on the meeting itself.

2. The possibility of the meeting and the various contingencies with which we would be concerned if and when it took place were discussed with [redacted] when I returned from London. We decided that [redacted] would scout Spaso by 1.3(a)(4) himself for dead drop possibilities; this he did, for the last time on 3 July. The dead drop site finally selected was on the underside of the cover of the water tank of the only toilet in the men's room, and suitable preparations were made to accommodate a 9" x 4" x F package from us to [redacted] and a similar package from him to us.

3. To be included in the package from us to [redacted] were: 1,000 rubles in 25 ruble denominations; the operational note delivered here by [redacted]; the 1.3(a)(4) operational note received via reference A; and the addendum to the latter received via reference B.

4. [redacted] and I met, using the pretext of a security briefing by 1.3(a)(4) [redacted] in the secure room on 2 July. The entire meeting plan was reviewed with Mequis and, because we would not meet again until the morning of the 4th, he was briefed on the required action for a two-way pass via dead drop.

5. I met [redacted] on 3 July as agreed upon in London. He reported that, 1.3(a)(4) up to that time, there had been two meetings between [redacted] and [redacted] and that there would be no need for a two-way pass at Spaso; [redacted] might have something for us but he doubted it. I asked what had been passed by [redacted] to [redacted] and, from [redacted] account, it was clear that [redacted] had received everything we had for him. [redacted] also reported that [redacted] would not be available in the West per references A and B, apparently for the same reason which squelched his two earlier planned trips.

[redacted]

APPROVED FOR RELEASE
31 MAR 1992

[redacted]

[redacted] 1.3(a)(4)

6. At a second meeting with [redacted] on the morning of 4 July (with [redacted] and [redacted] also present), the final plan for identification of [redacted] to [redacted] and, as an outside possibility, a pass from him to us, was gone over and made firm. 1.3(a)(4)

7. [redacted] and PETROCHENKO of reference C (hereafter referred to as Identity) appeared in the reception line at 1225, the reception having been scheduled 1200-1330. With [redacted] stragetically stationed in the immediate area of the reception line (Minister Counselor and wife) to recognize [redacted] as he entered, the latter was immediately recognized and the signal given to [redacted] As the attached report and reference C indicate, there never was a problem in recognition but only in managing some sort of separation, at least temporarily, between [redacted] and his companion, Identity. This was never accomplished to our satisfaction. [redacted] chose a less-than-one-minute-long interval to turn completely aside from Identity in order to tell [redacted] that he would have something for him next time and to receive [redacted] reply in kind, but this was apparently as far as he wished to go. From [redacted] and my own observations, he was seen at no time during the reception without Identity. While this was a bit of a disappointment to us, since [redacted] had been briefed to touch on future contacts if this became securely feasible, [redacted] quite properly did not force the issue. We are all certain that [redacted] had good reason for refusing operational contact beyond the single exchange, and I regret that there were no clues which came to our attention during the reception which will take us beyond speculation as to this reason at this time. 1.3(a)(4)

8. PETROCHENKO is also something of an enigma to us at the moment, in that we are not yet certain how his name found its way to the invitation list. It does not appear on the "working invitation list" and, when I briefed the Minister Counselor this morning on the happenings on the 4th, he was unable to account for Identity's pressence. It is quite possible that the name was placed on the final list by [redacted] after the Minister Counselor had indicated to him that [redacted] should be invited (one name was apparently deleted in order to accommodate PETROCHENKO; we are forwarding both the working and the final list by the next pouch.) The calling card which PETROCHENKO gave to [redacted] would indicate that he belonged on the list, and we do not necessarily view it as sinister that he and [redacted] remained glued to one another during the reception (we cannot be entirely certain of who was watching whom); however, this behavior does fit the unfortunate pattern of [redacted] interest in [redacted] and to this extent we find it disturbing. 1.3(a)(4)

[redacted]

[redacted]

[redacted] 1.3(a)(4)
6 July 1962
page 3

9. I have the following comments on [redacted] contact report: 1.3(a)(4)

a. Para 2: [redacted] involvement with [redacted] was coincidental rather than contrived. He happened to be standing near [redacted] when Mrs. JONES when Mrs. JONES decided the time had come to spend some time with the Soviet guests, and forthwith introduced herself and [redacted] to [redacted] and his companion. (It is entirely possible that [redacted] recognized both names as connected with the [redacted] dead drop.) I should add that I observed [redacted] at one point in the reception, in animated conversation with [redacted] and his companion; I have not yet had the opportunity to debrief [redacted] but I will apprise you of any significant results as soon as I do. I find the coincidence which pushed [redacted] into contact and whatever it was that prompted the [redacted] contact, unfortunate, but there was so much mixing of the various groups and individuals within the groups that I do not believe these contacts should necessarily be viewed with alarm. 1.3(a)(4)

b. Para 3: From the limited opportunity I had for observation of [redacted] he was certainly in complete control of himself and on top of the situation. He demonstrated a willingness to mix with any and all, which he did. He was tastefully and neatly dressed, well barbered, and appeared to be in excellent health. I last saw him and PETROCHENKO drinking whiskey from shot glasses on the veranda at 1335, by which time the bulk of the Soviets--by no means all--had departed. 1.3(a)(4)

c. Para 3: The tobacco delegation mentioned here represents our first opportunity to get [redacted] and [redacted] together; we shall pursue it and keep you advised of any significant developments. 1.3(a)(4)

Attachment to [redacted] 6 July 1962 1.3(a)(4)

SUBJECT: Meeting with [redacted] at July 4 Reception 1.3(a)(4)

1. [redacted] was among the last to arrive at the reception, not coming until about 1225. He was with PETROCHENKO. [redacted] spotted him and gave the signal (a wink) to [redacted] After about five minutes [redacted] began 1.3(a)(4)
moving in [redacted] direction, talking briefly to Soviets, as he had been doing during the whole reception. He introduced himself to PETROCHENKO and then [redacted]. [redacted] had his coat unbuttoned and tie-clasp showing. The three chatted briefly and then PETROCHENKO said he was looking for WOODS. PETROCHENKO and [redacted] invited [redacted] to come into the barroom (next door) and have a drink. [redacted] said he would just look for WOODS. He could not find WOODS, so went in to have the drink. Then he was introduced to D. M. GVISHIANI and Ye. I. LEVIN. (Note: PETROCHENKO did most of the talking. [redacted] was, thought [redacted] slightly deferential to him. All, of course, were deferential to GVISHIANI.

2. [redacted] then walked away, going into the other room, ostensibly to look again for WOODS. He came back perhaps fifteen minutes later and saw 1.3(a)(4)
[redacted] and Mrs. Bill JONES talking to [redacted] and PETROCHENKO. [redacted] approached the group, but as [redacted] said "let me introduce you", [redacted] was pulled away by a somewhat drunk TIMIRYAZEV, Agricultural Academy official, and asked to drink to their new friendship. [redacted] returned in a few minutes, at which time [redacted] took [redacted] glass to fill at the bar. Thus [redacted] had his first chance to talk to [redacted] alone. The conversation was innocuous for a minute or so, when [redacted] said, "I will have something for you next time." [redacted] replied, "We will have something for you next time." [redacted] thinks [redacted] may have preceded his remark with something about "yesterday" but can't be sure. It might have been "Because of yesterday" or something like that. After this brief exchange the conversation returned to the social level. [redacted] tried to say something else, that we would try to arrange social meetings, but could not, as [redacted] turned the conversation back to pleasantries immediately. [redacted] did not get anything said except the one sentence above. The whole exchange was very brief. [redacted] did not change expression or give any indication of a variation in the conversation. The room was noisy, but there were people as close as four feet away, namely PETROCHENKO who was talking to someone else. [redacted] could hardly hear [redacted] from 1 1/2 feet away, either in his social conversation or in the one sentence noted above. [redacted] tried to move so that [redacted] could talk to him further (i.e., [redacted] went back to a nearby serving table a couple of times. [redacted] did not follow or even turn around. After perhaps five minutes more talk with [redacted] PETROCHENKO and others who wandered by, [redacted] left. He did not see [redacted] again. (Note [redacted] also asked [redacted] while they were talking alone, if his wife were here. [redacted] said yes, but he did not know where. They probably did not meet, as Mrs. [redacted] was at the other end of the house the whole time.)

[redacted]

[redacted]

Attachment to [redacted]

 1.3(a)(4)

3. [redacted] seemed relaxed, not at all nervous, but rather morose and not very lifely. There was no indication that he wished to cut short his talk with [redacted] nor that he did not want to talk to Americans generally. He talked freely with many, and, at least with [redacted] always in English, even if [redacted] spoke Russian. He drank a fair amount but was not at all drunk. (PETROCHENKO also talked only English.) They both suggested [redacted] come to see them at work, and [redacted] said he might have business with them because tobacco delegations were to be exchanged. 1.3(a)(4)

4. [redacted] talked more to PETROCHENKO than to [redacted] PETROCHENKO seemed to be superior to [redacted] but they were apparently friendly. [redacted] stayed with PETROCHENKO the whole time, never straying from his presence. (It might have been vice-versa. At any rate, they were always together.) 1.3(a)(4)

5. [redacted] may have spent somewhat more time with [redacted] and PETROCHENKO than with other Soviets, but not much, if any. He talked to at least two other parties for about the same amount of time, and with many others for briefer periods. He talked to Soviets the whole time of the reception (1200-1330). He does not believe that his conversation with PETROCHENKO and [redacted] were out of the ordinary. They, in fact, were far more forward than most others in talking to Americans. 1.3(a)(4)

6. [redacted] is positive the brief operational conversation went unnoticed by others. At any rate, [redacted] initiated it, apparently preferring to say a few words under those circumstances than to try to get alone with [redacted] even by turning his back on PETROCHENKO or walking ten feet away from him. 1.3(a)(4)

SOURCE : A reliable source (B).

Following is a verbatim translation of an article entitled "Several Questions on Evaluating the Effectiveness of the Basic Means of Antiair Defense of a Front, and Its Organizational Structure", by Colonel-General of Aviation S. Mironov.

This article appeared in the 1962 First Issue of a special version of the Soviet military journal Voyennaya Mysl (Military Thought). This journal is published irregularly and is classified TOP SECRET by the Soviets. The 1962 First Issue went to press on 29 December 1961.

Headquarters Comment: Military Thought is published by the USSR Ministry of Defense in three versions, classified RESTRICTED, SECRET, and TOP SECRET. The RESTRICTED version has been issued monthly since 1937, while the other two versions are issued irregularly. The TOP SECRET version was initiated in early 1960. By the end of 1961, 61 issues of the SECRET version had been published, 6 of them during 1961.

Several Questions on Evaluating the Effectiveness of the Basic Means of Antiair Defense of a Front, and Its Organizational Structure

by

Colonel-General of Aviation S. Mironov

The thinking abroad is that aviation will continue to be the basic means of delivering nuclear warheads for a long time to come, since the overwhelming majority of targets in the theaters of military operations are small in size and highly mobile, and the combat operations of both sides extremely mobile. The enemy's arsenal of means of attack includes flying apparatuses which represent air attack weapons with high combat capabilities. And, in our view, these characteristics should determine the nature of the requirements on the system of weapons of the PVO troops of ground troops.

As is known, among the basic tasks carried out by front PVO troops are: reconnaissance and destruction in the air of enemy means of air attack; neutralization of his ground and aerial radiotechnical means of control and guidance; destruction of airborne troops while in flight to the landing area, and at the landing area; and warning the front troops and the PVO of the Country about an enemy air raid.

To carry out these tasks, the front PVO has at its disposal radiotechnical troops, antiaircraft artillery, antiaircraft missiles, and fighter aviation.

It is completely obvious that any system of troop formation, including that of the front PVO troops, will attain the highest combat and operational effectiveness if the role and place of all basic combat means in the system are correctly defined.

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

Therefore, it would be advisable to examine in detail the role and place of the basic combat means within the PVO system of a front, especially since the press has carried articles in which authors have presented contradictory views, sometimes highly praising one type of weapon while undeservedly depreciating the value of another. For example, in a number of published articles, authors proclaim the decisive role of antiaircraft guided missiles in destroying an air enemy, while clearly underestimating fighter aviation, which, even at the present time, in our opinion, represents one of the primary means of PVO, especially the antiair defense of troops.

It must be noted that in most cases such statements are made by authors without adequate grounds or concrete analysis of the combat capabilities of all PVO means.

It seems to us that it is fundamentally wrong to single out only one of the combat means in deciding on a system of weapons for the antiair defense of troops. Because any weapon, even the most sophisticated one, always has its weak points which the enemy can exploit to facilitate his own task of overcoming PVO.

Experience of armed combat very strikingly demonstrates the necessity of a harmonious combination of all means of combat, since in this way the most effective use is made of the strong points, and the weak points are compensated for, in each of these means, thus causing them to complement each other.

In this connection, we shall examine the basic tactical-technical characteristics and the combat and operational capabilities of the principal PVO means of a front and try to establish their true significance on the basis of specific calculations and on the experience gained from exercises.

In view of the fact that antiaircraft tube artillery now carries out only a limited number of tasks, namely, directly covering objectives from strikes by low-flying, low-speed

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

IRONBARK

[redacted] 1.3(a)(4)

aircraft and helicopters and also combating airborne landings, we shall dwell on the analysis of combat capabilities of antiaircraft guided missiles and fighter aviation.

Antiaircraft guided missiles (ZUR) are a very effective means of antiair defense. Their probability of destruction of single targets represents an average of 0.80 to 0.85. They are less affected by meteorological conditions than other types of weapons of the PVO troops.

At the same time however, antiaircraft missile complexes possess a number of negative characteristics which reduce their combat and operational capabilities. The first of these is the low maneuverability of antiaircraft guided missile units. Thus, in a situation in which the ground troops are advancing at a rate of 80 to 100 km per 24-hour day, the full complement of guided missile units can participate in covering the troops only when the latter are in the initial position or when they are delayed by the enemy at some intermediate line; and only an insignificant part of the guided missile forces can provide cover in the course of a swift maneuver of troops.

Also contributing to the above situation is the great amount of time required to bring the antiaircraft guided missile complexes into combat and march readiness. For example, it requires 3 to 5 hours to bring a missile complex to combat readiness and 3 hours to dismantle it. Because of the great weight of missile equipment (up to 11 to 14 tons), its extreme sensitivity to road-surface irregularities, its limited capabilities of climbing and descending steep grades and managing sharp curves (the turning radius of a prime mover with a launching mount is not less than 10 meters), the speed at which a mount can be moved at night is only 10 km per hour.

Thus, in view of the high rate of advance of ground troops and the missile complex's limited effective casualty radius (35 to 50 km), the forward elements of troops will advance beyond the ZUR zone of cover every 5 to 6 hours unless the latter can effect a timely advance to new positions. In view

[redacted] 1.3(a)(4)

[redacted]

[redacted] 1.3(a)(4)

of the above-mentioned shortcomings, it is inadvisable to make frequent shifts in the disposition of antiaircraft missile complexes over short distances. While they are deploying to a new position, the ground troops will have advanced an average of 15 to 20 km, i.e., they again will have moved beyond the protective zone of a given missile complex.

Even under the most favorable of circumstances, in which the missile complex is relocated only once every twenty-four hours, up to 19 hours will be required to dismantle, move and set it up. Thus, even under the most favorable conditions the maximum amount of time left for the combat employment of the complex in a 24 hour period is 5 hours. Even with a slower rate of advance by the ground troops, there will be virtually no increase in the time available for the combat employment of missile complexes because of the aforementioned reasons. Consequently, the existing antiaircraft missile complexes essentially are means of protection of stationary objectives; while in operations of fronts they apparently will be used only for the protection of troops in important operational positions, and, most effectively, during lulls in operations.

Antiaircraft missile complexes installed on chassis of assault guns will possess higher maneuver capabilities. However, even this will not ensure a rapid concentration of missile troops in a required area during the course of an operation.

The second important shortcoming of missile complexes which sharply reduces the combat and operational capabilities of antiaircraft missile regiments is the exceedingly great amount of effort spent in the preliminary preparation and checkout of missiles. The productivity of a technical battalion under field conditions is extremely low. Even with well-trained personnel working under favorable conditions, a technical battalion can prepare, with only a checkout of

the complex, a maximum of 20 to 22 missiles in a 24-hour period; while a checkout of missile-borne instruments in their complete program (using two lines) can be done on 10 missiles in a 24-hour period. In view of the fact that a technical battalion is not provided with a reserve supply of missiles, it will be compelled to carry out a full program checkout of missiles received from front and army bases. Thus, an antiaircraft missile regiment will be able to destroy only 5 targets from among the enemy means of air attack in a 24-hour period (on the basis of two missiles for one target), and this under the most favorable conditions and without taking enemy opposition into account.

Another shortcoming of antiaircraft missile complexes that should be mentioned is the fact that they can destroy only those targets flying above 3000 meters. Thus, a situation may develop in which antiaircraft missile complexes will be unable to destroy a large part of the air targets flying at low altitudes. It should also be borne in mind that, because of the characteristics of the methods of detecting low-flying targets, the complexes designated for destroying them have an extremely limited range of fire, and a large number of complexes will be needed to provide adequate protection for front troops.

The combat capabilities of antiaircraft missiles are also reduced because of the lengthy preparation for launching from readiness No. 2. Experience proves that to bring a complex from this condition of readiness to readiness for fire takes 8 minutes if the diesel generators are running or if some other power supply is being used and up to 13 minutes if the diesel generators are turned on when the command is given to prepare the complex for firing. It is evident that the amount of warmup time (passivnoye vremya) is quite great, and in order to have the time to launch a missile at a target flying at a speed of 420 m. per second, it has to be detected at the distance of 245 and 370 km respectively. For example, to destroy a B-47, which has the lowest speed of this class of aircraft, it is necessary to detect it at a distance of 130 and 200 km

[redacted] 1.3(a)(4)

respectively. But since the search and target acquisition radar set, P-12M, detects a medium bomber flying at 20,000 m only at a distance of 240 km and a fighter at 180 km, there is not enough time, as a rule, to prepare the missile complex for firing from the moment the target is detected. Thus, the present antiaircraft missile complex, when in readiness No. 2, does not ensure the destruction of the most probable indicated targets; and when in readiness No. 1, it ensures the destruction of targets flying at speeds up to 1500 km per hour, and has a limited capability against those flying at speeds up to 2000 km per hour. Furthermore, a complex can remain in a condition of readiness for launching only 25 minutes, and at least 20 minutes are required to get the complex ready for another launching.

The short range of fire of antiaircraft missile complexes and the exceptionally high speeds of modern aircraft sharply limit the possibility of timely missile launchings. Thus, a target flying at the speed of 420 meters per second (1500 km per hour) is in the zone of destruction of an antiaircraft missile complex for 67 seconds, and a target flying at the speed of 560 meters per second (2000 km per hour) for only 50 seconds.

A number of the design characteristics of an antiaircraft missile complex limit its capabilities of reliably destroying any type of target. In particular, the destruction of a maneuvering target is possible when its angle of approach up to the moment of impact with the missile does not exceed 55 degrees. For the same reasons there are also prohibited areas at an azimuth of 40 degrees and an elevation of 45 degrees. The presence of a single guidance channel (tselevoy kanal) in an antiaircraft missile battalion ensures simultaneous fire against only one target.

Unquestionably, antiaircraft guided missiles represent a new, effective, and very promising type of weapon. There is no doubt that the continuous process of development and perfection will see an improvement in their tactical and technical characteristics and an increase in their combat capabilities. The antiaircraft guided missiles and controlling radar stations mounted on assault gun chassis, which are now being issued,

[redacted] 1.3(a)(4)

have better maneuverability characteristics than the previous ones, while the creation of missiles with engines that operate on solid fuel will sharply increase their combat readiness. However, because of a whole series of specific characteristics of antiaircraft missiles, which exist in future systems as well, it is our view that we should not expect in the future to be able to concentrate, within short periods of time, their main effort in a required area in the course of an offensive operation and, especially, while an air raid by enemy aircraft and cruise missiles is under way. This is also determined by the short range of fire of missiles, by the comparatively weak protection against jamming, and by large limitations of a design nature in launching the missiles.

In view of all the abovementioned, we are not inclined toward considering antiaircraft guided missile complexes as the principal and decisive force in a system of antiair defense of troops of a front.

We shall examine the tactical-technical characteristics and the tactical and operational capabilities of fighter aviation.

Modern fighter aircraft armed with missiles of the "air-to-air" type also possess a high probability of target destruction (0.8 to 0.9) and can destroy one aircraft or one cruise missile of any type in one attack. Thus, the modern fighter in essence has become a highly maneuverable, flying ZUR launching mount, while retaining its most valuable and most important quality - the high probability of target destruction.

High maneuverability of fighter aviation constitutes its most important quality, which is needed especially in antiair defense, when the initiative in regard to the type of action and time and direction of the strike always belong to the attacker. It is perfectly obvious that only fighter aviation can be concentrated and employed in mass in the course of an air enemy attack that has already begun and at the exact place and time of the greatest danger and threat to the troops

and to the most important objectives of the front. With its long range of fire and by using a wide maneuver, fighter aviation is capable of providing the necessary correlation of forces in a required area to repulse successfully an enemy attack in any sector of a front and on the flanks of cooperating fronts. Ensurance of moving from one airfield to another (aerodromnyy manevr) by aviation along the line of the front does not present any particular difficulties. On the other hand, ensurance of such moves by aviation while following advancing troops at the present high rates of advance presents, just as in moves of antiaircraft missile troops, definite complexities and difficulties. For example, the volume of excavation necessary in the construction of a field fighter base on terrain of average ruggedness is up to 10,000 m^3. One engineer-airfield battalion can prepare such a field in 24 to 48 hours. As is known, the volume of excavation work necessary in the first stage of preparing an antiaircraft missile regiment's siting area is 8230 m^3 and can be carried out in 24 to 48 hours by the forces and means assigned for the work. Thus, the time necessary to prepare field fighter bases and ZUR siting areas is about the same. However, the time necessary to move them to new positions is different, just as the respective ranges of these PVO means differ. Moreover, the solution of the problem of vertical takeoff and landing will give fighter aviation a new quality - operating without airfields, which will immeasurably increase their combat and operational capabilities.

Fighter aircraft is the only means of antiair defense combining within itself the qualities of defense and attack. They can not only repel raids already under way, but can also disrupt them by combined bombing-strafing attacks against airfields and against launch sites for missiles and cruise missiles and by the destruction of enemy aircraft during takeoff and while assuming flight formation.

Fighter aviation is capable of destroying the enemy's radiotechnical means. Two fighters can completely put out of action a guidance radar station of any class or designation. Because of their great range of fire, fighters can destroy

"air-to-surface" missile-carrying aircraft which launch their rockets beyond the effective range of the front's ZUR, as well as, nuclear-weapon-carrying aircraft at distant approaches. Modern methods of aerial, radiotechnical and other types of reconnaissance permit the timely disclosure of the enemy's preparations for take-off or of aircraft already underway and the immediate dispatch of fighters to destroy them.

Until recently, the accuracy in directing fighters and intercepting air targets was not high enough, mainly because of the known physical limitations of combat crew personnel at command posts. With the issue of mobile, automated systems of control, which are now being mastered successfully in units and large units of fighter aviation of air armies, the accuracy of guiding and intercepting air targets is rising sharply, and the combat and operational capabilities of fighter aircraft as a whole are increasing.

Because of automation in the processes of collection, processing and transmittal of data, the warmup time is being sharply curtailed, the lines of interception are being moved toward the enemy, the capabilities for intercepting low-flying targets are increasing, the time necessary for the guidance process is being cut, and the capabilities of simultaneous guidance are being enlarged, as a result of which a fighter division consisting of three regiments with four command posts, using the communication channel for guidance, can simultaneously direct 21 to 25 fighters (groups) against 21 to 25 targets (groups of targets). The arming of fighters with "air-to-air" missiles which permits an air target to be attacked from any direction will greatly increase the capabilities of aviation to destroy the enemy at great distances from the front line. This is particularly important for carrying out intercepts at low altitudes, which at the present time are accomplished behind the front line over one's own territory, because of the limited range at which radar can detect low-flying aircraft and the necessity to direct the fighter against the target aircraft's rear (rear hemisphere-zadnyaya polysfera).

[redacted] 1.3(a)(4)

It should be noted that fighter aircraft operations are dependent upon meteorological conditions to a greater extent than are antiaircraft missile troops. Under normal meteorological conditions, as well as below or behind clouds, and depending on the level of training, the full complement of fighters can participate in repelling enemy aircraft and cruise missiles; while in the clouds at night, only a part of the forces, in planes with radar and infra-red instruments, can participate. Thus, the combat capabilities of fighters to intercept enemy aircraft in the clouds are significantly lessened. In this connection, a continuous process is taking place in the armed forces of equipping air armies with all-weather fighters. In addition, it is necessary to bear in mind the limited capabilities of a probable enemy to deliver strikes from the clouds and at night, since his basic delivery vehicle of nuclear weapons, as has been previously noted, is piloted aircraft.

From the point of view of economics it would be interesting to compare the cost characteristics in the construction of each type of weapon in use.

It is known that the overall material expenditures in creating a combat-ready fighter regiment are significantly higher than for an antiaircraft missile regiment. However, after aviation and antiaircraft missiles have been used three times in combat to achieve a similar combat effect, the economic indices are in favor of aviation equipment. With further frequency of use, this difference becomes even more perceptible.

The experience from World War II, calculations of combat effectiveness and losses of aviation equipment, and taking into account the modern means of counteracting aircraft, show that the average number of missions per plane is between 30 and 50. These data permit aircraft combat means to be classified among the most advantageous from the economic standpoint.

A brief analysis of the tactical-technical characteristics and the combat and operational capabilities of antiaircraft

guided missiles and fighter aviation indicates that both these means have a number of positive and negative sides. Neither antiaircraft guided missiles nor fighter aviation is a universal weapon, guaranteeing the independent achievement of all goals and the solution to all problems of antiair defense of a front. In our view, both of these means should be combined in the front PVO system, complementing each other and reciprocally compensating each other's negative qualities and raising the effectiveness of each. However, the principal role should belong to fighters.

Let us briefly examine several questions relating to the organizational structure of a front's antiair defense.

As is known, control of the antiair defense of a front is the responsibility of the PVO chief of the front ground troops. At the same time, radiotechnical troops and the basic PVO means (that is, antiaircraft guided missiles and fighter aviation) are in the T/O & E of the combined-arms armies, air armies and the front itself. Such a distribution of PVO forces and means between the types of armed forces and arms of troops significantly reduces the effectiveness of their utilization as a whole, since the organization of coordination is encumbered, the necessary efficiency of control is not assured, and serious obstacles are placed in the way of concentrating forces and means and utilizing them expediently. Moreover, the front PVO chief does not have the necessary forces and means to organize and carry out the control of antiair defense.

Control over the basic PVO means is organized in a rudimentary manner and carried out from various command posts: fighter aviation is controlled from the command post of the air army; antiaircraft missile troops are nominally controlled from the command post of the front PVO chief, but actually are controlled from the command posts of the combined-arms armies.

Experience from exercises in groups of forces and in military districts during 1960-1961 completely confirms the

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

indicated shortcomings in the organizational structure of front PVO troops.

It is perfectly apparent that such organizational dispersion and lack of a clear system of centralized control contradict the basic principle of the necessity for mass utilization of PVO forces and means, hinders the development of a clear organizational structure of PVO troops in peacetime, and can lead to grave consequences in time of war.

In our opinion, it is advisable to centralize control over radiotechnical troops, ZUR units, and fighter aviation at the front level. This proposition is in keeping with the general principles for the utilization of combat means and will scarcely cause any doubt.

Naturally, the question arises as to how to organize most advantageously the direction and control over the PVO forces and means of a front. It seems to us that direction and the entire weight of responsibility for antiair defense of a front should be placed on the commander of the air army, according him the appropriate rights (without changing in this connection the direction of PVO in armies and large units). Such a proposal is based on the following reasons.

In the first place, one of the basic PVO means, fighter aviation, is under the direct subordination of the air army commander and, being a versatile weapon, it can be used for a large number of other tasks along with PVO tasks. At the same time, fighter aircraft can most effectively carry out their assigned tasks only when under centralized control and in mass utilization. Therefore, the solution, in which direction of the front antiair defense is carried out by someone else, for example, the front PVO chief, will naturally lead to the splitting up of fighter aviation forces, to decentralization of its control, and, consequently, to a sharp decrease in its combat and operational capabilities. Besides this, the means available in the air army for aerial and long-range radiotechnical reconnaissance can assure a high degree of efficiency in the control over all PVO means and completely satisfy the needs of antiaircraft missile troops (ZRV) for long-range radiotechnical reconnaissance data.

In the second place, a modern air army is mainly composed of fighters and fighter-bombers, which combine the qualities of the means for defense and attack and can, in the course of an operation, and depending on the ground and air situation, switch a significant part of its forces or its entire complement over to carrying out the task of antiair defense of a front or to the support of combat operations of ground troops, or, what will most frequently be encountered in practice, to carrying out both tasks simultaneously.

Along with this, as a result of the dynamism of a sharply and quickly changing ground and air situation in modern operations, it frequently becomes necessary to switch considerable air army forces which are already carrying out PVO tasks over to the support of combat operations of ground troops in exceedingly brief periods of time, even to the point of redirecting aircraft already aloft. Such a situation requires exceptionally efficient control, organization, and maintenance of coordination, which is possible only under strict centralization of control in the hands of the aviation chief alone, who is carrying out tasks of antiair defense of troops and support of combat operations of the front in an operation of all the forces of the air army.

In the third place, the commander of an air army has available to him a control apparatus in the form of a staff which has highly qualified specialists with considerable experience in directing aircraft in carrying out their diversified tasks, including PVO tasks. An air army staff and its command post are equipped with the necessary technical means and have specialized combat teams. Moreover, from the time they were created in the armed forces (1942), air army staffs have been carrying out PVO tasks at the front level, as a consequence of which the transfer of the direction over all PVO of front ground troops to the commander of an air army and his staff would be the logical continuation of a further improvement in the PVO system of a front, assuring the continuity of combat experience and tradition on a modern basis. Thus, the already available control apparatus in an air army, with the necessary T/O & E (command posts) and trained personnel, could

direct the entire antiair defense of a front with insignificant reinforcements of appropriate specialists. There is no similarly prepared apparatus in a front at the present time. Therefore, if it is decided to be done differently, it will be necessary to create a new, special control organ, which will entail the expenditure of large means and will significantly increase the T/O & E. And, what is most important, such a control organ will not be able to direct effectively the use of one of the basic PVO means -- aviation.

In the fourth place, as air armies are equipped with automated systems of control of fighter planes, the capability of intercepting the air enemy will be significantly increased, the time required for the collection and processing of intelligence information on air targets will be sharply reduced, and, with the further improvement of these systems, the automated control of the basic PVO means from command posts of the air army commander will become possible. Naturally, the utilization of an automated system of control also presupposes the unification of all front radiotechnical troops for centralized resolution of the tasks of detecting the air enemy and a sharp reduction in the time necessary for the processing and transmittal of the necessary information to command posts of PVO means, as well as the time required to alert the troops.

In the fifth place, great flexibility and uninterrupted control, with an extensive use of diversified and complex technical means, and the availability of a highly qualified control apparatus familiar with the specific characteristics and features of aviation, are necessary for more complete realization of high maneuverability of front aviation under a sharply and rapidly changing situation.

Thus, the problems of direction and organization of antiair defense of a front can, in our opinion, be successfully solved only if the front has, under the jurisdiction of, for example, the deputy front commander for aviation and PVO, a responsible person who has fighter aviation and radiotechnical means subordinate to him and antiaircraft missile units under his operational subordination. In this case, the most effective and

mass use of each of the combat means, the efficient and precise control over them, and the uninterrupted coordination of all forces in a sharply and quickly changing operational situation will be assured, in accordance with the front troop commander's concept of the operation and his official decisions.

31 MAR 1992

[redacted] 1.3(a)(4)

the pass did not come off as planned (via drop), it would not have come off at all if [redacted] had not decided to take the proper action. 1.3(a)(4)

b. [redacted] had been briefed to gently but firmly take the initiative with regard to the pass 1.3(a)(4) and to maintain it. Unfortunately, [redacted] did not exactly permit this to happen, and instead chose to go into a play which he had used in an earlier encounter with [redacted]. [redacted] had been prepared for this possibility, but we had hoped that [redacted] would be more inclined to follow [redacted] lead on the latter's home territory. We will utilize our two recent experiences with [redacted] to attempt to make our next contact with him a little more certain, if we can.

c. [redacted] was briefed to be alert to the 1.3(a)(4) opportunity to passively collect data as to [redacted] present circumstances and future plans within the context of normal reception chatter. Aside from [redacted] expressed hopes to travel to the US in the indefinite future, nothing of any consequence resulted from the conversation between [redacted] and [redacted]

[redacted]

[redacted] 1.3(a)(4)

2. The floor plan of [redacted] IDEN 1's apartment 1.3(a)(4)
is the same as mine. Considering the circumstances, I would be reasonably certain that [redacted] would see anyone who might be in a position to observe him rendezvous with [redacted] in the particular bathroom used. I therefore am inclined to believe he was not observed.

2. We are pleased that [redacted] and 1.3(a)(4)
IDEN 3 did not repeat their Gold Dust Twins performance of the 4th of July. You will note that Enclosure 1 includes photographs of PETROCHENKO IDEN 3 and samples of his handwriting. Accompanying messages yield no clue as to why.

3. [redacted] reports that GKKNR IDEN 2 officials 1.3(a)(4)
do not particularly like IDEN 1 and that they are now demonstrating a desire to deal directly with him ([redacted]). This is a most promising development and one we shall play in the hope that it will lead [redacted] in the direction we all want to see him go — toward more direct, adequately covered contact with [redacted]

IDEN 5 and IDEN 6

[Enclosure 2 to [redacted] 1.3(a)(4)

1. The exchange of packages between [redacted] and [redacted] took place at the reception given for the Tobacco delegation in IDEN 1's apartment. Present from [redacted] At least Soviet present were all tobacco specialists, except for 1.3(a)(4)
one young man [redacted] does not know, but who met the U.S. delegation at a lunch when the group first arrived and who is presumably a correspondent. He came with the tobacco specialists.

2. The first Soviets to arrive were the tobacco specialists, who came about 1815 (the reception was from 1800 to 2000). [redacted] arrived about 1830, and, [redacted] thinks, he came alone. He 1.3(a)(4)
moved toward [redacted] slowly and they talked
IDEN 6 DANILOVA
for a few minutes with [redacted] and Pete
Julien F. Macdonald MACDONNEL. [redacted] then moved off, and in a few minutes went in and hooked the drop (the package taped to the underside of the water tank cover of the toilet in one of the bathrooms - see below). He came out and rejoined the party from another door, and moved slowly toward the other side of the room, where [redacted] was still talking to MACDONNEL. The three talked 1.3(a)(4)
[redacted] together for a moment and then MACDONNEL moved off to ask someone a question. [redacted] then

[redacted]

said, in English, "I have a small package for you. Do you have something for me?" [redacted] 1.3(a)(4)
answered "yes, yes to the ~~toilet~~ bathroom, through this door and turn right, under the lid of the toilet tank." As soon as [redacted] said "bathroom," [redacted] said "yes, yes." HACDONNEL and Dick DAVIES then approached, and the conversation turned to innocuous subjects. ~~after a few~~.

3. After a few minutes [redacted] said "this is a nice apartment. How many rooms? May I see it?" [redacted] and DAVIES said "yes", and the three moved off, [redacted] leading. As they passed the bathroom [redacted] said "this is the main bathroom." [redacted] went in, looked around, came out, & the three went into the hall, where IDEN 1 was DAMLOVA IDEN 1 showing the apartment. All went into the children bedroom, then out into the hall again, and past the bathroom. [redacted] said "May I use it?, and [redacted] and DAVIES said "of course." IDEN 1 and IDEN 6 by this time moved off, back to the party. [redacted] stood aside to let DAVIES pass, and he said "Go ahead Dick." DAVIES said "I guess he doesn't need any help in there," and moved off. [redacted] was left alone and went into the bathroom with [redacted] and locked the door. [redacted] gave [redacted] the package and said something like "for me," or "you have for me?" [redacted] said "Shh" and pointed to the toilet tank. [redacted] did not

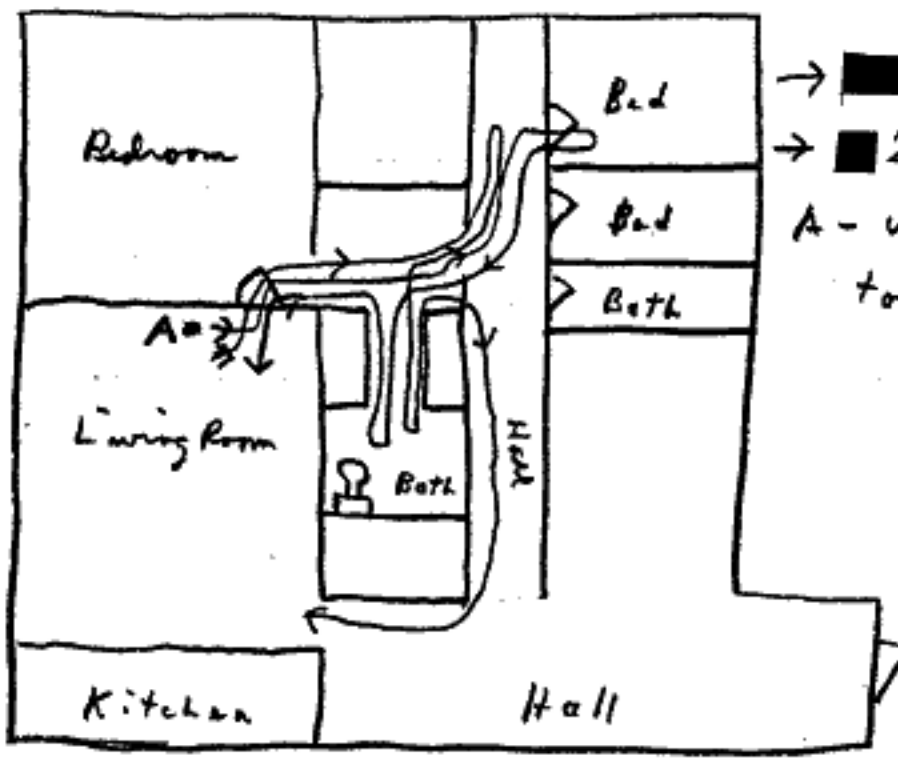
[redacted]

move, as [redacted] took off the lid of the tank, turned it over and put it on the seat, and tore off the envelope and the extra tape which had been left for [redacted] to fasten his package with. [redacted] put the envelopes in his pocket, said "goodbye", and left as [redacted] unlocked the door. There was no one in the hall. [redacted] then relocked the door, flushed the toilet, put the lid back on the toilet, and stayed some 2 or three minutes washing his hands. [redacted] He then opened the door. There was still noone in the hall. He looked back and noticed that two hairbrushes which had been on the lid had been left on the sink. He closed the door, replaced the brushes, and left the bathroom. There was still noone in the hall. He walked back to the group in the living room via the long hallway, and entered the room at the opposite end from which [redacted] had entered when he returned.

1.3(a)(4)

Comment: [redacted] was obviously somewhat nervous, obviously had not gotten the message about the drop, and was in too much of a hurry. As before (4th July) he talked only in English when talking about the operation. [redacted] thinks that [redacted] had his mind set on a pass similar to that used in the past and therefore did not listen to anything beyond where he was told the place of the exchange. [redacted] does not think any of this was apparent to anyone else, however

1.3(a)(4)



there were others
he looked to see if
[redacted]

[redacted] does not know of, during the past, the water faucet was turned on. It was on after [redacted] left, and [redacted] does not recall turning it on. In any case, it runs quietly. [redacted] remarks in the bathroom were made in a very low voice after the exchange 1.3(a)(4)

4. [redacted] returned to the room at exactly 1900. The rest of the evening was without incident. LEVIN IDEN 4 PETROCHENKO and IDEN 3 did not arrive till 1930. [redacted] talked many times with all the IDEN 2 people at the reception. All were in the best of spirits, including even [redacted]. They all left about 2030.

5. While talking to [redacted] and [redacted] said "We (two) will come to America." IDEN 5 [redacted] said "When? We will welcome you there"; [redacted] said cheerfully "sometime, sometime". He then said IDEN 5 "the [redacted] is my best friend." ULYANENKO

COUNTRY : USSR

SUBJECT : MILITARY THOUGHT (TOP SECRET): "The Tasks of the Navy and the Methods of Performing Them", by Admiral N. Kharlamov

DATE OF INFO : December 1961

APPRAISAL OF CONTENTS : Documentary

SOURCE : A reliable source (B).

Following is a verbatim translation of "The Tasks of the Navy and the Methods of Performing Them", an article by Admiral N. Kharlamov.

This article appeared in the 1962 First Issue of a special version of the Soviet military journal Voyennaya Mysl (Military Thought). This journal is published irregularly and is classified TOP SECRET by the Soviets. The 1962 First Issue went to press on 29 December 1961.

Headquarters Comment: Military Thought is published by the USSR Ministry of Defense in three versions, classified RESTRICTED, SECRET and TOP SECRET. The RESTRICTED version has been issued monthly since 1937, while the other two versions are issued irregularly. The TOP SECRET version was initiated in early 1960. By the end of 1961, 61 issues of the SECRET version had been published, 6 of them during 1961.

The Tasks of the Navy and the Methods of Performing Them

by

Admiral N. Kharlamov

The tasks of the Navy in a future war are a subject of theoretical as well as practical significance to the entire Armed Forces. There is still lacking the necessary unity of understanding among the command elements of the various types of Armed Forces regarding the role, place and significance of combat operations at sea, especially in the initial period of a war.

In the article by Admiral V. Platonov[1], the tasks which may be assigned to our navy in a future war have been examined in the main, correctly. However, these tasks are spelled out in general terms and are applicable to a war as a whole, with no consideration for the specific conditions of its initial period.

And yet, the nature of naval forces operations, the substance of the tasks being performed, the degree of their importance, and the sequence of their execution will differ greatly in the initial period of a war from the execution of these same tasks during subsequent periods of a war.

It is a universally recognized principle that the initial period of a war will have a decisive influence on the subsequent operations of each of the opposing sides. Obviously it is during this very period that both of the opponents will strive to use the greatest possible part of their nuclear/

1.3(a)(4)

missile power amassed during the many years of peace. Here, from the very beginning of the war, a fierce struggle will be carried on to ensure the opportunity to use to the full the most powerful means of destruction available, or, as we say, the struggle for the strategic initiative.

The main point of this struggle for our Armed Forces will be to frustrate the enemy attack, deny him the opportunity of carrying out previously developed plans for the initial operations, and from using means of mass destruction readied in advance, and, at the same time, to deliver such a powerful strike against the enemy that it would appreciably reduce his capability to conduct subsequent combat operations.

The decisive role in the delivery of such a strike will belong to the missile troops of strategic designation, which are capable of hitting at the most vital enemy strategic objectives located on any of the continents.

A significant part of the efforts of the Armed Forces will have to be expended for the destruction of such delivery vehicles of the enemy's nuclear/missile weapons as missile atomic submarines, carrier strike large units, and groupings of surface missile-carrying vessels, which are not only capable of delivering strikes at our coastal installations, but can also operate against interior areas of the country. The first strike against these forces of the enemy must also be delivered at the very beginning of the war, and must be calculated to take place before the enemy can fully use the capabilities available to him.

In contrast to the objectives of strikes by the missile troops which are stationary--thus permitting prior determination of all the necessary data and the creation of a grouping of forces for delivering

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

a strike against them at any moment, naval targets have a very high degree of mobility. Therefore, for combat with enemy naval forces it will be necessary also to bring in mobile forces which have at their disposal the necessary nuclear/missile power. The only force actually capable of frustrating the first enemy strikes from the sea continues to be the Navy, and its basic task in the initial period of a war is to frustrate the nuclear/missile attack in the course of the enemy's so-called "all-out nuclear offensive" from the sea.

Just as the missile troops, by their first strikes against objectives on enemy territory, will destroy those of his means of carrying on a nuclear/missile war which are located on land, so the forces of the Navy will have to perform this task at sea.

This is why the basic and primary task of our Navy in the initial period of a war will be to destroy the forces of the enemy navy, which, along with other forces, comprise the basis of his nuclear/missile power. The first strikes of our fleet should be directed against such objectives as, above all, missile submarines, carrier strike large units, and groupings of missile-carrying vessels at sea or in bases.

The destruction of the strike forces of the enemy navy should be carried out within the framework of one or more initial operations. Operations against the enemy forces will have a single goal, and will be carried out simultaneously and according to a single plan. In connection with this, combat with aircraft carriers, missile submarines and groupings of surface vessels will be appropriate individual tasks of this overall operation. It will be carried out by specially constituted groupings of forces which will deliver strikes against enemy naval forces in the areas of basing, under way at

[redacted]

1.3(a)(4)

IRONBARK

[redacted]

1.3(a)(4)

sea, and directly in the areas of combat operations.

If the task of frustrating the enemy's nuclear offensive from the sea is successfully accomplished, it will have a direct and substantial influence not only on subsequent combat operations at sea, but on the course of combat operations along certain strategic axes. Therefore, in order to destroy the strike forces of the enemy navy at the very start of the war, it is necessary to allot sufficiently large forces, even to the detriment of the performance of other tasks, so that the first strike against the enemy is the most powerful. Only in this way can we be certain that the enemy will be incapable of parrying our strike, and that it will therefore be highly successful and bear important results.

Up to the present time, authors of many articles and scientific works, as well as the author of the article presently under discussion, maintain that such a naval task as disrupting enemy sea and ocean communication lines must also be accomplished in the initial period of a war. Moreover, Admiral V. Platonov writes that "combat with carrier strike large units on the ocean.....is only part of the task of disrupting the enemy ocean routes of communication, though it may be the most difficult part".

There is no need to argue the point that the destruction of the main strike groupings of enemy naval forces will facilitate the operations of our naval forces against the ocean communication lines of the enemy. The issue lies elsewhere--should combat against enemy communication lines be carried out simultaneously with the operations to destroy the main strike forces of the enemy navy; will it be justified to allot for this purpose a considerable portion of the forces to the detriment of the accomplishment of the main task of the initial period of the war---frustrating the enemy nuclear attack from the sea.

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

IRONBARK

[redacted]

1.3(a)(4)

There is no doubt that the disruption of ocean communication lines and interruption of enemy sea transport will have considerable bearing on the course of combat operations in all theaters, but the effect will not be felt immediately; it will become evident gradually, as the materiel prepared by the enemy in advance becomes expended and his armed forces begin to suffer seriously from lack of ammunition, fuel, materiel and personnel. It will take at least several months before such a situation is reached, i.e., after the first operations have already been completed.

Our probable opponents are amassing the required supplies of materiel in the theaters of military operations at a rate which, taking losses into account, will ensure the conduct of combat operations for a period of 3 to 4 months.

Due consideration must also be given to the fact that at the present time certain changes are taking place in the thinking of the probable opponent regarding the system of protecting his sea and ocean communication lines. Aware of the fact that ocean and sea ports will become targets for nuclear strikes in the initial period of a war, the NATO military command now considers that one of the priority tasks in the initial period of a war is the withdrawal of their merchant ships from the areas of nuclear strikes in order to preserve them for carrying out heavy shipments in the subsequent period of the war.

This task was executed in practice at the strategic command-staff exercise of the NATO Armed Forces, "Side Step", in 1960. During the exercise, within 48 hours after the beginning of military operations, almost all ocean-going vessels, with the exception of those in mothballs or undergoing repair, were withdrawn from major European ports and from the Atlantic coastline of the United States.

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

IRONBARK

1.3(a)(4)

[redacted]

Of 2242 vessels originally located in 68 major ports, 2002 were evacuated. Only 190 remained in European ports, and approximately 50 were left in U.S. ports. Those merchant ships which were at sea at the time were also directed to the western part of the Atlantic Ocean.

The ships were evacuated in convoys as well as individually. In all, 33 convoys were recorded in 5 days, each consisting of 10 to 45 transports; in this instance protection for the majority of the convoys consisted of 1 to 3 escort vessels. Six convoys proceeded with no protection whatever. During the same period records show that there was only one convoy departing the United States for Europe; it consisted of 13 vessels and was escorted by 6 war ships. The majority of the merchant vessels--approximately 66 percent-- were evacuated to ports of North, West and South Africa. The remaining vessels were directed to the area of the Gulf of Mexico and the Caribbean Sea.

Such operations of the enemy corroborate once more that in the initial period of a war major movements of troops and freight from U.S. ports to the European Theater of War are not very likely.

Also, although the destruction of the transports while they are in process of evacuation will decrease the enemy's capabilities to organize subsequent sea shipments, it will have no direct influence on the course of combat operations in the naval and ground theaters in the initial period of a war.

If small convoys are detected delivering troops across the ocean to the European Theater of War, their destruction can be incidental to the accomplishment of the basic tasks.

Such is the situation regarding operations against enemy ocean communication lines in the initial

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

IRONBARK

[redacted]

1.3(a)(4)

period of a war.

We cannot rule out the possibility that in the first days of a war, our probable opponent may begin transporting troops by sea along coastal communication routes for the purpose of regrouping, reinforcement or evacuation of groupings pushed up against the sea, or for delivering materiel to them. Such operations are likely to take place in both the closed sea and ocean theaters of military operations. Such enemy sea transport will become the objective of operations of the inshore (blizhneye deystviye) naval forces, including missile-carrying surface vessels.

The main efforts of the Navy in the initial period of a war must be concentrated against the strike forces of the enemy navy. Atomic and missile submarines and missile-carrying aviation should be directed first of all at the destruction of those forces of the enemy navy which deliver nuclear/missile weapons. At the same time, and incidental to this, the task of disrupting enemy sea communication lines also will be accomplished in part. By destroying enemy naval bases and ports, the Navy will also destroy the transports and freight standing in them.

Although the task of disrupting sea communication lines and frustrating enemy sea transport is one of the main tasks of the Navy in the initial period of a war, it must be executed, in full scope, only after the nuclear/missile power of the enemy strike groupings has been undermined considerably, and his forces have lost the capability to deliver concentrated strikes against our Navy and its basing areas as well as against the rear area installations of our country.

In order to set up successful combat with enemy sea transport, prevent reinforcement of his ground

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

IRONBARK

[redacted]

1.3(a)(4)

troop groupings in the course of the first operations, cut off delivery of essential materiel, and frustrate the evacuation of valuable materiel from Europe to the other side of the ocean, it is necessary to take all possible measures for annihilating his carrier strike large units and destroying his missile submarines. This task must be executed by the fleet in coordination with the missile troops of strategic designation, and will make it possible, in a short time, to weaken enemy naval forces in the theater and will release our submarines and missile-carrying aviation for operation against enemy distant ocean communication lines.

At the time that large units of missile troops, while delivering strikes against vital objectives on enemy territory, including ports and naval bases, also are destroying the ships located therein, the navy will engage in combat with carrier strike large units, enemy missile submarines and their supporting forces directly at sea, destroy aircraft carriers, missile-carrying vessels and atomic submarines in the areas of their combat operations and on the approaches to them. Part of the naval forces will deliver strikes against the basing areas of the antisubmarine forces, airfields of antisubmarine defense (PLO) aviation, communications centers, control centers and the more important means of radiotechnical surveillance and navigation in the sea theater.

Regarding the actual methods of naval forces operations for destroying enemy carrier strike large units, in this matter we share the point of view of Admiral V. Kasatonov[1], and cannot accept as well founded the estimate of Admiral V. Platonov regarding the capabilities of our fleet in the

execution of this task, nor the evaluation of the exercises conducted to work out the methods of naval forces operation against enemy carrier strike large units.

Admiral V. Platonov writes as follows regarding one of the exercises of recent years: "It was artlessly and sketchily conceived, and carried out in a simplified manner". The actual case was somewhat different. This Pacific Fleet exercise was one of the first major exercises in which the operations of our forces were carried out at a great distance from their bases, that is, in those areas where enemy naval forces may be engaged in operations in a future war. The forces representing the simulated enemy carrier strike force (AUS) were deployed through the Korean Strait and proceeded to the east of Japan, to a distance of a few hundred miles. For operations against them, the submarine forces of the Pacific Fleet were deployed southeast of the island of Hokkaido. Aviation from the area of Sovetskaya Gavan delivered strikes against war ships at sea. Thus, in this exercise, simulation of the operations of forces was brought to a minimum.

During the exercise, only one version of the operations was played, and the most difficult one at that--when the carrier strike large unit is deployed within the operational area of aviation from remote bases, located in the Hawaiian Islands. In this version our navy will have less time for organizing a strike. Organization of reconnaissance and target designation will be particularly difficult in such a case.

If, however, the strike carriers are relocated (deployed) to bases in Japan, prior to the initiation tion of combat operations, and their aviation takes off directly from the bases for the strike, as Admiral V. Platonov writes, then the task of annihilating the carrier strike force can be achieved in the

[redacted]

1.3(a)(4)

IRONBARK

[redacted]

1.3(a)(4)

overall plan for destroying coastal objectives, and will be considerably easier than under conditions of carrier strike force operations in remote regions of the ocean.

It is obvious that in the course of operational training, different versions of naval forces operations may be worked out. As is generally known, during the Pacific Fleet exercise the concept and plan of naval operations envisaged action against objectives located on the mainland and on enemy island bases, as well as strikes against carrier strike forces on the ocean. For this purpose it was planned to use aviation, shore missile units and a unit of submarines. However, for obvious reasons, strikes against the bases and against objectives of the probable enemy located on shore could not be worked out in practice.

Admiral V. Platonov is in favor of eradicating simplification and sketchiness in the operations of the naval forces while they are working out methods of executing combat missions on the ocean in the process of naval training. Such a requirement is obligatory, and in order to fulfill it, much effort is needed on the part of the teachers and the pupils in all exercises conducted in the Navy.

However, it must be mentioned here that a tremendous gulf sometimes exists between requirements and capabilities of fulfilling them, and the fight against simplification in combat training can be carried on up to specific, sane limits, which, under present conditions, it is impossible to exceed.

Before, when the main weapon of a war ship was artillery, and that of aviation--torpedoes and conventional bombs, delivery of strikes against groupings of ships could be simulated by the actual use of the weapons against special targets, or even against combat vessels. True, even then full use could not be made of all the means of defense and protection of a ship repelling the strikes of

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

IRONBARK

[redacted]

1.3(a)(4)

"the enemy". Therefore, even at that time, concentrated strikes, combined attacks and single round firings on ships appeared far from what it would be in an actual combat situation.

Now, when missiles and torpedoes with nuclear charges are becoming the main weapons of war ships and aircraft, carrying out even a small number of experiments with the actual use of weapons is far from being always possible, and it is questionable whether the results attained would justify the use. The cost of the weapons, measures for ensuring security, the great expenditure of forces which would be allotted for this purpose, and other circumstances would require an even greater amount of simulation in the operations of the naval forces during combat training than is permitted at the present time without the actual use of weapons.

Nevertheless, even now, as more and more missiles of various designation are being used for naval armament, it is becoming difficult to find a naval exercise in which there is no actual use of missiles by submarines, aviation and surface vessels. It is true that, for obvious reasons, missile launchings at present are carried out at firing ranges, and not against vessels and aircraft participating in an exercise. From this point of view, some of our exercises are simulated to a certain degree, and the operations of naval forces in these exercises are conducted in oversimplified conditions, different by far from those in which even the first combat of a future war will be conducted. This is done because we still have not created perfected targets and means of simulating missiles which would permit us to work out their launchings effectively; thus, out of necessity, we have to use missiles only on special firing ranges, and not directly during the playing of tactical phases--the attacks and strikes of mixed forces.

IRONBARK

[redacted]

1.3(a)(4)

And although atomic and hydrogen bombs are not exploded at the exercises, and the piercing whistle of cruise missiles is not heard over the war ships, everything else--from the deployment of forces and the organization of strikes up to going into the attack using training torpedoes and various means of simulation--is carried out just as it will be under combat conditions. Therefore we cannot agree with the assertion that oversimplification in combat training and in the organization and conduct of exercises, and stereotyped use of forces, are prevalent in the Navy. As is generally known, our Navy broke away from the shore just a few years ago, and the main areas of its combat training became those seas and ocean regions which would most likely be used by the naval forces of the enemy in a future war. These areas are quite distant from our bases, airfields and coastline, and this fact in itself brings the conditions under which our naval forces will operate nearer to actual wartime conditions. In these areas submarines and missile-carrying aviation develop and check out in practice the most effective methods of operations and the use of their weapons in a complex situation.

At the exercises, in accordance with the particular situation, submarines are deployed in appropriate groupings in the most probable areas of operations of enemy carrier strike large units. In order to simulate the operations of the "enemy", war ships usually go out to sea and carry out operations in accordance with the views of the military leadership of the NATO countries which are known to us.

In exercises of recent years, the first strikes against the "enemy" war ship groupings were delivered by those forces which were the first to arrive in the area of "enemy" operations--in accordance with the principle "no one waits for anyone". In a number of instances the first to use their weapons

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

IRONBARK

[redacted]

1.3(a)(4)

were the large units of missile-carrying aviation. There were also cases when the first strikes against the "enemy" were delivered by submarines. Later the naval command usually strived to direct as many submarines as possible at the "enemy". Repeated strikes by aircraft completed the annihilation of his war ship groupings.

One of the shortcomings of exercises is that the simulated forces are not fully used in them. Their function is limited to that of simulating the enemy up to the time that submarines and aviation deliver a series of nuclear strikes against him. As soon as the naval forces execute the task of annihilating the enemy strike groupings the simulating forces return to base.

In a majority of the exercises conducted, not all of the submarines had time to attack "the enemy", and often began to return to base, on signal, without having made even one attack. Thus, although the exercises were instructive for the Navy on the whole, and permitted it not only to check out, but to perfect, the methods of operations of submarines and aviation, for those submarines which did not succeed in attacking "the enemy", the prolonged stay at sea, in essence, represented a routine, and not a combat, cruise.

We consider that all submarines proceeding to remote areas should have a chance to conduct at least a few attacks on the "enemy" in the ocean. This can be ensured comparatively simply. After the main tasks of the naval exercise are carried out, it is advisable to conduct the simulated forces, deliberately, through those areas where, toward the end of the exercise, our submarines are located. This will create the necessary conditions for working out the operations of submarines in remote areas of the ocean, and will provide opportunity to carry out a series of attacks under realistic conditions. The latter is necessary for the moral satisfaction of the

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

IRONBARK

[redacted]

1.3(a)(4)

submarine personnel, whose intense training during a cruise should be concluded by an attack, as it will under combat conditions.

The simulation forces should be used to the utmost in working out such matters as combat use of naval shore missile units, missile and torpedo patrol boats (kater) and various means of combat, in order that each naval exercise would actually be Navy-wide, and all the large units and units would have a real opportunity to conduct attacks against the enemy, thus bringing to a logical conclusion the long period of maintaining them at combat readiness.

One cannot but express amazement at the assertion of Admiral V. Platonov that "control of naval forces is presently undergoing a crisis" and at his proposal to unravel some "knot of contradictions".

Does everything regarding the control of the naval forces actually seem to be as it is pictured in Admiral V. Platonov's article? We are very far from accepting these extreme opinions and pointed conclusions as being fair.

If the logic of Admiral V. Platonov's reasoning is followed, when he suggests that there be two commanders of the naval forces--each independent of the other--the question automatically arises--why only two? If our Navy is carrying out an operation for the destruction of enemy naval forces, the forces of the former will be conducting operations along several axes, executing independent tasks. Part of the forces will carry on combat with carrier strike large units, another part will hunt out atomic submarines and destroy them, and part will perform tasks for the destruction of ports. and naval bases, and for putting out of commission the ships and vessels located therein. To this we must add that in order to support the operations of their groupings of

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

IRONBARK

[redacted]

1.3(a)(4)

strike forces, and also for the defense of the system of basing and for the execution of the greatest number of tasks by way of systematic combat operations, special forces will be needed which, at the present time, are the forces of naval bases and divisions (brigades) of the inshore defense (OVR - okhrana vodnykh rayonov). All these groupings will operate in different areas of the theater, their methods and duration of operations will vary, and the groupings will differ from each other in the composition of forces.

In other words, it turns out that for each grouping of forces engaged in executing one of the tasks of the operation, it will be necessary to have a commander of forces, who will be, in the opinion of Admiral V. Platonov, one of the independent commanders of the fleet. But since all these forces will execute their tasks in coordination, and organizationally are united into one Navy, it will be necessary to have still another naval commander over all the other commanders. Such an "improvement", in our opinion, would not lead to better control of the naval forces, but would indeed give rise to a crisis.

It is necessary to search for ways of improving the system of control of forces, not by increasing the number of commanders of each fleet, but in wide-scale automation of all the work of the command and staffs. At present this is the most correct and promising path, which, if followed, will open up great possibilities for ensuring dependable, uninterrupted and flexible control of all naval forces, operating in different areas of the theater and executing various tasks. And when the electronic-computing equipment takes its proper place in the work of our headquarters, it will fully assure the capability of a single commander to control all the forces while they are operating in any ocean areas.

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4

IRONBARK

[redacted] 1.3(a)(4)

The dismal picture painted by the author of the resubordination of part of the forces of one fleet to another while both are executing the same task, is far from the actual true situation.

Actually, when two fleets jointly fulfill the same task, we work out the transfer of part of the forces of one fleet to the subordination of another. This means that the attached or supporting forces are being used together with the basic forces of the fleet which were allotted for the execution of a single task. They are under the direction of one of the fleet commanders designated by the Commander-in-Chief of the Navy.

Experience gained in exercises has indicated that such use of the forces of two or more fleets for the execution of the same task fully justifies itself, and none of the awful situations with which the author attempts to frighten us has developed. And anyway, under present conditions, the development of such situations is impossible. The forces of one fleet are attached to another, not for operating in a specific area, limited by one of the parallels, but for the performance of a definite task. And only after this task is executed---regardless of whether it is below or above the 50° parallel, the attached forces can be redirected and consequently become resubordinated to the other commander.

Such resubordination is nothing to shy away from, but it should be worked out and mastered in the process of combat training, because this is one of the possible workable means of concentrating the efforts of two or more fleets for the execution of important tasks in short periods of time.

[redacted] 1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

IRONBARK

[redacted]

1.3(a)(4)

Equally unfounded are the author's misgivings that the war ships operating near the boundary lines will not know to whom to report and whose orders to follow. This will not happen if the tasks are clearly assigned. We cannot seriously consider that the commanders of submarines being deployed several thousand of miles away from their bases will not know why they were sent there. Neither will they be required to report to various addresses regarding their operations, because we have adopted and operate on a unified system of communications for all fleets. And finally, we must bear in mind that the boundary lines between the zones of operations of adjacent fleets are fixed by the high command, which, in assigning a task to the fleets, defines the areas of their operations, and at any given moment, just as soon as needed, can shift the boundary line as required by the actual situation.

In a number of instances Admiral V. Platonov overestimates the capabilities of the probable opponent. He writes that if "... the situation forces the enemy to sally forth into open sea to deliver a strike, then the carrier strike large unit will see to it that a thorough preliminary search is carried out and that the area of its maneuvering is cleared of enemy submarines". We can hardly agree that the enemy will be able to destroy our forces completely in one or another area even before the accomplishment of the combat task. However, if the author of the article thinks otherwise, then he should not only have described this situation, but also offered some way out of it.

We are of the opinion that our forces are capable of operating in remote areas of the ocean and successfully accomplishing the task of destroying carrier strike large units.

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted] 1.3(a)(4)

IRONBARK

[redacted] 1.3(a)(4)

Also incorrect is the assertion of the author of the article that we still have not determined the main forces for the task of combat with missile submarines.

It is known that already in 1957, in connection with the accelerated construction by the United States of atomic submarines. armed with "Polaris" missiles, and the possibility of their being used from the ice areas of the Arctic, the Navy was assigned a new task--to prevent these submarines from delivering strikes against our territory. Special measures were taken for the most rapid construction of special antisubmarine defense (PLO) forces, as well as for working out the use. for this purpose. of the forces and means which were already part of the equipment of the fleet.

The fleets and academies were assigned the task of giving special attention during operational and combat training, and while conducting scientific research, to finding effective methods of combat with missile submarines. As a result of this, at the present time a system of antisubmarine defense has been worked out, as well as opinions regarding the performance of its tasks.

It is felt that combat with missile submarines is to be carried out with equal intensity in both close and remote areas. It will consist of strikes against missile submarine bases, the mining of their basing points, and destroying them in remote areas, prior to their approach to firing positions.

Admiral V. Platonov correctly affirms that the main force of the Navy in combat with missile submarines will be antisubmarine submarines. However, absolute denial of the capabilities of aviation and surface vessels in this combat must be considered incorrect. In the next few years surface

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4

IRONBARK

[redacted] 1.3(a)(4)

vessels and PLO aviation will comprise the basis for combat with missile submarines in coastal areas. These forces will also have a definite role in remote areas.

In Admiral V. Platonov's article we come across other incorrect propositions. We fully agree with the criticism of them expressed in the article by Admiral V. Kasatonov.

The editors of the periodical "Military Thought" acted correctly in organizing a discussion of the most important issues of the development and use of the Navy in a future war. A broad exchange of opinions by the command personnel of the Navy and other types of Armed Forces on the issues touched upon will permit us to understand more deeply the significance and substance of the changes taking place in our Navy, caused by the adoption into its armament of nuclear/missile weapons and various combat means based on radio-electronics, and to work out unity of views on all the basic issues of the development and use of naval forces.

COUNTRY : USSR

SUBJECT : MILITARY THOUGHT (TOP SECRET): "The Role of Space Weapons in a Future War" by Lieutenant-General N. Korenevskiy

DATE OF INFO : December 1961

APPRAISAL OF CONTENT : Documentary

SOURCE : A reliable source (B).

Following is a verbatim translation of an article entitled "The Role of Space Weapons in a Future War", by Lieutenant-General N. Korenevskiy.

This article appeared in the 1962 First Issue of a special version of the Soviet military journal Voyennaya Mysl (Military Thought). This journal is published irregularly and is classified TOP SECRET by the Soviets. The 1962 First Issue went to press on 29 December 1961.

Headquarters Comment: Military Thought is published by the USSR Ministry of Defense in three versions, classified RESTRICTED, SECRET and TOP SECRET. The RESTRICTED version has been issued monthly since 1937, while the other two versions are issued irregularly. The TOP SECRET version was initiated in early 1960. By the end of 1961, 61 issues of the SECRET version had been published, 6 of them during 1961.

The Role of Space Weapons in a Future War

(According to foreign views)

by

Lieutenant-General N. Korenevskiy

The space weapons which are coming into existence at the present time attract the intense attention of the government and military figures of the main capitalist countries.

The first leap into space, accomplished by our country on 4 October 1957, naturally presented the question of the paths to the mastery of space, the means necessary for this, and the primary goals to be pursued in this.

On the one hand, as was stressed in the speech of the President of the USA on 25 May 1961, thus began the "battle for men's minds" in which the United States strives for "great enterprises" capable of demonstrating to the entire world the capabilities of the country and its science and technology. In his speech Kennedy gave American science and technology the task of "achieving the flight of a man to the moon and his safe return to earth by the end of this decade." In his opinion, "not a single space venture of this period will be more exciting, impressive or important for the overall exploration of space nor so difficult or expensive." In order to achieve this goal he has already requested an additional appropriation of 531 million dollars for the 1961-62 fiscal year, having warned that in future years even more resources will be required. The total cost of the program of conquering the moon is estimated by the Americans to be about 40 billion dollars.

On the other hand, the beginning of the conquest of space gave an impetus to its study for purely military

[redacted] 1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

IRONBARK

[redacted] 1.3(a)(4)

purposes, in which the space nearest to the earth is viewed simply as the arena of future battles.

This article represents a first attempt to state, in a systematic manner, the views of the American command on the role of space weapons and the possibilities for employing them in combat. The article does not pretend to be a complete elucidation of all questions connected with this subject. However, the information cited by us below attests to the need for serious study of the space weapons of the USA, the plans and intentions of the American command, and the possibilities of utilizing space devices for military purposes. The need for such a study is explained by the fact that, for some time now, work in this field has gone beyond the limits of purely scientific investigation; it has a very definite military nature and is being given very serious attention by the highest American echelons, including even the President of the USA.

The ballistic missile proved to be the first means of attack through space and, even though, in itself, it does not relate to space weapons, its appearance caused the need to develop a series of purely space weapons systems. Special reconnaissance earth satellites have been recognized as the best means for detecting launching sites and launchings of missiles. The exact tie-in of the geodetic networks of the various countries and continents, which is necessary for determining the coordinates of such targets, proved to be feasible with the aid of special satellites that can be observed simultaneously by optical and radiotechnical means from points which are within the networks being tied in. One of the basic tasks of so-called scientific satellites is to define more precisely variations in the gravitation of the earth, i.e., to produce the data

[redacted] 1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

IRONBARK

[redacted]

1.3(a)(4)

necessary in preparing to fire intercontinental ballistic missiles. Artificial earth satellites--meteorological, radio reconnaissance, and communication--have been recognized as means capable of providing meteorological reconnaissance, radio reconnaissance and communications on a global scale.

Numerous projects for space systems for delivering strikes against ground targets, and for antimissile and antispace defense, appeared soon after the space support systems. The special significance of space weapons is also explained by the extreme difficulty of destroying space vehicles.

In confirming the adherence of the new administration of the USA to an aggressive policy, President Kennedy, in his special message of 28 March 1961, stated that the American government must have at its disposal strategic attack and defense weapons adequate to forestall any premeditated attack on the United States. In this connection, special attention is given to weapons launched from concealed, mobile, or invulnerable bases that will not be wiped from the face of the earth as a result of a surprise attack. Space weapons belong to this very category of weapons.

Until the recent past a special role in military strategy was allocated to the Air Force. However, in 1959 the American command had already included aerospace in the operating zone of its Air Force and announced the creation of the so-called aerospace forces. The aerospace forces are considered to be the fundamental U.S. strategic means, and include aerodynamic craft (airplanes and cruise missiles), ballistic missiles and military space devices. The basic principles of employing aerospace forces to achieve the goals of the American government are stated in the so-called Basic Aerospace Doctrine of the U.S. Air Force.*

*United States Air Force Basic Doctrine (Aerospace Doctrine). U.S. Air Force Manual AFM 1-2, 1 December 1959. Translation from the English, GRU Main Staff, Moscow, 1960.

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

The aerospace forces are intended for operations in the total expanse beyond the surface of the earth without any limits in altitude. This expanse is considered to be, from the military standpoint, indivisible, and is called aerospace. According to the plans of the U.S. Air Force, made for a 15-year period (until 1975), the zone of combat operations in space will extend to altitudes of about 130,000 kilometers.

Aerospace forces are capable of operating anywhere and at any time. They have an unlimited range of operation, high mobility, great speed and firepower, and are capable of overcoming enemy defenses and conducting combat operations both in the atmosphere of any part of the globe or beyond the limits of the atmosphere.

Aerospace forces can conduct combat operations independently or in cooperation with other types of armed forces.

The most important principles in the employment of the aerospace forces are considered to be the principles of indivisibility and centralized control of forces, clarity and definitude of the task assigned to them, maximum display of initiative in all operations, concentration of efforts, insuring security, and close cooperation with other types of armed forces and with civilian and government components. The significance of the principle of surprise, which is acknowledged to be the determinant, is especially stressed, and every effort is to be made to attain it.

In a future general war, aerospace forces are given the decisive role. Therefore, attaining superiority in aerospace is made one of the most important tasks. It is maintained that "In general war the ultimate outcome would be a result of the decision in the aerospace battle at the outset"*

*United States Air Force Aerospace Doctrine, p.21. /This page number apparently refers to the Soviet translation of the manual. The quotation is taken from page 13, paragraph 2 of AFM 1-2./

[redacted]

1.3(a)(4)

IRONBARK

[redacted] 1.3(a)(4)

and supremacy in aerospace is already manifested in a capability "to destroy the military might of the enemy and concurrently protect the security of the United States of America and its allies."* The aerospace forces are capable of acting against the elements comprising the enemy's might, and, by having supremacy in the aerospace, they obtain advantages for all other types of armed forces in their performance of the tasks before them.

Bearing in mind these basic tenets of the American aerospace doctrine, let us now examine the question of supremacy in space and the role assigned to space weapons in a future war.

The significance that is attached to attaining supremacy in space was best expressed by the present President in 1960 when he was still a U.S. senator: "Supremacy in space will be the substance of the next decade. The nation that controls space will also control the world," Kennedy said then.** This assertion is consistent with the thesis of the aerospace doctrine, in accordance with which the ultimate outcome of a future war will be decided by combat operations in the aerospace.

The concept of supremacy in space differs from the earlier concepts of supremacy on land, on sea, and in the air.

In the opinion of the Americans the policy of supremacy is portrayed most vividly during combat operations on land. During combat operations on the sea, and especially in the air, this concept already has a limited application. Even greater limitations arise in its application to space. If the atmosphere ends at the maximum flight altitude of aerodynamic aircraft, then space is limitless and open for all countries. Even in that part of the aerospace closest to the earth, the possibilities for supremacy are considerably

*Ibid, p.19. /Page 10 of AFM 1-27

[redacted] 1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

IRONBARK

[redacted] 1.3(a)(4)

less than on land, on the sea or in the air.

However, supremacy in any environment remains as an ideal in the strategic concept by which one must be guided. Time and place become the basic factors under these conditions. In the opinion of General Power, the former Commander of the Strategic Air Command, "the existing concept of conducting combat operations in three dimensions of space will expand in time, if it can be expressed in this way, into the concept of conducting combat operations in four dimensions of space, combat operations in which the operational correlation between space and time will become the decisive factor."

In general, if it is impossible to control the entire aerospace in order to deprive the enemy of the capability to use it for his purposes, it is then necessary to resolve the simpler problem of controlling a certain part of it at a certain time. One of these most important parts is the aerospace directly surrounding the earth and extending to an altitude approximately equal to one radius of the earth. In the opinion of the U.S. military command, the significance of space combat operations, in a future war, will be determined by their influence on the combat capabilities of the enemy's ground forces and the operations of their own forces. From this point of view it seems realistic to deprive the enemy of the capability to use the indicated part of the aerospace nearest to the earth.

The special interest expressed in the USA in questions of military uses of the aerospace is explained, to a significant degree, by the weakness of the U.S. position in the conventional spheres of armed forces operations. By casting their eyes into space, the realistic U.S. military theorists proceed from the position that the USA has been unable to achieve supremacy on land, on the sea and in the air. Therefore, space is considered to be the only expanse in which the USA can still count on obtaining definite military advantages.

[redacted] 1.3(a)(4)

Proceeding from the position that the goal of strategy in peacetime is basically limited to making a selection of the best types of weapons, which cannot be acquired in a finished form and which have to be created gradually on a selective basis, the military theorists and scientists of the USA are already studying questions of the possibility of creating various new weapons to conduct war in space.

In order to achieve supremacy in space, a whole series of space weapons systems is necessary, permitting the conduct of offensive and defensive operations. As the origin of the military use of space was established by the ballistic missile, which brought about the need to create a series of supporting systems of satellites, so for supremacy in space a bombing system is first required, to consist of a great number of nuclear bombs circling the earth in various orbits.

The idea of creating such a system had already been advanced in the USA in 1948. However, at that time the necessary technical means to realize it did not exist. At the present time these means do exist. They are the "Atlas" missiles with which the U.S. Air Force is armed and to which "Titan" missiles soon will be added, and, later (in 1964), powerful "Saturn"-type carrier missiles.

A second important question, which naturally arises in an attempt to create such a system, is the question of accuracy. Until the recent past, the expected low accuracy of such a system, together with the high cost of putting satellites into orbit, was considered to be the basic obstacle to the creation of effective carrier-satellites (sputnik-nositel) of nuclear missile weapons, but at the present time the problem of accuracy is already being resolved successfully. The most important phase in this line is the "Discoverer" program.

One of the goals in the "Discoverer" program is working out a system for the return from orbit of containers with various payloads. As of 1 December 1961, 10 containers had been recovered. These results are considered to be quite

[redacted] 1.3(a)(4)

[redacted]

[redacted]

1.3(a)(4)

IRONBARK

[redacted] 1.3(a)(4)

hopeful, and in the future the destruction of even comparatively small targets from space is considered possible.

At the present time certain requirements for a space bombing system have been formulated. The carrier satellites of this system must circle the earth in various orbits and must be supplemented by numerous decoy satellites (sputnik-lovushka). The creation of such decoys or dummy targets for misleading the enemy does not present any great difficulty. In order to hamper the radar or optical observation from the earth of each satellite of the system, it is intended to use antiradar covering and to paint them black.

Increasing the accuracy of nuclear strikes from space is planned by means of equipping the satellites, or the missiles launched from them, with homing guidance systems in addition to the programmed system, which must constantly be corrected from the earth. An infrared homing system is proposed as such a system.

The satellites of the space bombing system must, in advance, be put into orbits that pass over the territory of the Soviet Union. In the opinion of the U.S. military theorists, such actions cannot be considered to be an aggressive act so long as there is no international agreement defining the boundaries of the sovereignty of states beyond the limits of the atmosphere, and so long as there is no legal status for space bodies.

The creation of such a system, consisting of hundreds and thousands of satellites, ready to attack previously selected targets at any moment, and whose destruction presents great difficulties, is a kind of apotheosis of the strategy of intimidation.

On the other hand, authors of the plans for creating space bombing systems examine them from the standpoint of the possibility of transferring combat operations into space without conducting them on the earth, on the sea, or in the air. Thus, we are speaking of a new version of the theory of limited wars. It is contemplated that the results of military

[redacted] 1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

IRONBARK

[redacted] 1.3(a)(4)

operations in space will have a great military-political and economic significance for the countries participating in them and will be able to force the Soviet Union to make concessions.

The political significance of success in such a war will be determined by the fact that the country that achieves it will demonstrate its superiority in materiel-technical means, in its technological base, and in its theory, which will simplify the "conquest of the minds" of men, the recruiting of allies and the resolving of arguments with the enemy to one's advantage in various international organizations.

The fact that the system exists will supposedly force the enemy to take defensive measures which will entail huge expenditures. It will be necessary to detect, recognize, and destroy or render harmless, all such satellites one by one, including the decoy satellites.

Combat with carrier-satellites presents a very complex problem. It is considered that the direct destruction of satellites is unacceptable because it can lead to radioactive contamination of the expanse between the atmosphere and the lower Van Allen belt. Moreover, the remains of the satellite and antisatellite satellite will create a great number of dummy targets. Therefore, the enemy will be forced to install braking rockets on the satellites in order to have these satellites lose altitude and burn in the upper layers of the atmosphere. In order to hinder this work, booby-traps or other automatically operating defensive devices can be installed on the satellites in advance.

Further, it is contemplated that the enemy, i.e., the Soviet Union, will not limit itself to defense, and will orbit its own carrier-satellites. In turn, the USA will conduct a system of measures to combat them. As a result, the Soviet Union will be drawn into combat operations that will be conducted with a great strain on its forces, and may prove to be beyond the strength of its economy.

[redacted] 1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

IRONBARK

[redacted] 1.3(a)(4)

The development of space bombing systems is already being conducted by the USA at the present time under the NABS (Nuclear Armed Bombardment System) program. This program includes a series of special projects. One of them envisages the development of carrier-satellites of "space-to-surface class missiles (project PCBS), orbiting at an altitude of about 200 km. The other projects (SLOB and SHAOB) envisage the creation of strategic satellite bombers in "low" (altitudes up to 36,000 km) and "high" (altitudes over 36,000 km) orbits.

The practical creation of a space bombing system is considered feasible in the near future.

An important role in attaining supremacy in space is allocated to guided, manned spaceships. This was especially stressed by the former Chief of Staff of the U.S. Air Force, General Thomas White, who in 1960 stated: "In order to dominate aerospace it is necessary to have not only spaceships that can fly from one point of the globe to another, but it is also necessary to have men operate effectively in space."

The first steps in developing manned spaceships are the work on the experimental X-15 aircraft and the manned satellite of the "Mercury" project. In the near future flights of the X-15 aircraft are planned with the goal of attaining altitudes of 100 to 160 km, and in the beginning of 1962 the first flight of the American astronaut, Glenn, is expected, who is to orbit the earth three times.

Subsequent phases in this direction should be orbital gliding bombers and reconnaissance aircraft being developed in the "Dyna-Soar" project, and also, in the initial stage, by several leading American companies ("Lockheed", "Hughes" and others). The creation of manned space stations and command posts is planned for the future.

The moon is considered to be an important element of the U.S. "deterrent force" in aerospace. Its role from this point of view had already been stressed in January 1958

[redacted] 1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

IRONBARK

[redacted]

1.3(a)(4)

by Brigadier-General Homer Boushey (U.S. Air Force). He said: "The moon possesses one advantage that has long been recognized by military science, namely, the advantage of altitude."

The possession of military bases on the moon will supposedly preclude the possibility of destroying the U.S. military might in case of surprise attack. The duration of a missile flight from the earth to the moon is about two calendar days. Therefore the simultaneous neutralization of a moon base and of targets on earth is impossible. During a strike against targets on the earth a potential for delivering a counterstrike from lunar bases is retained. On the other hand, a strike against lunar bases discloses the intentions of the enemy and provides time for preparing and effecting countermeasures..

The military significance of the moon is determined by the potentialities that unfold with the employment of lunar bases. Such bases can insure: --observation of enemy territory with the aid of telescopes; --detection of enemy ballistic missile launchings; --radio countermeasures against systems for controlling space weapons and space communication systems; --launching of missiles against ground targets from launching pads concealed on the hidden side of the moon.

Already, interest in the moon is not limited to a study of questions and a discussion of discovered potentialities. Specific projects are being worked out which propose the construction of various structures under the surface of the moon from the freight compartments of missiles, and also the employment of various versions of pneumatic structures. The U.S. Army Corps of Engineers, and also various American companies ("Martin", "Aerospace", etc.), are conducting a great deal of work in this direction.

Parallel with working out the question of the military use of space for offensive purposes, considerable attention in the USA is being given to defensive space systems intended for antimissile and antisatellite, or, more exactly,

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

antispace, defense.

The U.S. Department of Defense is already working on designs for a combat space system, SCWS-694E, which includes several thousand destroyer satellites (sputnik-istrebitel) to destroy intercontinental ballistic missiles, and also for the "Saint" system, which includes several thousand interceptor satellites for intercepting enemy space objectives.

The creation of such antimissile and antispace defense means is already considered to be possible in 1966 or 1967. However, the generally accepted viewpoint in the USA is that in the near future space weapons systems will strengthen offensive, and not defensive, capabilities. Therefore, various versions of defensive space systems are considered to be less significant than plans for offensive systems.

A great deal of attention is also given to means of space reconnaissance. Such reconnaissance is completely feasible technically, not only for strategic but also for tactical purposes; it will greatly increase the capabilities of the ground, naval and air forces.

In accordance with the basic doctrine of the U.S. Air Force, aerospace forces must constantly be used to procure intelligence. It is recognized that in order to get intelligence information "a nation must be prepared to accept great risks when the risks of not having the information are considered greater."*

In the USA the various stages in the military mastery of aerospace are considered to be the following: --the first stage (1962 to 1965) - creation of military support satellite systems; --the second stage (1965 to 1970) - creation of carrier-satellites and means of antispace defense, flight to the moon and return to the earth, the creation of powerful carrier-missiles and manned space ships;

*United States Air Force Aerospace Doctrine, p. 9 /p. 5 of AFM 1-2/.

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

IRONBARK

[redacted] 1.3(a)(4)

--the third stage (after 1970) - the creation of autonomous space systems, manned space stations and command posts, and military bases on the moon. . .

In the first stage, space weapons still have an auxiliary significance and are intended for supporting the combat operations of all the types of armed forces of the USA. Control of them is effected from the earth. By the end of this stage systems of artificial earth satellites must be created for reconnaissance of ground targets, for detecting the launchings of ballistic missiles, for the precise connection of geodetic networks and geodetic tie-in of targets, for exact navigation of missile-carrying submarines and strategic bombers carrying "air-to-surface" class missiles, for global radio communications, for forecasting the weather, and also for radio-electronic intelligence and radio countermeasures. In this way a total of 7 satellite systems must be created, which, in the opinion of the American command, can be employed for the support of 13 basic operations of an offensive and defensive nature, conducted by all the types of U.S. armed forces.

The types of combat operations and the support systems of satellites that are planned to be used in them are represented in table 1.

The capabilities of employing a system of satellites can be examined with strategic air operations as an example. Reconnaissance satellites are to disclose the targets for such operations. Ultra-long-range missile detection satellites, in essence, determine the necessary degree of combat readiness of aviation for participation in the first operation of a future war, and in the future, together with other means, they will provide the warning to get aircraft airborne in a timely manner in order to prevent their destruction by missiles on the airfields where they are based. On the other hand, they will determine, at least approximately, the area of a missile launching, and, together with other reconnaissance means, will aid in locating the sites of missile bases so that they can subsequently be destroyed by aircraft and missile strikes. Geodetic

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

satellites will permit the defining of target coordinates for delivering strikes against them from the air; navigational satellites will permit the delivery of more accurate strikes against these targets with delivery aircraft carrying "Sky Bolt" and "Hound Dog" type missiles. Communication satellites will support communications, meteorological satellites will insure the receipt of the necessary meteorological data for planning operations, and radio-electronic intelligence satellites will provide data on the radiotechnical means of the enemy that must be neutralized or destroyed either in advance of, or during the operation itself.

From the table it is apparent that reconnaissance, ultra-long-range missile detection, communications and meteorological systems will find application in all the indicated operations, which explains the special attention now being devoted to space reconnaissance and communications systems. The remaining systems will also receive quite widescale employment.

1.3(a)(4)

The photographic equipment of the "Samos" reconnaissance satellites, including a container of film that can be returned to earth, should, according to the calculations of the Americans, insure the detection of ground objectives having linear dimensions of 6 to 18 meters, which is fully adequate for detecting such objectives and targets as missile bases, airfields, naval large units, concentrations of ground troops, industrial enterprises and others. From this standpoint, reconnaissance satellites are considered to be a reliable replacement for the special reconnaissance aircraft of the U-2 and U-3 type.

The operational "Samos" system must contain several (according to certain information, up to 20) satellites rotating in comparatively low orbits at an altitude of about 480 km.

The "Midas" satellites must provide for the detection of missile launchings in 1 to 2 minutes and warning 25 to 30 minutes before intercontinental ballistic missiles reach their targets (compared with the 15 to 17 minutes that are provided by the existing BMEWS ground radar system).

The operational "Midas" system will consist of 12 (from other data, 20) satellites constantly rotating around the earth in polar orbits at altitudes of up to 2500 km and higher. Besides detecting launchings, combat versions of the satellites will apparently be able to track, at least approximately, a certain section of the flight trajectory of missiles for target designation for ground antimissile defense (PRO) weapons. The immediate transmission of data acquired in this manner must be carried out through a network of communications earth satellites. The "Midas" program is being fulfilled according to proposed plans.

The program of creating systems of "Transit" navigational satellites and "Tiros" meteorological satellites is being successfully realized; the program of creating a global network of "Advent" communications satellites is being accomplished with a certain delay from the proposed

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

plans, and preparation for launching the first "ANNA" and "SECOR" geodetic satellites in 1962 is being carried out.

It should be noted that the above-listed support satellite systems are to provide information which cannot be obtained by other methods, or if it can be obtained, with insufficient accuracy. For example, geodetic satellites should insure the tie-in of geodetic grids and determine the location of the most important targets with a permissible error of up to 30 m, while the existing methods permit tying-in of the geodetic grids of continents and islands with errors measured in hundreds of meters and even in kilometers.

According to available evaluation data, a system of from 4 to 6 navigational satellites will permit a determination of the geodetic coordinates of submarines and aircraft with an accuracy of about 160-200m, i.e., many times more accurate than all other known navigational systems. For comparison, it can be pointed out that the experimental American "Omega" radio-navigational system provides for determination of the line of position at a range of 9000km with an accuracy of about 1.6 km. The more precise radio-navigation systems being developed have a limited operating range, which reduces the possibility of their operational employment. Concerning inertial navigational systems, so far, under the conditions of prolonged submarine cruises they cannot provide accuracy comparable to that which will be given by the satellite systems.

In future military operations, meteorological satellites will be able to insure rapid receipt of information about the meteorological situation of huge expanses. They should become an effective means for receiving meteorological data for all types of armed forces under conditions where the receipt of such data from other channels is impossible or, in any case, made very difficult.

Besides the extensive work in creating support satellite systems, the "SPADATS" ground system, which permits the detection and tracking of all objects that are in orbit, has already been created in the U.S. and carries out observation of the aerospace.

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

IRONBARK

[redacted] 1.3(a)(4)

In this way, American plans to create military support satellite systems are, fundamentally, being realized successfully.

In the second phase, the arsenal of space weapons will expand considerably and will be reinforced by new weapons. In addition to the operational support satellite systems, it is planned, in this stage, to create space weapons for antimissile and antispace defense, which can be employed as a sort of shield preventing access to space and the carrying out by the enemy of his military space programs. During this same period it is possible that satellites to carry nuclear/missile weapons and space bombing systems will be created.

In this phase great significance is attached to powerful carrier-missiles which, according to American calculations, will be able to put the US in first place as far as weight of useful payload that can be put into space is concerned. For this purpose, three versions of the "Saturn" type missile and the "Nova" missile are being developed.

These missiles are to perform the task set by President Kennedy--to carry out the flight of a manned spaceship to the moon and return it to earth by 1970. They can also be employed to put heavy military spaceships with a man into orbit around the earth and to create military command posts in space. In this way the dependence of space weapons on ground systems will be decreased sharply, and the prerequisites for their autonomous employment will be created.

Therefore, in the opinion of the Americans, the second phase should create the necessary technical prerequisites for US achievement of supremacy in space.

In the third phase, the widescale employment of space weapons is considered possible, both for supporting combat operations on earth during possible local

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted]

1.3(a)(4)

IRONBARK

[redacted]

1.3(a)(4)

conflicts and in general war, and for conducting "limited" war in space.

During this period, military space systems will already possess sufficient autonomy, not only for conducting war in space, but also for delivering strikes independently against ground objectives and targets when destroying or putting out of commission ground means of control and communications. The creation of military bases on the moon during this stage will significantly increase the "deterrent power" of space weapons.

In order to control combat operations, the creation of space command posts and bases in space is envisaged during this period. The need to create invulnerable command posts was stressed by President Kennedy in his message to Congress on the budget for the 1961/62 fiscal year. In this message Kennedy stated: "Command posts and communications centers that are invulnerable and are permanently located in space are only the beginning of an important and absolutely necessary effort directed toward the creation of a genuinely unified, invulnerable national system of command communications at a high level."

The U.S. Air Force, taking these conditions into consideration, undertook a study of the possibilities of creating space stations that could be used as command posts for controlling the combat operations of all types of armed forces, especially of space weapons, and also for carrying out reconnaissance and supporting the operations of their space forces.

Already, the American command does not limit itself only to the development of various types of space weapons and to resolving the technical problems connected with this. As is known, the formation of the first large units and units of ballistic missiles of strategic designation had already been started in the USA in 1957, two years before "Atlas" intercontinental

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

IRONBARK

[redacted]

1.3(a)(4)

ballistic missiles were introduced into armament. Now the first aerospace large units and units are being formed in a similar manner. Their mission includes the combat employment of the space weapons being created.

In 1960 the special 6594th Test Wing was already created in the U.S. Air Force. This Wing is located at the Vandenberg Air Force Base and consists of the following basic subunits: a satellite launching support squadron; a squadron to insure the security of satellite launchings; a group for collecting reconnaissance data from satellites (the composition of this group includes a squadron to search for equipment capsules and photographic containers ejected from orbiting "Samos" and "Discoverer" satellites, and also of manned Project "Mercury" satellites.) The T/O of the 6594th Wing consists of approximately 3000 men. At the present time the Wing has about 2000 persons.

The formation of the 9th Antispace Defense Division was begun in August 1961. The composition of the division includes a squadron for control and observation of space, which directs the work of the "SPADATS" system and collects data on the situation in space for reports to the military command. So far the staff of the division, composed of 28 men, has been organized. In the future, the 9th Division is to serve as the basis for organizing other units and subunits of antimissile and antispace defense.

The first aerospace division has also been formed in the composition of the U.S. Strategic Air Command. It is based at the Vandenberg Air Force Base and at the present time provides training of the personnel for the missile units that are being formed. Apparently in the future this division will carry out the training of personnel for space weapon units.

In conclusion it must be stressed that plans for converting space into the arena of future battles are

1.3(a)(4)

[redacted]

[redacted]

1.3(a)(4)

of a nature that is far from theoretical. The US government and the command of the U.S. Armed Forces are executing a broadly conceived program of military mastery of space, by which the scale and tempo of work in this direction will increase from year to year.

While advancing proposals on banning the use of space for military purposes, the government of the USA has at the same time developed a 15-year program calculated to achieve supremacy in space which requires expenditures of tens of billions of dollars.

It is impossible to discount the successes in this direction that have already been achieved in the USA up to the present time. By 1 December 1961 the Americans had undertaken 109 attempts and orbited 64 various space devices, including 39 artificial satellites that have a clearly military purpose. In addition, by that time there were already 24 American military-purpose satellites orbiting the earth, including "Samos" and "Midas" experimental reconnaissance satellites.

Preparatory work for achieving supremacy in space includes such measures as working out basic doctrines, organizing widescale military research work, creating a special command to develop new armament systems, with a T/O of about 60,000 men, and organizing large units and units of aerospace and purely space weapons.

All this requires further serious study of the opinions, plans and technical achievements of the USA in the field of mastering the aerospace, in order to retain and strengthen the leading position of our country in the exploration and mastery of space.

COUNTRY : USSR

SUBJECT : MILITARY THOUGHT (TOP SECRET): "American Military Technical Means of Combat in Space" by Major General of the Engineer-Technical Service P. Vysotskiy

DATE OF INFO : December 1961

APPRAISAL OF CONTENT : Documentary

SOURCE : A reliable source (B).

Following is a verbatim translation of an article titled "American Military Technical Means of Combat in Space", by Major General of the Engineer-Technical Service P. Vysotskiy.

This article appeared in the 1962 First Issue of a special version of the Soviet military journal Voyennaya Mysl (Military Thought). This journal is published irregularly and is classified TOP SECRET by the Soviets. The 1962 First Issue went to press on 29 December 1961.

Headquarters Comment: Military Thought is published by the USSR Ministry of Defense in three versions, classified RESTRICTED, SECRET, and TOP SECRET. The RESTRICTED version has been issued monthly since 1937, while the other two versions are issued irregularly. The TOP SECRET version was initiated in early 1960. By the end of 1961, 61 issues of the SECRET version had been published, 6 of them during 1961.

American Military Technical Means of Combat in Space 1.3(a)(4)

Major General of the Engineer-Technical Service

P. Vysotskiy

The first scientific-research work on the creation of military space devices for the conduct of special types of reconnaissance (photo reconnaissance and radiotechnical reconnaissance), as well as for the delivery of nuclear strikes from space against strategic ground targets using satellite missiles (snaryad-sputnik), were begun in the USA in 1946, while the creation of reconnaissance apparatus (television, facsimile television, photo locator, and radar) for earth satellites was begun in 1950.

Direction and coordination of this work was assigned to the U.S. Navy Department, with the participation of forces and means from the Department of the Air Force. About 50 large firms were called on to cooperate in the work at that time. In order to create military space devices and systems, the Americans needed data on conditions in space and their possible effect on satellites sent into space. In July 1955, the U.S. Government announced preparations for launching artificial earth satellites with a variety of scientific research apparatus during the 1957-1958 Geophysical Year. Preparations for the launchings were carried out in a unified program by the Defense Department, the Academy of Sciences and the U.S. National Committee for the International Geophysical Year. This project was designated "Vanguard". Responsibility for development of the carrier missiles, preparation of launching sites and launching of the satellites was placed upon the Department of Defense.

Fulfillment of the "Vanguard" program commenced in December 1957. However, the first attempt to launch a satellite into orbit proved unsuccessful. The "Vanguard-1" satellite was not successfully launched into space until 17 March 1958.

[redacted] 1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted]

IRONBARK

1.3(a)(4)

[redacted] 1.3(a)(4)

This program was concluded in September 1959 and proved the most unsuccessful of the American space programs. As a result of 11 launch attempts, only three satellites were put into orbit, and they permitted the collection of only the most general data on the physical parameters of the outer layers of the atmosphere and of the space nearest the earth.

Failures in carrying out the "Vanguard" program forced the Americans hastily to work out the new "Explorer" research program on the basis of carrier-missiles, using "Jupiter" and "Thor" medium-range ballistic missiles as the first stages. (More recently, the specially created "Scout" research carrier-missile has been used for this purpose.)

The "Explorer-1" satellite, launched 31 January 1958, three months after the first Soviet satellite, became the first American satellite put into orbit around the earth. But this program also has not yet been completed.

In August 1958, the Americans proceeded to carry out the "Pioneer" space research program on the basis of carrier-missiles using "Jupiter", "Thor" and "Atlas" ballistic missiles as first stages, in order to study the physical parameters of space within the limits of the earth's orbit, as well as in the area of the moon and sun. But in this program also, not everything worked out successfully. Of the 9 attempted launchings, only two were crowned with success. The "Pioneer-4" and "Pioneer 5" space devices were, in the first case, put in orbit around the moon and, in the second case, in orbit about the sun.

Development of the first military earth satellites, and particularly the reconnaissance satellites of the "Pied Piper" project, continued simultaneously with preparations for the realization of scientific-research programs. In 1958, as a result of the lag behind the USSR and the numerous failures in satellite launchings, all space programs were reviewed in the USA and the decision was taken to expedite the creation of military space systems.

[redacted] 1.3(a)(4)

[redacted]

1.3(a)(4)

IRONBARK

1.3(a)(4)

[redacted] 1.3(a)(4)

On the basis of the "Pied Piper" project, three main projects for the creation of military reconnaissance satellites had taken shape by 1959: the experimental project "Discoverer" and the long-term experimental projects, "Samos" and "Midas", development and test launchings of which are being carried out at the present time. It was at this same time that intensive planning and development of other long-term military technical means of waging armed combat in space was begun.

At the present time, work in the creation of space weapons and space research means is being conducted on the basis of the program adopted in 1960 and designed for the period 1960 to 1975. A centralized governmental system of direction has been created for the fulfillment of the program. Responsibility for the development of military satellites has been placed upon the Department of Defense, and for the practical work, on the Air Force Weapons Systems Development Command. The National Aeronautics and Space Agency is responsible for work at the national level and for the fulfillment of a number of military programs.

The 15-year plan proposes the placing of about 970 space devices into space, of which about 570 will be of purely military designation.

At present, carrier-missiles and military space craft are being developed to accomplish the following basic tasks:

- the placing of light, medium and heavy research payloads and military space craft of various designation into space in various orbits;

- the support of various combat operations of all types of armed forces for the purpose of raising their effectiveness (military earth satellites);

- the conduct of armed combat in space and the destruction of targets on earth from space (carrier-satellites and space bombers with nuclear/missile weapons);

- the implementation of antimissile and antispace defense of the North American continent (satellites and maneuverable space craft).

IRONBARK

[redacted] 1.3(a)(4)

Let us examine briefly the projected military technical means intended for the conduct of armed combat in space.

Carrier Missiles. During the forthcoming 15-year period of exploration and mastery of space, it is planned that extensive use will be made of carrier-missiles which have already been developed and are currently in use, employing, as first stages, modernized "Thor" and "Atlas" ballistic missiles, with specialized second and third stages.

Such missiles include: - "Thor-Able", "Thor-Delta" and "Thor-Agena B". They are intended for placing 500 to 700 kg payloads into space. The weight of these carrier-missiles is about 50 to 55 tons, with a first-stage power-plant thrust of about 68 tons. The utilization of 210 such missiles is planned by 1975.

"Atlas-Able" and "Atlas-Agena B", intended for placing payloads of up to 1.6 tons into space in higher orbits. The weight of the carrier-missile is about 110 tons, with a first-stage power-plant thrust of about 170 tons. It is intended that about 590 such missiles will be used over the 15 years.

During the period 1963 to 1968, the Americans plan to conclude development and commence practical use of three new types of carrier-missiles, the "Atlas-Centaur", "Saturn" and "Nova".

The "Atlas-Centaur" carrier-missile will have as its first stage a significantly modernized and improved variation of the "Atlas" missile, and as its second stage, the "Centaur" missile, operating on liquid fuel (oxygen and hydrogen). The launching weight of this carrier-missile will exceed 110 tons, with a first stage thrust of about 176 tons. The thrust of the second-stage engines will be 14 tons. This missile will be able to put a payload of four tons in a 500-km high orbit, and deliver a payload of about one ton to the moon. The missile is now in the concluding stage of development and testing of its second-stage power plants. Practical utilization of the

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted]

IRONBARK

1.3(a)(4)

[redacted]

1.3(a)(4)

missile is planned for 1963, and it is intended that about 65 military and scientific-research space devices will be put into space by 1975, using this missile.

The "Saturn" carrier-missile is being developed in three versions, which are intended to place payloads of from 10 to 50 tons into space with a launching weight of 525 to 650 tons. The distinctive feature of this missile is that it is to be composed of five standard, unified stages, designated S-I, S-II, S-III, S-IV and S-V, which can be put together for C-1, C-2 and C-3 missiles in several variations to expand the ranges of payloads put into space.

The "Saturn C-1" carrier-missile has been under development since 1958, under the initiative of the Department of Defense and can have two- or three-stage versions.

According to project data, the first stage S-1 consists of 8 H-1 liquid-fuel rocket engines with 85 tons of thrust each. Its total thrust is 680 tons, length 24.5 meters and diameter 6.5 meters.

The second stage, S-IV, is a cluster (svyazka) of six L-10 liquid-fuel rocket engines with 6.8 tons of thrust each, operating on liquid fuel(oxygen and hydrogen). Thrust of the second stage is about 41 tons, length 15.2 meters, and diameter 5.5 meters. The third stage is a cluster of two RL-10 engines, with a total thrust of 13.6 tons, 16.2 meters in length and 3 meters in diameter.

The first launching of the "Saturn C-1" missile was carried out in October 1961, with a functioning first stage and dummy second and third stages. It is planned that 10 "Saturn C-1" missiles will be launched before 1964 as experiments. The Americans are expediting its development in every way. It is possible that the missile will be ready for practical use in 1964.

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted] 1.3(a)(4)

IRONBARK

[redacted] 1.3(a)(4)

According to calculations of the American specialists, the three-stage version of the "Saturn C-1" should assure the orbiting of space hardware of the following weights: 10-ton earth satellites in a 500-km high orbit, a 5.4-ton space craft in orbit around the moon, a 4.1-ton space craft in orbit around the sun and 6.8-ton "Dyna-Soar" aerospace craft (raketoplan) in orbit about the earth.

The "Saturn C-2" carrier-missiles (two- or three-staged) and the "Saturn C-3" (four- or five-stage) are considered more powerful than the "Saturn C-1" and will put loads of up to 50 tons into space. The completion of their development is planned for 1966 or 1967. The "Saturn" missiles are considered to be the basic American heavy missile, and the tentative requirement for them for fulfillment of military and research programs is 70 to 80 missiles.

The "Nova" carrier-missile is a five-stage system. It is to have a launching weight of 2100 tons, a first-stage power-plant thrust of 2700 to 4000 tons, is to put a payload of 70 tons into a low orbit around the earth and 20 tons into 24-hour orbit, deliver a 12-ton space craft with three astronauts to the moon, and ensure the return of a 3-ton capsule back to earth. It is proposed that a cluster of four or six F-1 type engines, operating on high-caloric fuel and liquid oxygen, will be used as the first stage in this missile. It is proposed that a cluster of F-1 engines will be used as the second stage as well. Subsequent stages (possibly three more) will use engines operating on liquid oxygen and hydrogen. Test launchings of the missile are planned for 1966, and practical utilization beginning in 1968. It is planned that 20 such missiles will be produced for the 15-year program.

There also exist more long-term projects for the creation of carrier-missiles during the period 1970-1980. They include "Arcturus", "Antares" and "Aldebaran", which, according to American plans, should ensure an even more extensive mastery of space. Only a few estimated data are known about these carrier-missiles.

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted]

1.3(a)(4)

IRONBARK

[redacted]

1.3(a)(4)

"Arcturus" is designed to have a launching weight of 1,000 to 1,600 tons, with a first-stage maximum thrust of 1,360 to 2,000 tons.

"Antares" will have a launching weight of 4,500 to 9,000 tons and should be able to place a load of 1,100 to 2,000 tons in orbit around the earth and deliver a load of 900 to 1,800 tons to the moon.

"Aldebaran" is a single-stage cruise missile weighing 50,000 tons, equipped with an improved-type nuclear power plant, and is designed to place a load of 9,000 tons in orbit around the earth and deliver a load of 3,000 tons to the moon.

The designs for these carrier-missiles are, for the time being, based on very approximate calculations; test flights are projected for 1973 to 1980.

The present lack of powerful carrier-missiles, capable of putting large payloads into space, makes the Americans quite feverish and impedes their general progress in the mastery of space and the development of carrier-missiles. It is no coincidence, therefore, that governmental scientific centers and a number of the larger aircraft and missile construction firms are proposing the most varied designs, which, to a significant degree, encumbers the development of space means of combat.

In this connection, preliminary research under U.S. Air Force direction has been conducted and is continuing on the feasibility of creating a single, long-term complex of carrier-missiles for the universal accomplishment of the tasks in mastering space. This entire complex of work has been given the general designation: Project "Phoenix". By now, the optimum dimensions and configuration of the carrier-missiles have already been determined; methods of assembly, transport and launching have been refined; and problems in the creation of re-usable missile stages have also been studied under this project.

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted]

IRONBARK

1.3(a)(4)

[redacted] 1.3(a)(4)

Out of all the carrier-missile designs, 10 types have been selected, mainly using liquid-fuel rocket engines (zhidkostno-reaktivnyy dvigatel - ZhRD) which operate on liquid oxygen and hydrogen, and a turbo-pump system of fuel feed.

Under the "Phoenix" project it is proposed to create five basic modifications of two-or three-stage carrier-missiles, with a first-stage thrust of 220 to 1,330 tons, capable of putting 6.8 to 42-ton payloads into orbit around the earth.

While the cost of putting one kilogram of payload into orbit costs $10,000 to $100,000 using the early types of carrier-missiles, the average cost is $2,200 for the missiles which are used at present. Missiles created under Project "Phoenix" should lower the cost of delivery into orbit to $220 per kilogram of payload.

The high cost of delivery is caused by the one-time use of the first and second stages of the carrier-missile. Therefore, great attention is currently being devoted to the development of re-usable first booster stages. Thus the feasibility is being examined of creating boosters with a parachute recovery system possessing wings and control surfaces, which can be recovered by means of gliding in the atmosphere before landing, with turbo-jet engines assuring vertical landing, as well as boosters using turbo-jet engines as the primary engines. It will be possible to create such boosters by 1970.

Earth satellites of military designation for the support of combat operations. The development of a number of satellites of military designation has been in progress since 1957 and 1958. They are intended for the collection of intelligence information on objectives and targets on the territories of the countries of the probable enemy, intelligence on the activity of missile troops, for assuring precise radio-navigation, geodetic tying in of the nets of various continents and strategic targets to geodetic nets, as well as for providing uninterrupted and reliable radio communications for the control of troop operations and the receipt of timely and precise meteorological information.

[redacted] 1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted] 1.3(a)(4)

IRONBARK [redacted] 1.3(a)(4)

The basic military satellites, projected for practical utilization in 1962 to 1965, include the "Samos", "Midas", "Transit", "Advent" and "Rebound" satellites; the "Tiros", "Nimbus" and "Aeros" meteorological satellites; and the "Anna" and "Secor" geodetic satellites.

The "Samos" satellites are intended for reconnaissance of ground targets (Missile and airbases, major industrial enterprises, areas of troop concentration, fleets at sea, etc.) as well as of radio emissions from ground radiotechnical facilities. These satellites are put into polar orbit at an altitude of about 500 km by means of the "Atlas-Agena B" carrier-missiles. Photo-television apparatus, photo apparatus, as well as radio intelligence apparatus, can be installed within these satellites.

Photo-television apparatus serves for reconnaissance of ground targets. It consists of a photographic camera, automatic apparatus to develop the photographic film on board the satellite, and a television installation to transmit the image received on the photographic film to ground television receiver stations, where the images are reproduced on the television screen and photographed a second time to obtain a photographic intelligence document. It is considered possible to distinguish objects on earth with linear dimensions of 76 to 152 meters on the first photographs using this apparatus, which are transmitted from an orbit of about 500 km in altitude. It is possible to sketch only the most general picture of the enemy's territory on the basis of intelligence information received from such apparatus.

The Americans plan to utilize photo-television apparatus capable of revealing objects with linear dimensions of 2.5 to 3.5 meters for detailed reconnaissance of previously noted areas in the enemy's territory from the same altitudes.

The Americans give first preference to photographic apparatus, since, if it is of high quality, it can provide the photographing of large areas of the earth's surface during a brief period of time. However, in this instance it is

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

[redacted]

IRONBARK

1.3(a)(4)

[redacted]

1.3(a)(4)

necessary to return containers with photographic films from orbit to the earth in order to obtain the intelligence information. Therefore, the photographic apparatus is located in the body of the second stage of the carrier-missile, while the container for receiving the exposed photographic film is located in its nose cone and is equipped with a system for separation from the missile and a parachute recovery system. Development of the system for return and recovery of the containers is being carried out by the Americans in the "Discoverer" experimental reconnaissance satellites. Of 25 such satellites placed into orbit up to the present time, 11 containers with experimental reconnaissance apparatus and photographic film have been returned.

Photographic apparatus with a resolution capability "optical-film" on the order of 40 to 100 lines to the millimeter is being developed to equip the "Samos" satellites. The use of photographic apparatus with focal lengths of 30, 90 and 360 cm will permit the exposure on photographs of objects having linear dimensions of 0.7 to 18 meters when photographing from an orbit of about 240 km. To illustrate what this means, it can be noted that aerial photographs used during the Second World War which were taken from altitudes of about 9 kilometers could reveal objects with linear dimensions of 4.5 to 6 meters on the photographs. Therefore, the employment of high-quality aerial films, and cameras with large focal lengths, opens up great prospects for photographic reconnaissance from satellites. Thus, it is known that in 1960 "Lockheed" and a number of other firms were assigned the development of the "Samos E-6" photo-reconnaissance satellite, weighing about 1400 kilograms. It was planned to include up to 12 photographic cameras with various focal lengths and several types of photographic film of varying sensitivity in the satellite's complement of equipment. The containers with the apparatus and the exposed film are to be returned from orbit individually or in groups, using the recovery systems equipment. The SNAP-8 nuclear power source, generating 30 kw and destined to function for one year, is being developed to power the equipment on board the "Samos".

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted]

IRONBARK

1.3(a)(4)

[redacted] 1.3(a)(4)

In order to decipher the great volume of information received from the satellites, high-speed electronic computers are being developed which should rapidly reveal objectives and targets, compare them with similar images, identify the nature and purpose of the objectives, and produce printed and graphic information about them which is suitable for utilization by the armed forces. Five C-130 "Hercules" military transport aircraft are being re-equipped at the present time to pick up photographic containers being returned from "Samos" satellites.

Reconnaissance radar sets, which would be capable of making satisfactory identification of major military and industrial objectives from altitudes of about 400 km, are also being developed to be installed on board the "Samos" satellites.

During the period 1960 and 1961, the Americans attempted four times to launch "Samos" satellites, but were successful in placing only two in orbit (with an effective period of service of about one month). Design work on the "Samos" is being carried on extremely actively by the Americans. They hope to obtain data, by means of these satellites, primarily on the disposition of intercontinental missile-launching mounts and air bases of strategic aviation. However, because of the complexity of the problem, the Americans were unable to fulfill their projected plans for 13 launchings during 1960 and 1961. For 1962, 20 "Samos" satellite launchings are envisaged by the plan, and subsequently 6 to 8 satellites are to be put into orbit annually for periodic reconnaissance of targets in areas of the enemy's territory which are of interest, and particularly in the arctic areas of the Soviet Union.

The "Midas" satellites are intended for reconnaissance of nuclear/missile strikes against U.S. territory while they are being carried out, with 25 to 30 minutes early warning before the missiles reach their designated targets. Ballistic missiles should be detected by the "Midas" satellites, 1 to 2 minutes after launching, by the intensive thermal radiation of their power plants during the active sector of the missiles' flight trajectory. The "Midas" satellite system is, therefore, more

[redacted] 1.3(a)(4)

[redacted]

1.3(a)(4)

advanced than the system of radar stations for ultra long-range detection of missiles, which permits the detection of missiles only after they rise above the line of the horizon and enter the zone of the beam of the radar stations. The possibility of detecting ballistic missiles at an effective range of 16,000 to 24,000 km, when their strike may be directed at the U.S. by way of the Southern Hemisphere, where there are no ultra long-range missile detection radar posts, is considered to be another advantage of the "Midas" satellite system.

On board each "Midas" satellite there is an infra-red scanning mechanism, for detection of the fact that a missile has been launched (either individually or a mass salvo of missiles). The receiving element of this mechanism (in one of its experimental models) is sensitive to radiations in the wave band of 10-100 microns, and possesses selectivity which permits it to distinguish infrared radiations of intercontinental missile engines from emanations of other ground heat sources (blast furnaces, coke-conversion combines, forest fires, etc.).

On the basis of data from the scanning mechanism, the satellite's computing equipment must determine the missile's approximate direction of flight and the area against which the strike is delivered. These data and the alarm signal from the satellite go to a data-transmitting radio apparatus, then to special ground posts for observation of the satellites and the receipt of information. It is also considered possible subsequently to transmit the information from the satellites to ground receiving points through a network of special active communications satellites, which are being developed in the "Courier" and "Advent" projects.

A network of 20 "Midas" satellites, moving in orbits with an apogee of 2,500 km and a perigee of 320 km, will have to be created in order to provide uninterrupted observation of the enemy's territory.

The "Midas" satellites have been under intensive development by the Americans since 1958. "Midas" satellite launchings commenced in 1960. In all, 4 launchings were carried out and 3 satellites were placed in orbit. It is known, for example, that the "Midas 4" satellite detected the experimental launching

[redacted] 1.3(a)(4)

of an American "Titan" ballistic missile two minutes after launching and transmitted the detection signal to earth. According to the estimate of the Americans, in spite of the intensive work, fulfillment of the "Midas" project is lagging about 10 months behind the planned schedule. The launching of 10 satellites annually with an effective duration of more than a year is envisaged for the period 1962 to 1965, according to the "Midas" satellite-launching program, drafted for 15 years.

The "Transit" radio-navigational satellites are intended by the Americans for the precise navigation of vessels and aircraft, and primarily for the existing missile-carrying submarines armed with "Polaris" missiles, and strategic bombers carrying "air-to-surface" class "Hound Dog" and "Sky Bolt" missiles. It is known that at the present time there exist a multitude of autonomous and non-autonomous(operating jointly with ground apparatus) navigational systems. However, they provide precise navigation only in equipped areas and require constant correction of their readings.

In turn, non-autonomous navigational systems, even those providing high precision in fixing coordinates, are considered by the Americans to be vulnerable, for even if only one station is put out of commission by the enemy, the system is rendered practically useless. The utilization of such systems to fix the launching point for "Polaris", "Hound Dog" and "Sky Bolt" missiles is considered unreliable as well. According to American calculations, the "Transit" satellites should fix coordinates for vessels or aircraft with an accuracy of about 200 meters.

Moreover, the Americans consider a system of radio-navigational satellites to be invulnerable because the means to combat such satellites have not yet been created.

The operating principle of the system, which consists of 6 or 8 satellites, is the following. The satellite, with a complex set of radio-electronic apparatus on board (a high-stability radio transmitter, a recording mechanism, a transmitter of the parameters of the satellite's orbit, and source of power) is placed in a calculated circular orbit at an

1.3(a)(4)

[redacted]

[redacted]

1.3(a)(4)

altitude of 700 to 900 kilometers. The satellite's ground control station measures the precise parameters of its orbit once every 24 hours and transmits them to the satellite, where they are recorded on magnetic tape. Simultaneously, time adjustment signals are sent to the satellite. While moving in orbit, the satellite transmits to earth, at intervals of 1 to 2 minutes, a signal from its stable transmitter, data on the parameters of its orbit and signals of standard time. On the basis of all these data, the vessel or aircraft receiving-measuring and computing apparatus calculates the precise coordinates of the location of the vessel or aircraft. The precise coordinates of the location just before missile launchings of missile-carrying submarines (in submerged position and receiving the "Transit" satellite signals on a trailing antenna, fixed to a buoy), or a carrier bomber, are fed into the computer apparatus of their flight control system and serve as the initial data in firing against the selected targets.

"Transit" satellites have been under development by the Americans since 1957. These were the very first satellites intended for the creation of a radio-navigational net operating in actual practice. Of the seven satellites launched in 1960 and 1961, five were put in orbit. The last of them, "Transit 4A", is equipped with a "SNAP-3" nuclear reactor, which will provide electric power for the radio-technical apparatus on board for a period of one year. It is considered that it fully meets the necessary requirements in its tactical-technical characteristics.

It is planned that 12 such satellites will be put into space in 1962 and 1963. An operating network of them should include six satellites, of which four are to be put into circular orbits with an angle of inclination of the planes of their orbits to the equator of about 67°, while two are to be put into circular equatorial orbits at an altitude of 700 to 900 km. It is planned that 114 "Transit" satellites will be put into space in 15 years.

The "Rebound" and "Advent" communications satellites are intended for a global radio communications net, which will provide control of the combat operations of all types of armed

1.3(a)(4)

[redacted]

[redacted]

1.3(a)(4)

forces and primarily for the strategic attack weapons of the USA.

It is known that the Americans are striving to develop reliable radio communications means in order to bring, primarily, strategic aviation, intercontinental ballistic missiles and submarine missile carriers up to combat readiness, and to control their combat operations. For this purpose, in addition to the creation of a global communications net, the Americans are conducting work on the search for radio communications means for control under exceptional conditions, using high-altitude missiles of the "Tattle Tale" project, and are also studying the feasibility of creating passive communications satellites and passive reflecting belts, located in orbits around the earth, and active communications earth satellites.

The "Tattle Tale" project envisages the creation of a battery of high-altitude missiles, which are to be lofted to an altitude of 1,600 km, carrying transmitting and relaying apparatus, when the normal functioning of other means of control has been disrupted. It is to transmit to command posts of all types of armed forces instructions to bring them up to combat readiness, and combat orders for the commencement of combat operations.

The utilization of communications earth satellites is considered a long-term prospect. Two varieties of communications satellites are being developed for these purposes: the passive, which reflect signals sent to them from transmitting to receiving points, and active, containing receiving and transmitting radio communications apparatus on board, which provide for the relaying of communications sent to the satellite from the transmitting to the receiving points. Depending on the height of the orbit, such satellites can provide ultra-short-wave communications at distances of thousands of kilometers, which will make it possible to dispense with the use of numerous earth relay stations, which are complex to build and are expensive.

The first experimental passive satellite was the "Echo 1", launched into space in 1960 and currently in orbit. It provides periodic radio communications between the east and west coasts

[redacted] 1.3(a)(4)

[redacted]

1.3(a)(4)

of the USA, as well as between the USA and the countries of Europe. In appearance, this satellite is an inflated globe, 30 meters in diameter, manufactured from thin film, and covered with a thin layer of aluminum paint in order to increase its capacity to reflect radio waves.

A shortcoming of this type of satellite is, nevertheless, its low radio-wave reflecting capability, which necessitates the construction of great antenna systems at transmitting and receiving points, capable of automatically tracking the satellite during flight, in order to create reliable radio communications lines.

Work on the "Rebound" project is being carried out in this connection. The "Rebound" satellites will also take the form of inflated structures, but of lesser diameter, and in order to increase the reflection of radio waves, their outer surface will be filled out in the form of numerous conjugate corner reflectors (sopryazhennyy ugolkovyy otrazhatel). The launching of about 46 such satellites is planned for the period 1962 to 1965, but according to estimates of the Americans, even they will not accomplish the tasks of creating global radio communications nets.

For two years the Americans tried unsuccessfully to create an artificial reflection belt around the earth (in polar orbit) out of metallic reflecting dipoles. At first, the project for the creation of an artificial reflection belt bore the designation "Needle", but afterwards the designation "West Ford". This project envisages placing in orbit a satellite with a container holding reflecting dipoles, which, when distributed along the orbit, will create a reflection belt for radio waves and will be able to provide uninterrupted radio communications, particularly in arctic areas.

An attempt to create such a belt was undertaken with the launching in October 1961 of the "Midas 4" satellite, within which a container with dipoles was installed. Because of a series of malfunctions, the dipoles were not successfully dispersed along the satellite's orbit. It should be noted that

1.3(a)(4)

[redacted]

this attempt bore an experimental character, and the Americans themselves had little faith in the possibility of organizing reliable radio communications by this method. Most probably this was a diversionary maneuver in connection with the "Midas 4" launching.

The more promising satellites for these purposes are the active communications satellites. Three projects ("Courier", "Decree" and "Steer") were being developed for the U.S. Army, Air Force and Navy as experimental models of such satellites, but since 1960 they have been replaced by a single, overall long-term project called "Advent", the development of which will take place in three stages.

For the first stage it is proposed that satellites weighing about 450 kg will be created in order to carry out communications in the 1700- to 2400-megacycle frequency range on ten channels, with a transmitter of about 1 watt power and a transmitting antenna 50 cm in diameter.

For the second stage, it is planned that satellites weighing about 1,360 kg will be created to contain about 490 kg of communications apparatus. Communications will be carried out on the frequency band of 4400 to 5000 megacycles, with a transmitter output power of 5 watts. This apparatus is calculated for communications on six channels, with each channel having a band width of 100 megacycles. Each broad-band channel can be used for the transmittal of encoded information on 100 telephone channels, and on 1,000 telephone channels for non-coded.

For the third stage, satellites weighing up to 2,000 kg, destined for 24-hour orbits, will be created. The apparatus of these satellites will be calculated for operating on the 5,000- to 10,000-megacycle frequency band. These satellites will be equipped with inflatable parabolic antennas up to 6 meters in diameter. Miniaturized nuclear power sources are being created in order to extend the period of service of these satellites.

1.3(a)(4)

[redacted] 1.3(a)(4)

It is planned to place "Advent" satellites in orbits up to 36,000 km in altitude by means of "Atlas-Centaur" and "Saturn" missiles. Two experimental "Advent" satellite launchings were planned for 1961, but this schedule was not maintained. Two experimental satellite launchings a year are planned for the period 1962 to 1964, while the creation of a global net consisting of three satellites in a 24-hour equatorial orbit will take place in 1965, using a "Saturn" missile, which is supposed to be ready for practical use by that time.

The "Nimbus" and "Aeros" meteorological satellites are intended for the creation of meteorological nets for weather reconnaissance in various areas of the globe for the purpose of precise weather predictions in support of all types of armed forces.

The first meteorological satellites were "Tiros" satellites, equipped with two television cameras capable of transmitting cloud-cover images to ground reception stations for one year. On earth, meteorological maps were compiled on the basis of these data, making it possible to determine the distribution of wind velocities at various altitudes, and of storm centers and the direction of their movement along the earth's surface. A great quantity of meteorological data were received from the three "Tiros" satellites placed in orbit during 1960 and 1961, for the analysis and processing of which attempts were made to utilize electronic computers. "Nimbus" and "Aeros" satellites with television, infrared and radar apparatus on board are being created in order to create a constantly functioning net of meteorological satellites. It is planned to put "Nimbus" satellites in orbits of about 1,100 km in altitude and the "Aeros" satellites with improved television cameras in 24-hour orbits. In all, it is planned to launch about 60 satellites of this type during the 15-year period.

Data received from the satellites will be processed by the use of electronic machines and will be transmitted to interested headquarters.

[redacted] 1.3(a)(4)

[redacted]

1.3(a)(4)

The "Anna" and "Secor" geodetic satellites are intended for more precise determination of the earth's shape, for geodetic tying in of points situated on various continents and of geodetic nets, particularly the nets of the USSR and USA, by the spatial triangulation method, as well as for the tying in of strategic targets to these nets with an accuracy of 10-30 meters, for operations against them by nuclear/missile weapons of attack.

At the present time, two types of geodetic satellites are being developed in the USA: optical (Project "Anna") and radio range-finding satellites (Project "Secor").

The development of satellites in the "Anna" project began in 1958. It was proposed that by the end of 1960, satellites would be created weighing 50 to 68 kg, and 90 cm in diameter, equipped with sources for intensive light radiation, and which could be photographed against the background of stars, and on the basis of these photographs make a geodetic tie in of nets and targets, using astronomic calculations. The pulse light source is calculated for the formation at two-minute intervals of light flashes with a duration of 1 millisecond and with an intensity of 320 lumens per second. It was also proposed to install in the satellite a pulse-operating radio beacon with the same frequency and duration for automatic tracking of the satellite in the celestial sphere.

In connection with the fact that the development of this satellite was not completed in time, the program for the creation of geodetic satellites was reviewed at the end of 1960, and in view of its direct military significance, the responsibility for its fulfillment was placed on the Department of Defense.

The operating principle of the "Secor" radio range-finding system is based on the use of the method of sequential comparison of distances from four radio range-finding stations on earth to the radio satellite located in an orbit, the parameters of which are known. The component elements of the system will be: three ground air-transportable stations, equipped with special radio-ranging installations and located at points with known geodetic coordinates; a ground station which will be located at a point which can be tied in to a known geodetic net; and a satellite with the transmitting-receiving radio apparatus.

[redacted]

IRONBARK

1.3(a)(4)

[redacted] 1.3(a)(4)

The "Secor" system is to provide a range of operation (measurement of distance between points) of up to 16,000 km and operate on a frequency band of 482 to 512 megacycles. Ground transmitters are calculated for an emission power of 500 watts at a frequency of 512 megacycles. The ground receiving stations will operate on frequencies of 482 megacycles.

Experiments with the "Secor" equipment are being carried on simultaneously with launchings of "Transit" radio-navigational satellites, on which the appropriate testing apparatus has been installed.

The Americans propose to create portable units of ground apparatus which can be transported, as well as a unit of miniaturized apparatus for the fourth of the stations, which is intended for secret installation in the area of the target and which must be tied in to the other three stations. Such an apparatus can be thrown from a plane in the areas of the targets which are to be tied in.

The expected accuracy of distance measurement by such a system is about 0.5 meters.

* *

*

A number of major American firms and the Weapons Systems Development Command are conducting planning work on a broad front for the creation of offensive space bombing systems designed to destroy ground targets from space. It is considered possible to create such systems only after 1970.

It is proposed that automatic carrier-satellites and piloted space-carrier-bombers will be included in this system.

[redacted] 1.3(a)(4)

[redacted]

1.3(a)(4)

Carrier-satellites for nuclear/missile weapons are being studied and designed under the general program, NABS. At present three projects under this program are known.

The first project, PCB, envisages the creation of carrier-satellites for "space-to-surface" type missiles for the destruction of ground targets.

It is proposed that three-ton carrier-satellites will be placed in an orbit 185 km high, with an orbital period of 90 minutes. At this flight altitude, the carrier-satellite will be within the limits of direct visibility from ground control stations for 18 minutes, from where commands can be issued for launching "space-to-surface" missiles. Depending on the size of the angle of direction of the launch in relation to the tangent to the orbit, it is considered possible to destroy targets at distances of from 9,000 to 30,000 km from the launch point. The weight of such a missile with a nuclear warhead can exceed one ton.

The second project, SLOB, envisages the creation of bomber-satellites for bombing ground targets with nuclear charges. It is proposed that such bomber-satellites will be placed in what, by American definition, are considered low orbits, at an altitude of up to 36,000 km, i.e. up to stationary, 24-hour orbits.

The third project, SHAOB, envisages the creation of bomber satellites for the destruction of ground targets with nuclear warheads from altitudes exceeding 36,000 km.

Piloted space carrier-bombers for nuclear/missile weapons are being studied and designed under the general program, "BOSS-10C". This program includes two basic projects: "Dyna-Soar" and "BOSS-10C". It envisages a feasibility study on the creation of non-combat space systems, of piloted combat systems, as well as of systems for support of the conduct of combat operations in space.

The "Dyna-Soar" project envisages the creation of experimental piloted glide or orbiting bombers "Dyna-Soar-1", which have a calculated flight range of 40,000 km when brought to a height of about

[redacted] 1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted]

IRONBARK

1.3(a)(4)

[redacted] 1.3(a)(4)

160 km by the modernized "Titan-2" carrier-missile. This experimental glide bomber,with a crew of two men and a flight weight of 6.8 tons, will subsequently, according to American opinion, be the basis for the develöpment of the piloted orbiting bombers, "Dyna-Soar-2", "Dyna-Soar-3" and "Dyna-Soar-Mouse", which will be maneuverable space vessels weighing 6.8 to 10 tons.

In turn, on the basis of any of these, the Americans expect to create a space bombing weapons system for the destruction of ground targets with nuclear/missile weapons. Experimental gliders are already being created under the "Dyna-Soar-1" project at the present time. Later on, in 1964 and 1965, it is proposed that test and practical models will be built for flights in space with a crew on board. It is planned to carry out 24 flights over a period of 15 years, using "Titan 2" and "Saturn" missiles. Flights of "Dyna-Soar-2" have not yet been planned under this project, but "Saturn" carrier-missiles will be used to carry them out.

It is also known that the U.S. Air Force proposes, on the basis of the "Dyna-Soar" project, to create a maneuverable space reconnaissance vehicle with a crew of three men for the reconnaissance of ground targets, for the design of which a competition has been announced. According to the U.S. Air Force tactical-technical requirements, the reconnaissance vehicle must be placed in polar orbits at an altitude of about 400 km,with the capability of maneuvering to lower orbits of 160 km for detailed reconnaissance of ground targets. It is envisaged that optical, photographic, television and radar apparatus will be used as reconnaissance equipment. It is considered advisable to process the intelligence data on board the vessels and transmit it to earth. The task of creating such reconnaissance means is to be performed by 1966.

The "BOSS-10C" project envisages a study of the feasibility of creating bombing systems to operate at altitudes of about 36,000 km. It is divided in turn into two sub-projects with the designations P-79821 and P-79822.

The sub-project P-79821 envisages a study of the feasibility of creating piloted and automatic armed or reconnaissance space systems. Three versions, which have been designated A, B and E, are being studied. They will use ballistic or glide re-entry into the atmosphere and are destined for operation at altitudes

[redacted] 1.3(a)(4)

[redacted]

1.3(a)(4)

of less than 1600 km. The designing of bombing weapons systems suitable in practice for operations at the indicated range of altitudes is being proposed on the basis of more realistic and long-term research.

The sub-project P-79822 envisages a study of the feasibility of creating piloted and automatic armed or reconnaissance space systems for the conduct of combat operations in the altitude range of 1,600 to 36,000 km. Two versions, designated C and D, are being studied, using ballistic or glide re-entry into the atmosphere. The practical design of a final version of the "BOSS-10C" piloted bombing system for the conduct of combat operations in the altitude range of 1,600 to 36,000 km is proposed on the basis of one of the more realistic versions.

It should be noted that all the projects for space bombing systems are in the very initial stage of study and research, with the exception of "Dyna-Soar", but certain of them are already being financed by the Government.

The development by the Americans of military technical means of combat in space shows that the imperialists are using technical progress mainly for military purposes and are preparing to turn space into an arena for destructive war.

The Question of the Organizational Structure of Missile Troops of Operational-Tactical Designation

by

Major-General of Artillery M. Glushkov

The experience of a number of operational and tactical exercises in recent years has greatly enriched the knowledge of our army's generals and officers in the field of operational and combat utilization of nuclear/missile weapons. At the same time, the exercises have revealed significant shortcomings in the organization and delivery of mass and group nuclear/missile strikes, both in the beginning and in the course of an operation. And such strikes are the very basis for achieving the goals of an operation.

One of the essential reasons for these shortcomings can be found in the imperfect organization of missile troops in the ground forces and the resulting difficulties of control over them by the chief of missile troops and artillery of a front (army).

At first glance it would appear that the currently accepted "harmonious" organization of missile troops in the ground forces, wherein missile units (large units) are included organizationally at all levels from division to front, should assure their most efficient combat ~~utilization~~. However, in reality this is not quite so.

Under the conditions which have evolved in the organization of missile troops of the ground forces, the apparatus of the chief of missile troops and artillery has been charged not only with the tasks of preparing, planning and directing the operational and combat utilization of missile troops and artillery,

[redacted] 1.3(a)(4)

[redacted]

1.3(a)(4)

their combat and missile-technical support, but also of their fire control (nuclear/missile strikes).

In preparing and conducting an operation, the headquarters of the chief of missile troops and artillery of an operational formation (headquarters and service of missile-artillery armament) is so loaded down with the solving of operational problems that it is in no condition to supervise directly the preparation and implementation of nuclear/missile strikes and work on the whole complex of problems of controlling missile troops and artillery to the degree necessary.

As a result of this, the chiefs of missile troops and artillery, during a number of exercises, coped inadequately with the control of missile troops, especially during the course of the operation. But can it generally be otherwise with the existing organization of missile troops? Experience from a number of exercises shows that it cannot.

Apparently we assert in vain that the functions of a chief of missile troops and artillery have become altered to such an extent that he now controls his subordinate units and large units directly. It seems to us that the experience from the exercises objectively refutes this.

One cannot combine in the same control organ (in this instance, the headquarters of missile troops and artillery) the performance of both operational and firing tasks, including the uninterrupted control of missile units during the course of the entire operation. The modest number of personnel which headquarters of missile troops and artillery possess is capable of performing only part of the operational tasks relating to the preparation of documents for planning an operation and for the operational control of missile troops and artillery during the course of an operation, while carrying an abnormally heavy workload. The headquarters

[redacted] 1.3(a)(4)

of missile troops and artillery works under the direction of a combined-arms headquarters and in cooperation with it and with the headquarters of other arms of troops and aviation in support of the operation as a whole. This is the only correct method of work, enriched by the experience of warfare, and especially by the experience of World War II.

In order that headquarters of missile troops and artillery might control the fire of missile troops directly with success, their T/O structure must be drastically revised. But try to bring the number of personnel in the headquarters of missile troops and artillery chiefs to a level where they include the T/O control points, are supplied with the necessary equipment and personnel calculated for a minimum of two positions, and you will become convinced of the inadvisability of this. In such a case, the headquarters of missile troops and artillery of a front would comprise more than 150 men, and would possess a large quantity of special vehicles and other equipment. Encumbered to the limit, it would cease to represent a part of the front (army) field command. Consequently, this way of solving the problem under consideration is not practical.

World War II gives not a few examples of successful organization of centralized control of artillery on a front and army scale. We have in mind the creation of front and army artillery groups. Thus, for example, a front long-range artillery group (FADD) was created by order of the commander of troops of the Voronezh Front in September 1942, which comprised two gun artillery regiments (152-mm guns/howitzers) and one regiment of heavy guns (203-mm). The task of this group consisted of delivering fire strikes on the decision of the front commander for the purpose of destroying enemy artillery, infantry and tanks on the major axes, which made it possible to hold Voronezh. The group played a prominent part in routing the enemy, who was striking toward the east bank of the

[redacted] 1.3(a)(4)

Voronezh River. The group's concentrated fire, ordered by decision of the front commander, made possible the fulfilment of tasks assigned to troops of the 40th and 60th armies.

But there were also great difficulties in creating a front artillery group. First of all, it was necessary to form hastily improvised control of the group, since at that time there still were no artillery large units, while the front artillery commander was unable to direct the fire of a front artillery group because of the necessity to fulfil a number of operational tasks and his direct, daily responsibilities.

A front artillery group, mainly as counterartillery, was also created on the Leningrad Front. The commander of the artillery corps, rather than the commander of front artillery, controlled its fire. This is already a higher level of organizational form for the control of attached artillery. There were similar examples on other fronts as well.

The control of fire of the artillery of an army was effected in a manner analogous to this. During the entire war, artillery was under the immediate subordination of the commander of artillery of the army, but its fire was not controlled by the commander of artillery himself and his staff, but by the commander of the army artillery group; a commander of an artillery large unit was usually appointed to this position.

It is perfectly obvious that such a system of control is the natural one, for a chief of missile troops and artillery of an operational formation cannot be transformed into the person actually controlling fire. Departing from this system of control, which has been tested by the experience of the war, we lose the chief of missile troops and artillery as a chief on an operational scale and in the majority of cases exclude his participation in the solution by the commander of

[redacted] 1.3(a)(4)

troops of the front (army) of very important and constantly arising problems in the preparation of an operation and during the course of it.

In our opinion, the experience of a number of exercises in recent years has persistently revealed the necessity of improving the organizational structure of missile troops.

Instead of front and army missile large units and units, which, by their composition and the feasibility of controlling them, fail to provide the necessary combat efficiency and precision in the delivery of massed nuclear strikes in the most important periods of an operation, we propose having missile corps and missile divisions in the ground forces.

A missile corps must be of such a composition that, when integrated into the composition of a front, it can fully cope with tasks assigned to the missile troops of a front in an operation.

A missile division must have a composition which assures the performance of tasks in the operation of a front which is functioning on a secondary axis, or in an independent army operation (of a separate army).

Where major missile large units are available, the chief of missile troops and artillery of a front will effect fire control of missile troops through the commander of the missile corps (division), while he himself, with his apparatus, can more thoroughly resolve problems in the utilization of missile troops and control of them in an operation, working with his apparatus within the field command structure of the operational formation. A missile corps, in our opinion, can comprise the following:

-- 4 or 5 missile brigades with a range of fire up to 300 kms;

[redacted] 1.3(a)(4)

[redacted]

IRONBARK

1.3(a)(4)

[redacted] 1.3(a)(4)

-- 1 or 2 missile brigades with a range of fire up to 600 kms;

-- 1 or 2 missile brigades with a range of fire up to 1200 kms (all three types of brigade would consist of three battalions)

-- 1 or 2 regiments of cruise (krylataya) missiles (five-battery composition) with a range of fire up to 800 kms;

-- a missile-technical division containing 6 to 8 PRTB /mobile technical-repair bases/ and two or three missile depot (parkovyy) battalions;

-- a regiment of pilotless reconnaissance means;

-- a regiment of radiotechnical intelligence;

-- a regiment of radiorelay and radio communications.

We propose such an organization of a missile corps as one of the possible variants. We base this only on the average possible conditions for the conduct of an operation in the West European Theater of Military Operations, and in keeping with this, on the possible tasks of the missile troops of a front.

The necessity for including reconnaissance means in the composition of the proposed missile large units is explained by the following. In order to perform tasks effectively with nuclear/missile weapons, i.e., exploit their possibilities to the utmost, one must know where, when and how best to deliver a strike. This is possible only when reconnaissance means are adequately represented in the composition of the missile corps.

But at the moment, a situation has developed wherein missile troops, which are the basic arm of troops utilizing nuclear weapons, receive only the

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

coordinates of a strike and the order to fire (launch) in the vast majority of cases. Even the commander of a missile brigade does not know the target against which he is delivering a strike. This comes about because problems of reconnoitering targets (objectives) have been separated from problems of their destruction. Everyone is conducting intelligence collection in support of missile troops except the missile troops themselves, for they dispose of no intelligence collection means.

Such a situation cannot be considered normal, since the intelligence process must be organically linked with the process of carrying out a strike, and responsibility for the whole process must be placed on one specific person. At the moment, however, the credibility of intelligence data, continuity of intelligence collection, and its timeliness are not the responsibility of the element which carries out the strike. When this is so, that element cannot bear full responsibility for striking the targets.

Has one of the decisive arms of troops ever fought with closed eyes? No. It is all the more inadmissible to do this now.

In a future war, when events will develop with exceptional mobility, the coalescence of technical intelligence facilities with the means of destruction will become vitally necessary. That is why intelligence means of all types must be represented as fully as possible in the composition of a missile corps.

Sometimes it is considered that pilotless means of reconnaissance can be under immediate subordination of a chief of missile troops and artillery of a front, but the question of how and by whom these means will be supported technically remains open for the time being. This can be resolved with comparative ease within the framework of the proposed organizational

[redacted] 1.3(a)(4)

structure of missile troops, to the extent that this question is most closely related to missile-technical supply.

The combat composition of the corps requires no special commentary: brigades with a range of fire up to 300 kms will be utilized as a means of reinforcing armies, while brigades with great ranges of fire will be used on the basis of the front commander's decisions.

The necessity of having missile large units with a range of fire up to 1200 kms in the composition of the ground forces should be emphasized. This is occasioned by the fact that part of the important objectives marked for destruction in support of a front operation are located beyond the boundaries of its depth. Moreover, it should be kept in mind that conditions for the subsequent offensive operation should be prepared during the course of an operation. The presence of missile large units with a range of fire up to 1200 kms within the composition of troops of a front will greatly expand the possibility of maneuvering missile/nuclear fire, not only in the zone of operations of their own front, but also in the zone of adjacent units, as mutual fire support.

The regiments of cruise (krylataya) missiles which are proposed for the composition of a missile corps will carry out tasks of front significance, destroying objectives which are suitable for this type of missile.

It is especially necessary to consider missile-technical support, because this question cannot be considered apart from the fulfilment of combat tasks assigned to missile troops.

Taking into consideration the experience of a number of exercises with the practical assembly and delivery of missiles to launching positions inclusively,

[redacted]

IRONBARK

1.3(a)(4)

[redacted] 1.3(a)(4)

and also on the basis of technical requirements and the capabilities of modern missile-technical units and large units, we come to the conclusion that it is practical that a missile corps contain a missile-technical division with the required number of PRTB's and missile depot battalions.

In our opinion, the proposed organization of missile troops will lead to the correct resolution of all problems connected with comprehensive support of missile troops in an operation, and facilitate overall solution of the problems of reconnoitering objectives (targets). It will increase responsibility for timely readiness and the effectiveness of missile/nuclear strikes, free operational staffs and organs of supply from performing inappropriate functions; and simplify the organizational structure of field commands of operational formations (front, army).

We have no doubt that such an organization of missile troops will afford a significant economy of state funds. It will require a smaller number of units being activated, since it will permit the performance of tasks on various axes by maneuvering missile large units. The existing organization of missile troops leads to the unjustified holding of missile large units in passive sectors of military operations or in the composition of formations in reserve, in the process of being activated, etc.

We are not touching on the question of the organizational structure of tactical missiles at all, as it has been solved successfully, in our opinion. Only the organization of missile-technical support of tactical missiles gives rise to doubts. It can also be improved by creating an army PRTB of the appropriate composition.

Problems of the Strategic Deployment of Armed Forces In Modern Warfare

by

Major-General Kh. Dzhelaukhov

Our press has devoted adequate attention to the problems of strategic deployment as an important element of the preparedness of the armed forces for war. [1] The publication of a work entitled "The Strategic Deployment of Armed Forces in a Modern War", by a group of authors under the direction of Lieutenant-General K. F. Skorobogatkin, represents a continuation of efforts to study the problems mentioned.[2] With its appearance, the large gap which existed in the complete scientific elaboration of one of the most important sections of Soviet military strategy - the theory of strategic deployment - has been filled.

The book consists of an introduction and ten chapters.

The first chapter is devoted to an analysis of the strategic deployment of armed forces in the 2nd World War. In it are examined the strategic deployment of both sides in the German-Polish War of 1939, on the western frontier in 1939-1940, and the strategic deployment of the German-Fascist troops and of the Soviet armed forces in 1941, to which the main attention is devoted.

One of the important conditions in the strategic deployment of the German-Fascist Army, arising from the aggressive nature of German imperialism, was the camouflage by all possible means of military preparation for aggression, and

the protraction of the process of strategic deployment. For example, the strategic deployment of German-Fascist troops on the German-Polish border continued for about two months, while in the west, against France, and in the east, against the Soviet Union, it continued for 5 to 6 months.

The build-up of the German-Fascist troops on our border was carried out gradually. Troops destined for the offensive on the first day of the war were brought up in four echelons (from 4 February to the beginning of June 1941). Movement was carried out exclusively at night, with the strict observance of camouflage measures. By 21 June, the German-Fascist troops were ready to take up the offensive.

Thus, a new factor in strategic deployment during the 2nd World War was represented by its protraction over an extended period.

In speaking of the shortcomings in the Soviet Army's strategic deployment in the summer of 1941, the authors make a number of most valuable critical comments, which are useful even today. The reality of the threat to the Soviet Union posed by Fascist Germany called for the adoption of appropriate measures to strengthen our defense. This was all the more true, since, when "... German-Fascist troops were brought into Rumania and Finland, as early, that is, as Autumn 1940, our country found itself in a threatened position. The enemy was able to forestall us in strategic deployment and to catch us unprepared to ward off a sudden blow. Yet, decisive measures to bring our armed forces to combat readiness were not taken. Instead of a full, planned and concealed mobilization of large units and units, which could have been carried out in different military districts at various times for the sake of camouflage, we began hastily to call up those who were registered (pripisnoy sostav) in the internal military districts in May 1941 and to transport to theaters of military operations divisions which were not yet cohesive, which were inadequately prepared for combat operations, and which were without rear services and transport..." (page 41). Further on, on pages 42 to 56, the

1.3(a)(4)

authors examine the basic shortcomings in the strategic and operational deployment of our border military districts on the western border and evaluate the condition of the types of armed forces, the extent to which they were equipped, and the degree of their combat readiness. From this, the conclusion is drawn that: "The experience gained from strategic deployment of our armed forces in 1941 shows that deployment has acquired decisive importance under modern conditions and has become a most complex and crucial measure for the State." (page 56).

It should be noted that the lamentable experience of the preparation and deployment of our armed forces in 1941 is fully taken into consideration by the Central Committee of our Party and by the Soviet Government. "The tragedy of the first months of the 2nd World War, when Hitler attacked the USSR after assuring himself of superiority in combat equipment, is too fresh in people's minds for this to be permitted now", — states the Declaration of the Soviet Government of 31 August 1961. Therefore, in view of the reinforcement of the armed forces of the U.S.A. and of its partners in NATO in Europe, and the performance of other hostile actions in response to the proposal of the Soviet Union for the conclusion of a peace treaty with both German nations, our Government was obliged to undertake a number of grave measures to reinforce the security of the USSR and to heighten the combat readiness of the armed forces. This found concrete expression in the temporary retention in the army of some contingents due for discharge in the autumn of 1961, in a partial call-up for service from the reserve, in the reinforcement of troops of the border military districts (groups of forces), in the conduct of maneuvers participated in by all arms of troops, including troops of the countries participating in the Warsaw Pact, and in the resumption of experimental nuclear explosions.

The second chapter is devoted to a brief study of the nature of a future war and of the probable deployment of the types of armed forces of the imperialist aggressive blocs in the respective theaters of military operations. Naturally, the contents of this chapter are of a conjectural nature, since the real plans of the imperialist blocs are kept in

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

strict secrecy, while the numerical composition of the armed forces in the various theaters changes periodically. Nevertheless, a correct orientation is given on the major theaters of military operations, on the probable forces and means deployed in them, and on the possible nature of armed combat by the enemy during the period of strategic deployment.

The third chapter, "The Essentials of Strategic Deployment", is, in our opinion, the main chapter in the book. Its value lies in the fact that it reveals the content and essence of the modern concept of strategic deployment, based on criticism of concepts of strategic deployment which have grown up historically.

The author's point of view can be summarized by the statement that "... strategic deployment is the process of the setting up--by the beginning of a war, of strategic groupings of armed forces, including their concealment, mobilization, concentration and deployment" (page 91). In principle, such a definition characterizes quite completely the content and essence of strategic deployment. It emphasizes that strategic deployment represents the single process of setting up groupings of armed forces, by the beginning of a war, in which there are separate, individual elements which are closely interconnected.

In the view of the authors, the entire process of setting up strategic groupings under modern conditions presupposes, in the first place, that part of the peacetime armed forces is at full combat readiness and is capable of repulsing a sudden attack by the enemy, of delivering an immediate strike and of conducting the first operations, and, in the second place, that full mobilization, transport (concentration), and deployment of new contingents of the armed forces in the theaters of military operations are carried out in accordance with the operational plan for the war.

The relationship which should exist between regular troops, ready for immediate operations, and those troops which are being mobilized and transported to the theaters

of military operations can be debated. But the nature of this relationship will not change the essence and content of the strategic deployment itself. Whatever the conditions (here we are thinking of a modern world war) it is not possible to reject the carrying out of mobilization entirely or, consequently, the need to transport and concentrate troops into various theaters of military operations and to set up the groupings necessary for the performance of strategic tasks.

The objection can be made that under modern conditions strategic deployment will not always be carried out according to the proposed plan.

There are regular large units of various types of armed forces which are maintained above strength or at wartime strength in peacetime and ready for immediate operations. Consequently, the process of mobilized deployment does not, in essence, apply to these troops. This can be explained as follows: in the first place, the regular troops mentioned comprise only a part of the first strategic echelon deployed in accordance with the operation plan; in the second place, even these completely combat-ready troops will, in some cases, need the supplementary mobilization of some rear units, establishments, communications or service units and subunits etc.; in the third place, the mobilized deployment of the regular large units mentioned has actually been carried out in good time, i.e., long before the time for the strategic deployment of our main armed forces. Thus, the presence of regular, combat-ready large units and formations of types of armed forces actually deployed in theaters of military operations and in the depth of the country, does not contradict the definition of strategic deployment given by the authors in their book.

In our opinion, greater emphasis should have been given to the dual nature of the process of strategic deployment, which includes on the one hand the deployed forces and means of groups of forces, of border military districts and of the other regular formations in the country which are ready for immediate operations; and on the other hand,

[redacted]

1.3(a)(4)

[redacted]

IRONBARK

1.3(a)(4)

1.3(a)(4)

[redacted]

of the mobilization and formation of new large units and units, of their transportation and concentration in theaters of military operations, and of their combat deployment independently or within the composition of regular troops already there. This, essentially, is the first strategic echelon of the armed forces.

The whole process of creating strategic groupings occupies a secondary position, and it must not be transformed into something self-contained, equatable with a plan of war, as was done by Professor Melikov in his work "Strategic Deployment".[1] Strategic deployment is planned and carried out on the basis of the general plan for strategic operations, which are the direct expression of the military-political goals for the initial period of war in any given theater of military operations. Its content is decisively influenced by the nature of a future war, by the military doctrine which has been adopted in a given country, and by the plan for impending strategic operations. Strategic deployment is the concluding act of peace and the initial act of a war.

The essence of the operational plan is shown in the boldest relief by the nature of strategic deployment. Thus, from the very beginning of a war, the plan finds its material expression in the deployment, which, in turn, is carried out in the name of those strategic operations which are provided for in the operational plan. In this sense, although strategic deployment is one of the most important elements in the preparation of the armed forces for war, it occupies a dependent, subordinate position in the theory of strategy, as well as in its practical realization. Nevertheless, elaboration of the problem of strategic deployment under the conditions of modern warfare is extremely urgent, and the value of the book under review lies precisely in the fact that the authors have elaborated this little-studied topic with sufficient fullness and have

1. Professor V. A. Melikov, Division Commander, "Strategic Deployment, 1st World War 1914-1918" Volume 1, Military Publishing House, 1939.

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

presented their views on all the basic questions of the theory of strategic deployment.

The experience of recent wars shows that, as a rule, an operational plan undergoes changes during the course of its realization. An example of this is represented by the operational plan of the Polish command in 1939, and by our own plan, which underwent a radical change after the beginning of the war.

From this it follows that, under certain circumstances, strategic deployment, as a derivative of an operational plan (the plan for the first operations), can exert a substantial influence on the realization of the plan itself. It is possible to possess an ideal operational plan and yet to suffer defeat, if the armed forces delay in completing their strategic deployment.

It is known that in a modern war it may be necessary to mobilize a second, and possibly even a third, strategic echelon to reinforce existing strategic groupings or to set up new ones.

The experience of the world wars shows that strategic deployment in new theaters of military operations took place during the course of these wars (the deployment of the German-Fascist armed forces first against Poland, then against the West, and, finally, against us; our deployment in the west and, in the summer of 1945, in the Far East against Japan). Such a phenomenon is defined by the authors as a successive strategic deployment during a new war (page 92). This is, in essence, a new deployment in a new theater of military operations during the course of a major war. One cannot but agree with such a definition. In this connection, this is an appropriate place to examine the concept of mobilization and to elaborate upon the definition of strategic deployment.

A careful comparison between the concept of mobilization (page 96) and the formulation of the concept of strategic deployment (page 91) reveals a certain discrepancy.

It is envisaged that strategic groupings will be created by the beginning of a war or at its outbreak, while the concept of mobilization includes various measures which are connected not only with strategic deployment (for example, the creation of reserve troops for the replacement of losses and the establishment of new units to fill out existing strategic groupings). From what has been said, it follows that mobilization is a more protracted process than strategic deployment. The authors themselves take this point of view and give a stage-by-stage account of the entire process of mobilization. The reference to Professor Mikhnevich (page 90), stating that strategic deployment consists of the mobilization of an army and of its concentration in a theater of war, provides only a relative explanation of the thesis advanced by the authors that mobilization is an element of strategic deployment, since such a definition is justified to a certain degree only when related to the past. It is necessary, therefore, to emphasize that mobilization is a composite element of strategic deployment in its initial stage, i.e., while strategic groupings are being set up in accordance with the operational war plan. However, mobilization cannot be entirely incorporated in strategic deployment since the latter is a relatively short-term measure for the initial period of a given war.

Mobilization occupies a special place in a country's system of preparation for war. Since it provides for the bringing up to their authorized wartime strength of large units, units and establishments existing in peacetime and for the creation of new formations, intended to replenish and reinforce the groupings of the armed forces which perform tasks in the opening operations, this part of mobilization is to this extent a component element of strategic deployment. However, as we know, mobilization continues further. If we are not to take the point of view of "permanent mobilization", that is, of measures for mobilization carried out throughout the entire course of the war, then we must concede that mobilization can certainly not be enclosed within the framework of strategic deployment in terms of time and of the measures being

[redacted]

IRONBARK

1.3(a)(4)

[redacted]

1.3(a)(4)

carried out. In this connection, the authors should have elaborated upon the formulation of the concept of strategic deployment and its elements. In our opinion, when listing the elements of strategic deployment, instead of referring to "the mobilization of the armed forces", or simply to "mobilization", one should speak of "mobilizational deployment", understanding by this all measures for mobilization taken at the beginning of a war, in order to ensure the deployment of strategic groupings in accordance with the operational war plan.

As regards the mobilization and deployment of the second and subsequent echelons carried out during the course of the war, the latter will be intended for the reinforcement of strategic groupings already in existence. If the strategic echelons mentioned are intended to open a new front of armed combat, one can clearly speak of deployment in a new theater of military operations against a new enemy and, essentially, in a new war (during the course of a world war). Thus, the concept of strategic deployment as the creation of groupings by the beginning of a war is justified in this instance also.

In the fourth chapter, fairly detailed examination is given to the problems of the preparation for and planning of strategic deployment; of the preparation of a nation's territory for strategic deployment, and of the deployment of types of armed forces and of the rear services.

Chapter five reveals the elements of cover, which are understood as actions by a unit of the armed forces at a high degree of combat readiness to support mobilization, concentration and deployment in the event of a sudden attack by the enemy from the air, land or sea.

In past wars, cover was effected by large units which were especially assigned for this purpose. The tasks of cover became extremely complicated with the development of military technology, the appearance on a mass scale of air forces, of tank and motorized large units, of naval submarine forces and of airborne landing troops. Along

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

with cover from land and sea there arose the necessity for cover from the air as well. By the 2nd World War it had already outgrown operational boundaries and had extended to a considerable depth into the territory of a country within the range of the bomber aircraft which existed at the time. Under these conditions, cover changed from something of local importance, intended to create a favorable setting for the deployment of troops in shallow zones of theaters of military operations, and acquired the significance of an important strategic measure throughout the entire country, especially for countries with small territories. Cover has become all the more complicated in the age of nuclear/missile weapons. It has become an important component of a country's defense. At the same time, cover, by performing specific functions to support the complete mobilization, concentration and deployment of troops, forms a constituent of strategic deployment. This dual nature of cover leads certain comrades into confusion: to negation of the particular functions of cover and to its equation with national defense as a whole.

It seems to us that in defining the concept of cover, the authors have, intentionally or not, expanded its functions. This is particularly noticeable in the section in which cover from the air is examined. Here a full picture is given of the cover (defense) of the entire territory by the antiair defense troops of the country in cooperation with other forces and means, but no emphasis is given to the special nature of cover which is carried out to help strategic deployment in the overall defense system of the nation. This should have been done, since incorrect views exist equating cover from the air with antiair defense in general, and cover on land and sea with the defense of troops in the appropriate theaters of military operations.

The fact is that, as an operation by a unit of the armed forces intended to support mobilization, concentration and deployment, cover has a specific purpose-- to support the deployment of one's own armed forces and, also, to create operational-strategic groupings for military operations in

[redacted] 1.3(a)(4)

the depth of the country, in accordance with the operational plan. Upon the conclusion of strategic deployment, cover is discontinued and the troops detailed for this purpose go over to the performance of other tasks specified in the operational plan. In this sense, cover is a temporary military operation: it begins in the period of threat (ugrozhayemyy period) and ends when the major groupings of the armed forces go over to the performance of their tasks in an operation. It should also be noted that in various theaters of military operations and for different types of armed forces the boundaries of space (territory) and time and the forces and means for cover will vary. Because of this, the tasks of cover will be performed differently. Along those axes of a theater of military operations on which offensive operations by ground forces are planned in the initial period of war, the tasks of cover will be performed by a part of the forces carrying out the offensive operation: periods for the fulfillment of tasks of cover will, obviously, not be of great duration. In those theaters of military operations and on those strategic axes where it is intended to organize strategic defense during the initial period of the war, the basic forces for cover will, as a rule, be the same troops as are charged with the conduct of defense.

Tasks for cover in naval theaters of operations will be performed in a similar manner.

Cover from the air is being performed on a continuing basis during peacetime. At the outset of military operations the troops of the antiair defense of the country will perform specific tasks with part of their forces to cover the mobilization, concentration and deployment of the armed forces at the same time as they are carrying out the tasks of covering the territory of the whole nation from air strikes. A significant proportion of the forces and means of the antiair defense troops will also be used for cover from the air.

The fundamental principles of the mobilization of armed forces are elaborated in chapter six. The authors

[redacted]

1.3(a)(4)

regard it as the deployment of the armed forces to a strength which ensures the achievement of the political purposes of the war, and which includes bringing peacetime large units and units up to wartime strength; the formation of new large units, units and establishments based on concealed cadres; the creation of a large troop reserve to replenish large units who have lost their combat effectiveness and for the formation of new units.

In chapter seven, the authors make a detailed examination of the concentration of troops as one of the important elements of strategic deployment. Concentration is understood as the assembly of forces and means in theaters of military operations in order to bring the groupings of armed forces already there up to the required strength and to ensure their rapid deployment.

The concentration of troops in theaters of military operations from disposition areas or from areas of completed mobilization will be carried out by available facilities (svoim khodom) in organic truck transport and through the mass transport of formations and large units by railroad. When navigable rivers are available, and in coastal theaters, river (sea) transport can also be used. The authors emphasize that as a result of major destruction of transport from strikes by nuclear weapons and aircraft, strategic concentration under modern conditions is an extremely difficult and complex matter.

The process of concentration (transport and movement) is closely linked with full mobilization, with the preparedness of the troops for transport, and with the general concept of the initial operations — the idea of strategic deployment.

The implementation of transport, therefore, depends not only on technical conditions and on the degree of destruction of transport facilities, or the need to transport a large quantity of troops in a short period of time, but also on the preparedness of the troops for transportation and on those changes in strategic deployment which are unavoidable under modern conditions. The major problem of concentration is preservation of the viability of transport and the skillful

use of all its categories. The experience of past wars, the modern state of transport, and the various measures destined to strengthen our armed forces, show that the most probable procedure for carrying out strategic concentration will be a mixed one, by which concentration of a part of the armed forces can be accomplished before the beginning of hostilities, and of the rest when hostilities begin. It is clear that when a threatening situation arises (or even before this) a part of the armed forces will be fully mobilized in secret and brought to the theaters of military actions. Sometimes, the concentration of troops can also be carried out openly, with the aim of exerting pressure on the enemy, in order to force him to give up aggressive operations which he is undertaking.

In any event, it is necessary to keep in mind the fact that a secret, slow concentration is not an end in itself. The international situation and the conditions under which a war breaks out can compel one to carry out transportation openly in the shortest possible time and in a massive flow, in order to forestall the enemy in the deployment of his basic strategic groupings.

In view of the need for the extensive and comprehensive use of all types of transport to achieve the prompt concentration of troops, the decision to concentrate the use of all types of transport, including trucks, in the hands of the Central Directorate for Military Communication, with unified planning as a basis, the decision, in other words, to have a single military transport center, seems to us a correct one.

Chapter eight of the book is devoted to the combat deployment of the armed forces.

The main substance of combat deployment is the creation, in theaters of military operations and in the depth of the country, of appropriate groupings of the armed forces, the assembly of strategic and operational formations and their occupation of departure areas in readiness to perform the tasks assigned by the operational plan in the opening operations

of the initial period of the war.

On pages 99-100 and in chapter eight (pages 229-255), the authors have introduced the concept of "combat deployment" ("boyevoye razvertyvaniye"), investing it with a wider connotation than that of operational deployment. "Combat deployment (as an element of strategic deployment) should be taken as meaning the creation of a specific assembly of forces and their occupation of an initial position for the conduct of combat operations of differing scales" (page 100). One could accept or dispute this definition. The one thing which is clear is that strategic deployment can only be considered complete when it has been brought to the stage of operational-tactical deployment and of the creation of groupings of troops for the performance of impending tasks.

We agree with the authors when, basing themselves on the principle of deep-echeloned strategic deployment, they divide the armed forces deployed in a main theater of military operations into two operational echelons. It has already been stated above that the first strategic echelon of the armed forces should consist of a number of operational echelons. It is natural that the first operational echelon should incorporate all the regular large units of the strategic missile troops, groups of forces, border military districts and naval forces, and of the antiair defense troops, which are at constant combat readiness. The formations and large units which are deployed closer to national boundaries will be made up of covering troops, while the troops located deep in the theaters of military operations will be made up of the main forces of the first operational echelon. The second operational echelon will be composed of formations and large units of the internal military districts and of some large units of the border military districts which need to complete their mobilization. Irrespective of the availability of troops comprising the first and second operational echelons, strategic reserves of all types, subordinate to the High Command, may be deployed in the theaters of military operations.

Depending on the plan proposed for impending operations, combat deployment must support the conduct of any and all operations. At the same time, combat deployment and the

creation of operational-strategic groupings must be sufficiently flexible to permit rapid transition to an alternate deployment plan conforming to new conditions at the beginning of a war if the proposed plans are nullified. The complexity of such a supplementary or new deployment is confirmed by the experience of the 2nd World War. It will be even harder to accomplish under modern conditions.

A theater of military operations, particularly one in a zone in which deployment is impending, must be prepared ahead of time so that combat deployment can be carried out in a compressed time period and in order that one's own armed forces may be used as effectively as possible at the beginning of operations. Missile troops, artillery, aviation, and combined-arms large units intended for an opening strike must have the advantage of being assured of deployment in good time (in engineering, communications and material-technical respects).

In chapter eight, the authors examine specific problems of the combat deployment of types of armed forces on the basis of experience from the 2nd World War, from postwar exercises, and from an analysis of the possible nature of deployment in a future war.

A great virtue of the book under review is that the collective authors constantly bear in mind the importance of material-technical support and of the rear area in strategic deployment. These problems are also examined in a special, ninth chapter "The Deployment of the Rear Area of Armed Forces".

By deployment of the rear area of the armed forces is meant the full mobilization of rear services large units, units and establishments, their concentration and deployment in the theaters of military operations for materiel, technical and medical support of the troops. It is explained that the deployment of the rear area should correspond to the concept of the operations planned, to the grouping of forces and to the degree of combat readiness of the large units and formations.

Thus, there should be a minimum of prepared units and establishments of the rear services in each border military district (group of forces) so that support can be given to the large units and formations in their opening operations, pending the complete deployment of the rear areas in the particular theater of military operations.

The tenth and last chapter is devoted to the problems of the control of armed forces in the period of strategic deployment.

As the authors correctly point out, the complexity of the control of armed forces in the period of strategic deployment lies in the fact that powerful nuclear/missile strikes will probably be being delivered and the formations of types of armed forces which are at constant readiness will probably be conducting the opening operations simultaneously with the full mobilization, concentration and deployment of the troops. During this period control must be exercised on the basis of plans drawn up in peacetime, taking into consideration the actual developments of the situation at the beginning of a war. Major difficulties in the control of deployment can arise because of great destruction of transport, or an abrupt change in the military-political and strategic situation. The operational plan in individual theaters of military operations may therefore be partially changed, and consequently the introduction of changes into the plans for concentration and deployment may also be required.

Thus, the entire system of control must be as stable as possible, in order to withstand strikes by modern means of armed combat and to preserve continuity at all levels in the complex situation of the initial period of a nuclear/missile war.

In conclusion, it should be noted that the book is written from the vantage point of Marxist-Leninist teaching on war, in the light of the requirements of the Central Committee of the CPSU and of our Party documents, and reflects modern views on the problems of strategic deployment in a future war with complete correctness.

SOURCE : A reliable source (B).

Following is a verbatim translation of an article titled "Some Thoughts on the Development of the Soviet Army Tank Troops", by Marshal of the Soviet Union R. Malinovskiy.

This article appeared in the 1962 First Issue of a special version of the Soviet military journal Voyennaya Mysl (Military Thought). This journal is published irregularly and is classified TOP SECRET by the Soviets. The 1962 First Issue went to press on 29 December 1961.

Headquarters Comment: Military Thought is published by the USSR Ministry of Defense in three versions, classified RESTRICTED, SECRET and TOP SECRET. The RESTRICTED version has been issued monthly since 1937, while the other two versions are issued irregularly. The TOP SECRET version was initiated in early 1960. By the end of 1961, 61 issues of the SECRET version had been published, 6 of them during 1961.

Some Thoughts on the Development of the

Soviet Army Tank Troops

by

Marshal of the Soviet Union R. Malinovskiy

The development of armored equipment attains exceptionally important significance under modern conditions, and it is completely natural that lately, in our classified military press, a discussion of this question has started. The fact that our prominent military leaders participated in the discussion of the vital problems of developing our Armed Forces, including the tank troops, should be welcomed. We should never forget that truth is born of controversy, and even more so when we use such a tested weapon as Marxist-Leninist dialectics. The discussion of these questions attained such an active nature that it cannot be disregarded. Therefore, we decided to join in it and to share some of our thoughts concerning this. It goes without saying that we have not assigned ourselves the goal of giving the final, categorical conclusions on all these questions.

The discussion concerns the problems of developing armored equipment, the development and intent of tank troops, their organizational structure, and methods of their employment in warfare. The most varied and contrary opinions have been expressed. The opinions of some comrades have split on several problems. Some boteheads consider that the development of tank troops has been turned into a serious problem, and one can even hear the voices of certain ultra-innovators who say that the tank has outlived itself and its development has reached a dead end. All this is quite understandable; we are living through such a difficult period in the development of military

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted] 1.3(a)(4)

art that it is not so easy to find the right path, as it seems at first glance.

Lately, Soviet military art has been developing rapidly in connection with the creation of new combat weapons. We cannot lag behind this development. It should be taken into consideration that people always accept new ideas with difficulty, despite the fact that people are the creators of these ideas. Also, rash conclusions and categorical assertions having little validity should not be tolerated because they can lead us to large errors which are hard to correct. Therefore, it is essential to approach the problems under discussion profoundly and comprehensively, especially the conclusions that result from the discussion. Comrades should not be censured for their statements and suggestions that seem foolish at times ——(circa ½ page of original text missing).

During further development and technical improvement of tanks, the great potentialities incorporated in them for conducting mobile combat operations became evident. Therefore, in the period preceding the Second World War much attention was given to the development of tank troops in the major countries of the world. A great number of tanks possessing high combat qualities appeared on the battlefields of the Second World War. The massed employment of tanks, supported by powerful air strikes and artillery fire, permitted a successful resolution of the problem of breaking through the defense and developing an offensive to a great operational depth. As a result of this, the Second World War, with the exception of certain periods, basically had a mobile nature.

The main positive result of mass employment of tanks in the past war consists of this.

Simultaneously with the development of tarks, weapons for combating tanks, antitank weapons, were

[redacted] 1.3(a)(4)

[redacted]

1.3(a)(4)

being developed. Over a prolonged period of time there has been a persistent competition between the tanks and the antitank weapons. During the years of the Second World War, despite the mass employment of fairly effective antitank weapons, the tanks stood up to them and retained their overwhelming superiority until the end of the war.

In order not to make a mistake in evaluating the combat characteristics of our modern tank troops and in determining the direction of their future development, let us briefly examine the path followed by them in the Second World War. This will also help us reveal some lessons of history that should not be forgotten.

The tank troops of the Soviet Army played an outstanding role in the defeat of fascist Germany's armed forces. Possessing such remarkable qualities as high mobility, great firepower, and good armored protection, the tank troops became the main strike force of our ground forces.

The skillful employment of great masses of artillery and aircraft to neutralize the enemy defense, followed by a massed tank attack in close coordination with infantry, ensured the successful breakthrough of the fascist German troop defense. Tank troops played an especially great role in developing the breakthrough and finally defeating the opposing enemy groupings. These troops were the leading force in conducting operations to a great depth at high speeds. Tank armies and tank and mechanized corps, led into the breakthrough and led by brave and courageous commanding officers, always decisively rushed into the enemy's operational depth, encircled and broke up his main groupings, routed the reserves, and captured important areas and lines. Such employment of tank troops gave a mobile nature to the operations of the Second World War, permitted the swift achievement of the defeat

[redacted] 1.3(e)(4)

[redacted]

IRONBARK

1.3(a)(4)

[redacted]

1.3(a)(4)

of enemy operational groupings, and the penetration of the operational formation of his troops to a great depth in a short period of time. The tank troops have the right to be proud of the results of their operations in the Second World War.

In the past it was said about the cavalry: "the glorious history of cavalry is the history of its commanding officers". This aphorism refers to the tank troops to an even greater degree: an indecisive commanding officer at the head of a tank army, tank corps, or tank division is a most frightening, a most fatal thing. No matter how perfect armored equipment is, an indecisive commanding officer at the head of the tank troops cannot ensure their successful combat employment. We should always firmly remember this condition. The decisive factor that ensured the successful employment of tank troops in the Second World War, however, was the high level of Soviet armored equipment. Socialist industry and our designers armed the tank troops with splendid tanks and assault weapons. It is generally known that not a single foreign state, that actively participated in the Second World War was able to achieve the same high level in the development of armored equipment as was achieved in the Soviet Union.

The Soviet Army entered the war having three types of tanks: light (BT and T-26 and a little later the T-60 and T-70), medium (T-34), and the heavy (KV). The medium and heavy tanks were considered to be the basic ones. However, there were extremely few of these tanks, and at the beginning of the war the basic part of our tank pool was composed of light tanks that were obsolete by that time. This was already evident from the experience of the Spanish Civil War in 1936 to 1939. It is true that not all the highly placed military leaders understood this. Many of them considered that we did not need better tanks and that war could be conducted with the existing tanks.

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

Such leaders hindered tank development but a sober calculation overruled them, and, as is known, before the war our tank troops began to be rearmed with new types of tanks. However, we were unable to complete this by the beginning of the fascist German attack because time was lost.

Our medium T-34-76 tanks and heavy KV tanks which were completely modern at that time and, with their comparatively powerful armament and better armor protection, proved to be more powerful in single combat with German T-III and T-IV medium tanks. They also suffered fewer losses from antitank weapons than the German tanks.

All this indicates that we took the correct direction in the development of armored equipment on the eve of the war. It ensured a qualitative superiority for us in armored equipment over fascist Germany at the beginning of the war. In the initial period of the war, however, because of a whole series of great mistakes connected with Stalin's personality cult and his military environment (voyennoye okruzheniye) which permitted the treacherous attack of fascist Germany, the Hitlerites were able to achieve considerable superiority in the number of tanks, especially on the main axes, and also in the methods of their combat employment over the Soviet Army. This affected the operations of our troops very adversly and led us to serious defeats in the initial period of the war.

It is essential to note that by the summer of 1943 the fascist army was armed with new "Panther" and "Tiger" heavy tanks and also with "Ferdinand" assault guns, which had better armored protection and more powerful armament while our tanks fundamentally remained the same. On the eve of the Kursk battle a certain qualitative superiority in armored equipment temporarily passed into the hands of

fascist Germany. It was under these disadvantageous conditions that this outstanding tank battle occurred which ended, however, with the greatest defeat of fascist Germany. The backbone of Hitler's Germany was broken in this battle.

The qualitative superiority of the German tanks over our tanks did not last long. Already in 1944 mass quantities of T-34-85 tanks began to arrive with an 85 mm gun that was good for that time. The new IS heavy tank, armed with a 122 mm gun and having powerful armored protection, arrived to replace the KV tanks. The German "Panthers" and "Tigers" and also "Ferdinands" could no longer compete with our new tanks. It is true that the T-VI-B heavy tank, the "King Tiger," which had approximately the same armored protection as our IS tank, became part of the German equipment. But the German tank was armed with an 88 mm gun, and its weight reached 68 tons as opposed to 46 tons for our IS tank. Besides, there was only a limited number of T-IV-B heavy tanks in the German Army. At the same time, a large number of assault guns, including heavy ones, became part of our army's equipment. All this ensured the reliable superiority of our armored equipment over that of the Germans until the very end of the Second World War. Our industry also ensured the quantitative superiority in tanks over fascist Germany and its allies.

The tank equipment of our allies in the last war — the British and American tanks — were also inferior to our tanks. The basic British tanks; MK-III (Valentine) and MK-IV (Churchill), had weak armament (a 57 mm gun) and low speed (26 to 32 km per hour). The American (M4A2 and T-26-E3) tanks were superior to the British tanks in armament (75 mm and 90 mm guns) and had a greater speed; however, they also were inferior to our tanks in maneuverability, armament, dimensions, and were

[redacted] 1.3(a)(4)

very heavy. The Soviet tanks had powerful diesel engines installed in them, and at that time this was something quite advanced in world tank building.

Consequently, during the years of the Second World War, Soviet tank building firmly occupied first place in the entire world. It provided our army with remarkable combat vehicles — tanks and assault guns, which aided the successful conduct of war against fascist Germany.

Parallel with the development of tanks during the Second World War antitank weapons were being developed. As is known, we began the struggle against fascist tanks with bottles of flammable mixture, with antitank grenades, bunches of regular hand grenades, antitank rifles, etc, which, strictly speaking, required single combat of a man against tanks. We did not have any alternative. For that reason, we used divisional 76 mm and 107 mm guns, and also 37 mm and 85 mm antiaircraft guns together with antitank artillery to combat enemy tanks. But all these systems proved to be cumbersome and clumsy and little suited for combating tanks. In 1942, we had the mass production of 45 mm and 76 mm antitank guns and antitank rifles set up, and this strengthened our antitank defense. The 76 mm gun became the basic weapon of antitank artillery. In 1943, 57 mm antitank guns began to reach our army. In the same year the artillery received armor-piercing subcaliber projectiles for the 76 mm regimental guns and 122 mm divisional howitzers. In 1944, the delivery to the army of SU-85 assault mounts, armed with an 85 mm gun, and 100 mm antitank guns began in mass quantity. Field and antiaircraft artillery and aircraft with special antitank bombs, the so-called PTAB (ánti-tank aerial bomb - protivotankovaya aviatsionnaya bomba) which were successfully employed to destroy tanks, were brought in to combat tanks. A considerable number of tanks were put out of action

[redacted] 1.3(a)(4)

with antitank mines. However, the basic burden of combating enemy tanks was borne by the antitank artillery, especially 45 mm and 76 mm antitank guns, which destroyed the greatest number of enemy tanks. Moreover, the basic shell was the armor-piercing subcaliber projectile. The shaped charge antitank shell (kumulyativnyy snaryad) showed great effectiveness; however, it was inferior to the armor-piercing shell as far as accuracy and range of a grazing shot. Of course, a large number of German tanks were destroyed by our tanks. During the years of the Second World War the tanks proved to be quite an effective weapon to combat enemy tanks.

It is essential to note that our system of antitank defense proved to be more successful in all respects in comparison with the antitank defense system of the fascist army. The bases of our antitank defense were the tank-destroyer brigades and regiments and also SAU regiments. Possessing great maneuverability, these large units and units were thrown into the axes of the enemy tank attack, quickly assumed firing positions, and fired at enemy tanks. Tank units and large units were also thrown into the axes of the enemy tank attacks, and they combated the tanks in coordination with tank-destroyer units and SAU units. It is quite understandable that in this organizational form these antitank units and large units, including both battalions and separate companies of antitank rifles, appeared to counteract the German tank divisions, against which we quickly concentrated these weapons. In the defense we skillfully created so-called antitank areas that fully justified themselves. The turning back of a great mass of enemy tanks was achieved in this way in the Kursk battle, in the battles near Budapest, and in other sectors.

The German fascist army also had a large number of antitank weapons, including powerful guided mobile

[redacted] 1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted] 1.3(a)(4)

mines, which not only were not inferior in effectiveness to our antitank weapons, but were even superior to them. The 75 mm guns and the assault mounts, armed with 88 mm guns with a high muzzle velocity of the shell, were especially effective. However, the basic mass of antitank weapons of the German Army were in infantry divisions, and it did not have such mobile and powerful large units and units as our tank-destroyer brigades and regiments.

The Germans created a fairly solid antitank defense on the offensive sectors of our troops but on different organizational principles. Their antitank defense was less adaptable for fast maneuvering and concentration of efforts on certain axes, and when they were subjected to our artillery and aircraft strikes they were put out of action faster. To restore the overwhelmed antitank defense the Germans had to bring in new forces and weapons, but often these did not exist. All this greatly simplified our breakthrough of the enemy defense. Of course, in this matter an important role was also played by such factors as the general artillery fire superiority of our army, initiative in operations, and higher military art.

Still, from this indisputable historical fact the important conclusion suggests itself: the success of combat operations is ensured not only by the availability of the necessary weapons of armed combat, but also by their skillful employment.

It is necessary to note that by the end of the war the Germans had succeeded in creating a menacing weapon against tanks — the Panzerfaust, based on the employment of shaped charge antitank shells. It was a mass rocket-firing weapon which was inexpensive to manufacture. Its range of operation was fairly small, and the infantry was armed with it.

[redacted] 1.3(a)(4)

[redacted]

1.3(a)(4)

Any tank armor was burned through by the shaped charge shell of the Panzerfaust. True, it must be said that this weapon made its appearance not because of the easy life the Germans led, but it also appeared, in its way, as a weapon for single combat of man against a tank — that with which we started, the Germans ended with — but it was already unable to exert any noticeable influence on the outcome of the war because by that time the fate of fascist Germany was already decided; however, it indicated the appearance of a new effective close combat anti-tank weapon.

The successful employment of tank troops in the past war, the same as of other arms of troops, to a considerable degree depended on their organizational structure. In this question we were able to achieve a definite success. During the years of the Second World War the organization of the Soviet tank troops corresponded quite closely to the nature of war and the methods of employing tank troops in it, in comparison to the organization of the tank troops of other states. However, we did not arrive at it at once.

At the beginning of the war, in connection with the lack of tanks, we had to reject mechanized and tank corps. By the fall of 1941, the Soviet Army had separate tank brigades, regiments, and battalions which were used to reinforce rifle and cavalry large units. As the saying goes, it was necessary "to cut one's coat according to the cloth."

Already in the initial period of the Second World War, the progress of armed combat indicated the need to have more powerful tank large units to combat enemy tank groupings and to exploit one's success. In 1942, the mass production of tanks was set right, and this made it possible to begin forming tank and mechanized corps and then tank armies. In

1943, we established the organization of the tank troops which remained without any substantial changes until the end of the war.

The special features of this organization were limited to the following. The composition of the Soviet Army had a fairly large number of separate tank brigades, tank and tank assault (tankosamokhodnyy) regiments. They were all used mainly to reinforce the rifle divisions as tanks for direct infantry support. In the defense, they ensured the necessary stability of the combat formations, and on the offensive they played a decisive role in the successful breakthrough of the enemy defense. All the separate tank brigades and regiments were under the orders of the command of the fronts and the Supreme High Command, but in some armies, and even in corps, they had their own organic tank assault regiment. This provided us the opportunity to concentrate the tank troops on the main axes when carrying out offensive operations.

To develop the offensive and to conduct mobile operations in the operational depth, our army had tank and mechanized corps as well as tank armies. They were not assigned to task of breaking through the enemy defense; they were intended for entry into the breakthrough carried out by the rifle divisions together with the NPP (direct infantry support - neposredstvennaya podderzhka pekhoty) tanks, with artillery and aircraft support. This ensured the retention of tanks in these large units and formations to perform the main task of the operation - the rout of the enemy grouping in mobile operations in cooperation with and with the support of aircraft. But in practice, tank and mechanized corps and tank armies did not stop before the creation of a finished breakthrough and, as a rule, were brought in to complete the breakthrough of the defense with its subsequent development.

[redacted]

1.3(a)(4)

[redacted] 1.3(a)(4)

The tank corps had three tank and one motorized rifle brigades in their composition. The mechanized corps included three mechanized and one tank brigades. Initially the tank army included tank and mechanized corps, rifle and sometimes cavalry divisions. But such a tank army did not exist for a long time. Soon only the tank and mechanized corps were left in its composition - a total of two or three corps, or just the opposite, tank and mechanized large units were withdrawn from their composition, and it was replenished with rifle divisions and was transformed into a conventional army.

The German Army had tank and motorized divisions that approximately corresponded to our tank and mechanized corps, although as for the number of tanks, they were inferior to the latter. There were also tank armies in the composition of the German troops, but until the end of the war tank and infantry divisions were included in their composition, i.e., they had a combined composition. Separate tank or assault battalions were added to reinforce the infantry divisions. In the British and American armies, there were armored or tank divisions; they did not have tank armies. Thus, during the period of the Second World War, the Soviet Army had the best organization of the tank troops, and in the Second World War this permitted us to achieve important superiority over the German fascist army also in the methods of employing tank troops in operations.

For the German Army it is characteristic that its tank divisions and armies operated in the first echelon from the beginning and until the end of an operation, and they received independent offensive zones, broke through the defense on an equal footing with the infantry divisions and the field armies, and developed the breakthrough themselves. In this, fundamentally they counted on tanks and aircraft;

[redacted] 1.3(a)(4)

[redacted]

1.3(a)(4)

they did not have powerful artillery for the breakthrough, especially at the beginning of the war. This method of tank troop operations was successful at the beginning of the war when a firm defense and a solid front did not exist and our troops did not have experience and weapons to combat a great mass of tanks. However, in the further progress of the war, the situation changed fundamentally. The breakthrough of the prepared defense became the most difficult stage of the offensive operation. During a breakthrough the tank troops, if they were drawn in for this, suffered their greatest losses in tanks. However, the Germans did not change their tactics of employing tank troops. As before, the breakthrough of the defense was carried out by the tank divisions. That is the way it was during the entire 1942 campaign, then near Kursk and in the area of Lake Balaton near Budapest. It is natural that when breaking through a strong defense that is well saturated with antitank weapons tank divisions lost the basic mass of tanks and successes could not be achieved. Thus, during the war the Germans were unable to overcome their established pattern in the employment of tank troops.

Our tactics for the employment of tank troops differed from those of the Germans to a significant degree. First of all, the great massing of tanks on sectors of the breakthrough should be noted. Up to 80 to 90 percent of all tanks available in a front were usually concentrated on the axis of the main strike, and the density of the tanks reached 85 units per kilometer of the front, including up to 30 tanks and SAU for direct support of infantry. The enemy defense was overwhelmed by artillery and aircraft and was then broken through by the operations of rifle divisions, reinforced by separate tank brigades and tank and assault gun regiments. Mobile troops - tank armies or tank and mechanized corps were led into the created breakthrough, and they completed the breakthrough and

immediately rushed into the operational depth. The mobile troops were usually assigned the tasks of enveloping the basic enemy groupings and encircling and destroying them. In the last stage of the war mobile troops were often employed for a swift advance to a great depth with the goal of splitting the front, of dividing enemy groupings, of destroying them by units, and of capturing important operational lines and areas as swiftly as possible. As a rule, the mobile troops daringly detached themselves at a considerable distance from the remaining forces of the front and conducted decisive mobile operations in the enemy rear. The depth of the mobile troop advance sometimes reached up to 600 km (the Belorussian and the Vistula - Oder operations). The speeds of the tank troop advance fluctuated between 30 and 40 km, but in certain periods they reached 60 km per calendar day. In the operation to rout the Kwantung Army, the 6th Guards Tank Army, despite the difficult conditions of the mountainous terrain, advanced at a rate of about 80 km per calendar day. In those periods when the army did not meet organized enemy resistance, the speed of the advance reached 120 km per calendar day.

Thus, during the Second World War the Soviet Army achieved a very real superiority over the German-fascist army in the art of employing tank troops. As for the American and British army tactics of employing tank troops - they were not at a high level and were not distinguished by great mobility and swift operations.

The great experience acquired by the Soviet Army in the years of the Second World War, in problems of combat employment of tank troops, their technical equipping, and organizational structure, were taken into consideration by us both in the development and improvement of tank troops in the postwar period. However, we could not limit ourselves only to the experience of history in this

[redacted] 1.3(a)(4)

important matter, and we were keen in searching for new paths in the development of tank troops.

II

The future development of Soviet military art must proceed not only and not so much along the path of interpreting lessons of past wars, even though they must be taken into consideration, as along the path of consistent and persistent investigation of fundamentally new methods for conducting combat operations which permit the fullest use of the combat capabilities created by the development of weapons of armed combat.

The development of armored equipment, the organizational structure, and the methods of combat employment of tank troops were decisively influenced in the postwar period by such factors as thegeneral scientific and technical progress in the country, the appearance of powerful nuclear/missile weapons, and the change in the nature and in the methods of conducting war. The swift development of antitank weapons also played an important role and continues to do so.

In comparison with the Second World War, a future war will be conducted with qualitatively new weapons of armed combat. The broad employment of nuclear/missile weapons and modern combat equipment has sharply increased combat capabilities, the strike force, and troop mobility. This led to the review of opinions on the nature of a future war, on the technical equipping and organization of the Armed Forces, and also the basic tenets for conducting combat operations and armed combat on the whole, which were established on the experience of the past war.

In a future war the objectives of armed combat will be not only the armed forces deployed in the theaters of military operations, but mainly the

1.3(a)(4).

[redacted]

IRONBARK

1.3(a)(4)

[redacted] 1.3(a)(4)

deep rear area of the warring sides - the industrial base, supplies of raw materials and foodstuffs, the system of state control, communications, and also strategic weapons of armed combat deployed beyond the limits of the theater of military operations.

Nuclear strikes against important enemy objectives at the front and in the rear and swift operations of forces and weapons on the ground, in the air, and on the sea, with the purpose of employing the results of these strikes for the final enemy defeat is the basis of combat operations of the armed forces. The combat operations of the ground troops will attain greatswiftness, dynamic quality, and mobility. In short periods of time they must be able to carry out a purposeful offensive over the entire depth of the theater of military operations. The decisive role in achieving the high speeds of the offensive will belong to the tank troops, who must possess high combat qualities. It is precisely on the basis of these requirements that we must proceed when determining the paths of future tank troop development.

The improvement of Soviet tanks and their armament in the postwar years mainly proceeded along the line of increasing firepower and effectiveness, mobility, of improving armor protection, of equipping them with a system of antiatomic protection, of providing them with the ability to cross water barriers on the bottom, of increasing their cruising range, and of increasing their service life. As a result of the large amount of work that was performed, new models of Soviet tanks have been built, that are superior to the latest models of tanks of the armies of the largest capitalist countries - the USA, Britain, France, and West Germany - according to several of their tactical-technical and combat quality features [redacted], and they have become part of our armament.

1.3(a)(4)

[redacted]

[redacted]

1.3(a)(4)

During this period the heavy tanks IS-4 (1947), T-10 (1953) and T-10M (1957); medium tanks T-54 (1946), T-54A (1954), T-54B (1956), T-55 (1958), and T-62 (1961); and the light amphibious tank PT-76B (1957) became part of our armament. Work continues on several experimental models.

There is a 122 mm gun installed on the heavy tank which has a shaped charge antitank shell that can penetrate, in practice, any armor of a modern tank (up to 500 mm thick). The medium tank has a 100 mm gun installed for which a shaped charge anti-tank shell has been adopted that possesses great armor-piercing capability (up to 400 mm). The light tank is armed with a 76 mm gun that has a fairly powerful shaped charge antitank shell. By installing an armament stabilizer (stabilizator vooruzheniya) on all tanks, their firing effectiveness when on the move sharply increased. For example, the firing effectiveness of a T-54B tank at speeds of 18 to 22 kph reached 60 percent. The 115 mm smooth bore gun "Molot," installed on the T-62 medium tank, with a 1615 m/sec muzzle velocity of the armor-piercing subcaliber shell, has very high armor penetration. Besides these there are shaped charge antitank shells for this gun with even higher armor penetrating ability.

The tanks have new devices installed for driving and for controlling fire, including night sights (nochnoy pritsel). On the medium tanks the supply of ammunition is increased (from 34 to 43 rounds), the horsepower of the engines has been increased to 580, and the cruising range to 500 km.

All these and other improvements greatly increased the combat characteristics of tanks. Our medium tanks possess especially good combat qualities. They firmly hold the title of the best tanks in the world.

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

The combat qualities of our tanks may be seen when comparing them with the tanks of our probable enemies. For comparison it is adequate to take the basic types of tanks which may include: in the USSR, the medium T-55 tank and the new T-62 tank; in the USA, the M48A2 medium tank and the latest new tank M-60; and in Britain, the MK-IX-X tank. The experimental models of medium tanks that have been built in France and West Germany are not finished and have not become part of their armament yet.

From the given data it can be seen that the T-55 tank with its 100 mm gun is superior to the American M48A2 tank according to several indicators: it weighs less, has better armor protection, more or less equal firepower, and a greater cruising range. However, it is inferior to the American M-60 tank and the British "Centurion" tank in firepower. This is explained by the fact that a 105 mm gun is mounted on their tanks for which there is a subcaliber shell with a muzzle velocity of 1475 m/sec. We do not have such a shell for our 100 mm gun yet. It is necessary to speed up the creation of a subcaliber shell for rifled guns on all types of tanks.

[redacted]

IRONBARK

1.3(a)(4)

[redacted]

1.3(a)(4)

As for the T-62 tank, it is superior to the American M-60 tank according to the basic features, especially in the range of grazing shot and armor penetration. It should be kept in mind, however, that the smoothbore gun has several important shortcomings; in particular, the metal body (sektor) of the subcaliber shell that shatters right after the firing creates the danger of striking our own troops operating in front of the tank. For a certain period this gun may ensure the qualitative superiority of our tanks over the tanks of our probable enemy. But we do not have the right to be content; we must decisively move ahead to a significantly greater distance in the quality of tanks from our probable enemies.

If we compare the T-10M heavy tank with the American M103 (1956) tank, then our tank has slightly better armor protection and a greater speed and cruising range. The British heavy tank "Conqueror" (1954) has more powerful armament, for the 120 mm gun mounted on it has a subcaliber armor-piercing shell with a muzzle velocity of 1550 m/sec.

We made an effort to achieve a qualitative superiority of our heavy tank over the American and British heavy tanks by installing a 130 mm gun on it. Experimental models were prepared. But because of this the tank became too heavy. It became necessary to give up further work on these models. Our T-62 medium tank may successfully wage combat against the heavy tanks of the USA and Britain. Also, the T10M tank possesses combat qualities that are not bad.

Our PT-76B light tank is inferior to the American M41A3 (1956) light tank in armor protection and firepower. But it is almost 10 tons lighter and is amphibious, which is very important for conducting reconnaissance, and has a greater cruising range. As for the other models of light tanks, the experience of the Second World War showed that it was inadvisable to use them, and we stopped building them.

Heavy Tank Comparison Table

	USSR T-10M	USA M103*	Britain "Conqueror"**
Year produced	1958	1956	1954
Combat weight	50	54.4	About 66
Armor protection (in mm):			
Front - turret	250	127-136	200
Front - hull	120	127	200
Side - hull	80	51	90
Armament of tank (caliber of gun in mm)	122	120	120
Muzzle velocity of armor piercing shell (in m/sec)	950	1000	About 1000 (Subcaliber 1500-1550)
Machine gun (number), caliber (mm)	2x14.5	1x12.7 2x7.62	1x7.62
Armor penetration, in mm at 2000 m (armor piercing shell):			
at a 0° angle of impact	200	200	250-100 (subcaliber)
at a 60° angle of impact	65	70	—
Unit of fire:			
rounds for gun (No.)	30	34	35
cartridges for machine gun	744	7825	7500
Maximum speed (kph)	50	34	34
Cruising range (km)	250	130-160	150

* Until 1954 a total of 300 of these tanks were produced in the USA; tanks of this type are not produced any more. Modernization of the ones produced is being done.

** Until 1959, a total of 250 of these tanks were produced. A new 45-ton tank, the "Chieftain", with a 120mm gun and a 710 hp multiple fuel engine is being tested, but the armor of the hull does not exceed 76 mm.

1.3(a)(4)

[redacted] 1.3(a)(4)

On the whole, it may be considered that our tanks possess better combat qualities than the modern tanks of our probable enemy. However, the difference in the combat qualities of the tanks is rather small. Can this situation satisfy us? No, naturally it cannot.

Some comrades consider that the improvements in tanks that were effected in the postwar period are adequate, that they ensured the creation of a completely modern combat vehicle, and that there was no special need to seek other, more radical ways to develop armored equipment. After all, our probable enemies also have not thought up anything special in tank construction.

It seems to us, however, that the question is somewhat different. Above we determined the combat effectiveness of our modern tanks by comparing them with the tanks of our probable enemy. But it is impossible to determine fully the combat effectiveness of tanks in this way. For this, it is necessary to take into consideration other factors as well, first of all the development of antitank defense weapons and also the nature and methods for waging armed combat in ground theaters.

The postwar period has been characterized by the rapid development of antitank weapons, based on the use of shaped charges (kumulyativnyy zaryad). In the first years after the war, recoilless weapons appeared together with the Panzerfaust type of antitank grenades. This weapon was not inferior to tube antitank artillery in armor penetration and even surpassed it. By the end of the 1950s at home and abroad there appeared guided antitank missiles with a tank-destroying range of up to 2 km and more. The shaped charge of the antitank missile is capable of piercing the steel armor of any tank. Moreover, the effectiveness of fire against tanks has sharply increased because the missile is controlled by radio, by wires and by a homing head (golovka). The antitank missiles are small in size and in weight and are mobile, and therefore it is difficult to combat them, but

[redacted] 1.3(a)(4)

[redacted]

1.3(a)(4)

it is completely possible to do so.

During the discussion some comrades concentrated all their attention on the search for shortcomings of the antitank guided missiles. Naturally, antitank missiles, like any new weapons, have shortcomings. They are only beginning to be introduced into the armament of the armies, fire with them may be conducted within the limits of visibility, and technically they are not sufficiently reliable. For example, so far they have only been tested under firing range conditions, where nothing influences the operator and he is not subjected to any danger. In combat it can be different. The operator only needs to lose his presence of mind or even to flinch and then the missile in flight will "flinch"also; it will not hit the tank. This is very important. Moreover, the speed of the missile flight is too low, the dead space (mertvaya voronka) (up to 500 m from the launching mount) is too great, and there is the need to see the tank to be destroyed, something which is not always possible. Visibility is greatly influenced by the relief of the terrain,"on paper itwas flat, and they forgot about the ravines and that one had to walk through them," and it is possible that the missile will meet various types of obstructions before reaching the target causing the missile to explode, etc. All this lowers the combat qualities of the antitank missiles. But the indicated shortcomings will be eliminated, and it would be a serious mistake to underestimate this new type of antitank weapon.

We must consider the fact that modern antitank weapons are light, mobile, and very effective in armor penetration. On the battlefield they will be dispersed, and unavoidably part of them will survive, or new units will be moved out to replace the ones destroyed, even on axes where nuclear weapons are used. Therefore, the underestimation of new antitank weapons is very dangerous, and it may lead to

the fact that in a future war our tank troops may meet such surprises which may decisively reduce their combat capabilities.

It is necessary to recognize frankly that our development of armored equipment in the postwar period proceeded without due consideration for the development of antitank weapons. This is a serious lesson, and we must not ignore it. As a result of this, the antitank missiles and other new antitank weapons with shaped charges took the lead over armor. The old method for tank development has been exhausted, and we must find a new one, a drastic path for its future development. N.S. Khrushchev personally assigned us such a task, and we must accomplish it as soon and as well as possible.

III

What direction should the further tank development take?

At the present time this question is being actively discussed, but opinions on it have differed greatly. Some comrades consider that despite the development of antitank weapons the modern tank is a vehicle completely capable of combat, one that does not require fundamental reconstruction, at least for the near future. Others, on the contrary, say that the modern tank, especially the heavy one, has outlived itself, any mass tank attack may be disrupted, and that the production of a tank is not justified economically. Therefore, it is proposed to return to the light amphibious tank or to create a new armored vehicle with a wheeled running gear of the armored-personnel-carrier-type. The foreign press has carried statements that the tank is a weapon of the past war and that for a future war a vehicle with powerful armored protection is not required.

It seems to us that it is impossible to agree [redacted] 1.3(a)(4)

[redacted]

1.3(a)(4)

with either opinion. Both now and, obviously, in the future we cannot reject the tank. It has several remarkable combat qualities that permit the successful performance of combat tasks under conditions of nuclear/missile warfare. Among all the other combat vehicles the tank withstands a nuclear burst best, mainly the shockwave and penetrating radiation. This is a very important quality under modern conditions. Moreover, the tank has great mobility and fire and strike force. At the present time the missiles of operational-tactical designation have become the main fire weapon of the ground troops. Tube artillery has ceased to be the "god of war." If the tank is removed from the armament, then the fire and strike force of ground troops will be sharply reduced. One cannot conceive this matter in such a way that all the tasks of fire destruction of the enemy in a future war will be performed only by missile troops of operational-tactical designation using nuclear weapons; many tasks will still have to be performed by conventional fire weapons. Tanks are the best weapons for this. When necessary they can be concentrated on definite sectors due to their high mobility, and this ensures the necessary fire density. Therefore, a tank-type combat vehicle must remain in the armament of our army.

At the same time, the modern tank has become vulnerable to new antitank weapons; is poorly protected from shaped charges; and has insufficient antiatomic protection. Therefore, we cannot remain at the level achieved under any circumstances.

Recent research showed that there are potentialities to increase considerably the shaped charge protection of tanks. This problem is resolved by installing special shielding (ekranirovaniye) devices, the employment of combined (kombinirovanaya) armor, and the use of appropriate forms of armor protection.

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted]

IRONBARK

1.3(a)(4)

1.3(a)(4)

[redacted]

This may greatly increase the viability of tanks on the battlefield. Moreover, it will not require an increase of armor protection and consequently an increase in the tank's weight.

Increasing the tank's antiatomic protection will have important significance. It is achieved by installing special "linings" (podboy) that reduce the flow of neutrons, and also an automatic system for hermetically sealing the tank, by removing radioactive dust from the air, by creating pressurization, etc.. This ensures the protection of the tank's crew from destruction by a medium yield (30 kt) nuclear burst at a distance of 400 to 600 m from ground zero.

Recently, increased combat characteristics of the 100 mm gun have been achieved. The muzzle velocity of an armor-piercing shell of this gun has been brought up to 1015 m/sec, the same armor penetration as achieved by the British 105 mm gun. The firing range of the new 100 mm gun with a high-explosive shell reaches 15 kilometers.

The presence of a large number of tanks with guns having powerful charges and a considerable range of fire in tank and motorized rifle large units permits their use for fire from concealed positions with the goal of performing various tasks and first of all of destroying the missile mounts, atomic weapons, and other enemy objectives both in open and in concealed positions.

The acceptance into armament and the assimilation of the T-62 medium tank with the new smooth bore gun will undoubtedly increase the combat capabilities of the tank troops. This tank may successfully combat any enemy tank, using subcaliber and high-explosive antitank shells. Therefore, it is advisable to have a definite number of tanks with a smooth bore gun.

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted]

IRONBARK

1.3(a)(4)

[redacted]

1.3(a)(4)

At the present time our designers are developing a new model of a medium tank weighing 34 tons which will have a 115 mm smooth bore gun with full mechanization of loading, and this will permit reducing the crew by one man. Subsequently, the tank will also have a rifled gun installed on it with mechanized loading. This tank will have a complete antiatomic, antichemical, md antibacteriological protection and also will have armor that ensures protection from high-explosive antitank weapons of destruction. The tank running gear will ensure an average speed over terrain (not over roads) of about 45 kph and a maximum speed over roads of about 75 kph.

A noticeable increase in the combat capabilities of tank troops may be achieved by accepting into our armament a medium tank with guided missile armament (range of fire 3 to 4 km), on the creation of which work is proceeding at the present time. This tank should destroy any enemy tank when on the move with one or two rounds.

After the new medium tanks with guided missile equipment are accepted into our armament and are assimilated, it will be possible to raise the question of replacing the T-10M heavy tank because the new medium tanks will have higher combat characteristics. However, it is necessary for us to take into consideration that our probable enemies, especially Britain, continue work on building heavy tanks with increased qualities in comparison with the existing ones.

We should concern ourselves with the problem of building a combat vehicle - a tank destroyer - with guided missile armament of the assault-gun type.

At the present time work is being done to build a half-tracked (or wheeled) combat vehicle with

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted] 1.3(a)(4)

missile and small arms armament for the infantry. Such a combat-armored vehicle must have antiatomic protection and high mobility on the terrain, equal to the mobility of a tank.

This "combat vehicle", let us call it that, must have very strong armor protection, have high road qualities, and it must have a low silhouette (prizemistyy) so that it would be easy to camouflage it and would be less vulnerable to antitank guided missiles (PTURS). As for its capacity, it must carry a squad of riflemen (approximately 10 to 12 persons, including the driver and commanding officer. It must be capable of waging combat, i.e., of destroying the enemy with its own weapons, and when necessary the riflemen can leave it and in coordination with it, as well as with their own combat weapon, perform the tasks of an infantry battle. It must replace the armored personnel carrier and provide our tanks with an infantry assault group which it is now completely impossible to transport on the body of the tank.

Together with all this, we must speed up work directed toward the sensible reduction of a tank's weight, the increasing of its mobility, especially the increase of its speed and cruising range, the reduction of the crew while ensuring mutual replacement - the entire crew must know how to drive the tank, etc..

Special attention must be devoted to work on the use of plastics in tank building. Initial results received in this problem testify that plastics (plexiglass) (stekloplastika) may find broad use in building modern reliable tank-type armored vehicles.

The realization of all these primary measures will undoubtedly increase the combat capabilities of our tanks; will make them more reliable against

[redacted] 1.3(a)(4)

[redacted]

1.3(a)(4)

modern antitank weapons and nuclear bursts; and this will permit the employment of our tank troops with greater success in a future war.

We have expressed some thoughts on the building of new tanks and combat vehicles in the near future. But this by no means reduces the significance of the tanks which we have in our armament. They are quite suitable for combat use and can perform combat tasks successfully. We are firmly convinced that certain statements which appeared in the press and which express doubt about the usefulness of the tank for modern warfare are wrong. The tank continues to be a powerful weapon of modern combat and, by developing, will remain so in the future. However, it is necessary to take into consideration new conditions for employing tanks on the battlefield, in particular the possession of very effective antitank weapons by the enemy. For this it is necessary to take measures in all cases for the decisive neutralization and destruction of these weapons of the enemy, in order to decrease as much as possible the effectiveness of their operation against tanks on the battlefield.

Above we spoke of the immediate task of improving tank equipment. But this is not enough. We must also look into the more distant future. No weapon can be developed successfully if at the proper time a prospective forward movement is not determined. In relation to tanks, this problem has become especially urgent at the present time.

It is quite apparent that despite the presence and development of nuclear/missile weapons mass ground troops will participate in future wars for a long time yet. To wage successful armed combat the ground troops will have to have combat vehicles which, as far as possible, must be able to resist nuclear bursts and protect personnel from light

radiation and penetrating radiation and also from destruction by conventional weapons i.e., these vehicles must be reliably armored. Moreover, we must have at least two types of combat vehicles: the first type is a vehicle with light armament to conduct an infantry battle ("combat vehicle"-((boyevaya mashina)); the second type should have heavier armament so that it could wage combat against any combat vehicles on the battlefield and achieve success.

The second type of vehicles of the future will apparently appear as a continuation of modern tank development. It is mainly intended for the swift exploitation of the results of using nuclear/missile weapons, for the final defeat of enemy ground troop groupings, and for the seizure of important areas and objectives. For this the tank of the future must be capable of waging successful combat against tanks and lighter enemy "combat vehicles" and of destroying his personnel and the fire weapons of the ground troops, including nuclear and antitank weapons.

It should be taken into consideration that in a future war the enemy may employ a large mass of tanks. They must be opposed by our tanks with such armament which would ensure the reliable destruction of enemy tanks. But in actuality, the combat capabilities of tube artillery are almost all exhausted. In the near future it will apparently be replaced by modern guided and homing missiles with powerful new charges.

However, antitank missiles may not be the only armament of the tank of the future. Antitank missiles are close combat weapons, which are intended mainly for combat against tanks. The tank of the future apparently must have weapons with the aid of which it would be possible to wage combat against enemy tactical nuclear weapons and neutralize the

[redacted] 1.3(a)(4)

conventional fire weapons of the ground troops, first of all, naturally, antitank weapons over a fairly large area.

Tank troop operations will be supported by missile troops of operational-tactical designation. But in several instances this support may not be effective enough, especially when conducting mobile operations in the operational depth. At the present time the missile troops of operational-tactical designation are considerably inferior to the tank troops in mobility. We must decisively increase their mobility. If the battle formations of tank troops contain protected mobile combat vehicles of the tank type but which are capable of delivering nuclear strikes against the enemy, then the combat capabilities of the tank troops will grow immeasurably. We must work on building such a missile combat vehicle, and it should be built.

There are many other problems of a purely technical nature that require resolution: modern tank armament is becoming obsolete, and we must search for a new type of armor - lighter, economically more advantageous, and at the same time very stable and strong; we must improve the running gear of the tank so that it can ensure movement over the terrain at high speeds and great distances; we need a more powerful and more economical engine, etc. Right now we must work on the resolution of these problems.

IV

A discussion is also proceeding on the problems of the role of tank troops in a future war and especially on the organization of these troops. The most varied opinions have also been expressed on these problems. It is impossible to agree with some of these opinions because this would not move us forward but would push us back and would inflict

damage on the combat effectiveness of our ground troops.

First of all, let us discuss the role of tank troops in a future war. There is no doubt that an important role in a future war will belong to the tank troops. This arm of troops may use the results of massed nuclear/missile strikes for their swift movement into the depth and the defeat of the opposing enemy groupings more quickly and more effectively than the motorized rifle or other troops which are organized on unified principles. Together with this it would be incorrect to count on the fact that only the tank troops in their present existing organization would perform all the tasks on the battlefield, as some comrades maintain. Tank troops cannot operate successfully in a modern operation without missile troops of various designations and without close coordination with aircraft and motorized rifle troops in the main theaters of war. The successful conduct of combat operations in a future war will depend on joint, clearly coordinated operations of all arms of troops, first of all of the missile, tank, motorized rifle, and airborne troops. The tank troops played an outstanding role in the defeat of the German fascist troops in the past war, and we must not forget this. Now they must be prepared for operations under the complex conditions of nuclear/missile warfare and for the display of exceptional reliability and endurance.

On the problems of tank troop organization opinions are divided. Some comrades favor the liquidation of the tank army and the transition to a single army organization. There is also an opinion about a transition to a single division organization, the transition to the so-called unified division. These are very serious problems and cannot be simply and easily resolved. The further

[redacted] 1.3(a)(4)

[redacted]

1.3(a)(4)

structure of the ground troops and the methods for their combat employment in the future will greatly depend on their correct resolution. Therefore, let us examine them in greater detail and more deeply.

Soon after the Second World War, and taking into consideration its experience, three basic types of divisions were created in the composition of the ground troops: rifle, mechanized, and tank; and the tank army was reorganized into a mechanized army. The rifle division, which included the tank assault regiment (tankosamokhodnyy polk), was intended for breaking through a prepared defense, and the mechanized division was intended for completing and developing the breakthrough. The mechanized army, the composition of which included tank and mechanized divisions, was intended for commitment into the breakthrough and for conducting mobile combat operations in the operational depth. This organization of the ground troops conformed to the methods for conducting armed combat in the ground theaters which were employed in the last war, and it was based on the experience of this war.

This we should not forget even now, because everything new arises from the experience of the past.

The development of the weapons of armed combat introduced changes in the methods of conducting military operations, and this in turn, naturally, required the introduction of corrections in the organization of troops. Nuclear weapons, which were received into the armament at the beginning of the 1950s brought about the most serious and fundamental changes in the methods of conducting military operations. Their further development and the appearance of missiles as a means of delivering nuclear weapons to the target and the mass employment of this weapon completely changed the method of

[redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

breaking through the prepared enemy defense. Military operations acquired a swift and more mobile and dynamic nature, and broad possibilities for the employment of tank troops in the first echelon from the very beginning of the operation were discovered. By this time the complete motorization of the ground forces was achieved.

In connection with this, the decision was made to have one motorized rifle division, instead of rifle and mechanized divisions, and for it to have motorized rifle and tank units in its composition. The motorized rifle division is capable of successfully performing the tasks of breaking through the enemy defense, developing the breakthrough, and conducting mobile operations in the depth. Also, for operations on the main axes it was necessary to have a division with a more powerful strike force and at the same time a lighter one, a tank division, which could develop the offensive at high speeds to a greater depth and which would possess the best capabilities for waging combat against enemy tank troops.

The motorized rifle division was the basic large unit of the combined-arms army, which possesses almost the same combat characteristics, if not greater ones, as the mechanized army. Thus, naturally, the need for a mechanized army ceased. However, it immediately became necessary to have a large unit which would possess swifter, powerful breakthrough force and greater mobility than the combined-arms army. The tank army proved to be the best organization of this type. Its composition normally includes three tank and one heavy tank divisions, but its organization is not a set form, and its composition may be changed depending on the situation. The tank army is intended for performing the most important tasks in operations, which must be performed reliably in the fastest possible way.

[redacted] 1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted]

IRONBARK

1.3(a)(4)

[redacted] 1.3(a)(4)

Lately, several significant corrections and additions have been introduced into the organization of divisions and armies. The number of personnel in divisions has been sharply reduced, and the number of rear services units and establishments in divisions and armies has been reduced, and this has lightened them and has increased their mobility. In this respect, however, everything has not yet been done.

We must find ways to lighten the divisions further. First of all, we must find new means to provide the divisions with everything necessary to wage combat and also new methods to deliver and transport everything necessary for daily living and combat. The fast development of industry, the appearance of new branches of production, and new discoveries create the necessary conditions for the decisive lightening of the organs and means of supplying and feeding.

Missile subunits, armed with tactical missiles with nuclear charges, and antitank missile subunits are included in the composition of the motorized rifle and tank divisions. Missile large units, armed with operational-tactical missiles with nuclear charges, are included in the composition of the combined-arms and tank army. All this greatly increases the combat capabilities of our divisions and armies and gives them remarkable new combat qualities.

We consider that the existing organization of the ground troops meets modern requirements and that it corresponds to the nature and methods of conducting combat operations in the ground theaters in the initial period of a future nuclear/missile war. In the near future a fundamental change in the organization of the ground troops will not be necessary.

[redacted] 1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted]

IRONBARK

1.3(a)(4)

[redacted]

1.3(a)(4)

If we compare the organization of our ground troops with the organization of the ground troops of our probable enemy, it is not hard to come to the conclusion that we have achieved better results in this matter. Our tank division and the armored division of the USA have approximately the same number of tanks, but the American division has two to three times more personnel and motor vehicles than ours. To this should be added the better quality of Soviet tanks and the presence in our tank division of heavy tanks which the American division does not have. It is true that the American armored division does have more infantry and artillery, but this makes it more cumbersome and less mobile. It may be considered that in strike force and mobility the Soviet tank division is definitely superior to the American armored division and also to the tank divisions of the other NATO member countries.

Our motorized rifle division has 1.5 to 2 times less personnel and motor vehicle transport than the corresponding divisions of the NATO member countries. In number of tanks, it surpasses the American infantry division but is slightly inferior to the British and West German divisions. The American division has more artillery while in our division there are more guided antitank missiles. Thus, our motorized rifle division is more mobile and is less vulnerable to nuclear weapons in comparison with the divisions of our probable enemy, and is not inferior to them in strike force and firepower.

We also achieved the best results in the organization of the army, and this is especially important. The armies of the NATO countries include army corps and a large number of divisions and have a complex system of control and cumbersome rear services. Our combined-arms armies, which are

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

intended for operations in the Western Theater, do not have a corps control element and have much less personnel and rear services units and installations, even though their firepower and strike force are only slightly inferior to the armies of our probable enemy. The fact that there is a tank army in the composition of the Soviet Ground Troops and none in the NATO army ensures a great advantage for us in conducting combat operations under conditions of nuclear weapon employment.

Thus, it can be considered that the existing organization of our ground troops stands at a higher level than the organization of the troops of our probable enemy and that it corresponds more closely to the nature and methods of conducting combat operations in a future war. Naturally, this does not mean that we must be content and rest on our laurels. During the discussion various proposals were submitted on particular problems of improving the organization of the tank troops; some comrades proposed having single type tank regiments in the tank division, i.e., remove the heavy tank regiments from its composition; other comrades proposed transferring the motorized rifle regiment of the tank division, by battalions, into the composition of the tank regiments of this division; and proposals were also made for liquidating the battalion echelon of control in the tank divisions. All these proposals deserve attention, and they should be thoroughly analyzed and studied, and all that is best which strenthens our combat effectiveness should be used. Such a problem as whether it is better to remove the heavy divisions from the composition of the tank army and to have them in the reserve of fronts or of the Supreme High Command, and to have a single type of division in the tank army should be weighed from all standpoints.

We must work continually on improving troop

organizational structure. But in this matter great caution and discretion must be exercised. Frequent changes in troop organization do not always promote increased combat readiness, more likely, just the opposite; it weakens them because any change in troop organization is painfully experienced by the combat organism.

Can one consider that the need has arisen to create unified divisions of ground troops, divisions with a single organization? It seems to us that there is no such need at the present time.

In a future war, our ground troops will probably have to operate in the most diverse theaters of military operations -- plains, mountains, forests, deserts, and in the Arctic. This fact itself already shows that there cannot be a single troop organization for all these theaters. It is also impossible to create one type of division for the basic theater, the Western Theater. This would result in dispersing of the basic decisive combat weapons such as tanks, missile weapons, etc., and it would complicate their massing on the main axes. The economic potentialities of the state should also be taken into consideration. It would be unrealistic, inadvisable, and completely wrong to provide all the divisions with the necessary amount of tanks and other combat weapons of a decisive nature.

During the discussion, the proposal to organize a third type of division was advanced - a light motorized rifle division without tanks so that it could be used for swift transfer by air. But we have such a division - the airborne landing division. We must work on the improvement of this division, and we must find new reliable and more effective weapons and means for its armament, transport, and landing. Apparently it is time to include the new SU-85 assault guns for armament in the composition of the airborne landing division. The existing

motorized rifle division can also be transferred easily by air transport it is true, because it has no tanks so far. Therefore, there is no need to create a light division.

Perhaps one hears the greatest number of arguments on the tank army. Some comrades propose that we abandon the tank army and have one type of army. The main argument that is advanced is usually that now there is no special difference in mobility and maneuverability between the combined-arms and tank armies and that the tank army will be unable to break away from the combined-arms army during the offensive operation. But this argument is not completely convincing. The tank army still has relatively more tanks than the combined-arms army, if we proceed from the same number of large units. But this is not the main thing. It has fewer divisions and they are all of one type, it is not as burdened with rear services and is more controllable. Consequently, in strike penetrating force, swiftness, mobility and stability from nuclear strikes, it has definite advantages over the combined-arms army, and it is impossible to disregard this. These qualities must be developed and used as fully as possible.

When resolving the problem of the tank army it is necessary to proceed, first of all, from the point of which method will be used to conduct future offensive operations. Apparently, first of all, the enemy troop grouping deployed in the theater will be subjected to massed nuclear/missile strikes. During this the front and army nuclear/missile weapons will deliver a strike over the entire depth of the enemy operational troop formation. The missile troops of strategic designation will deliver an incomparably more powerful strike against the strategic objectives in the depth of the theater. Undoubtedly this strike will also affect the groupings of the

[redacted] 1.3(a)(4)

[redacted]

IRONBARK

1.3(a)(4)

[redacted] 1.3(a)(4)

armed forces, especially reserves, airfields, rear services of groups of armies, the system of control, etc. We do not have a completely clear concept of what will happen as a result of such a strike. Some say that complete devastation will result and will be difficult to overcome; others say that there will not be such devastation and that considerable life and resistance will remain. Apparently both have to be taken into consideration, but mainly we must consider the huge destruction which nuclear/missile weapons are capable of inflicting and also all the consequences that arise from them. Right after the nuclear strikes the ground troop groupings will move to the offensive. These groupings will have to perform at least two basic tasks: the first, the main task, will be to advance swiftly to a great depth, into the area and beyond the area subjected to missile strikes by strategic designation troops in order to disrupt the mobilization, capture key areas and objectives, and to inflict destruction without allowing the enemy that survived to come to his senses; the second task will be to complete the total rout of those enemy forces that survive the nuclear strikes in the front offensive zones, with the same decisive movements into the depth of the enemy's country.

Today the best means for performing the first task are the tank armies in close coordination with airborne troops; this will be the basic strike force in performing this task.

The tank army may, with greater success than the combined-arms army, overcome areas subjected to nuclear strikes, rout the contacted enemy groupings, which are also very well supplied with tanks, in meeting engagements, and swiftly move to the deepest objectives for the final performance of the tasks of armed combat on the given axis. Our tank

[redacted] 1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted]

IRONBARK

1.3(a)(4)

1.3(a)(4)

[redacted]

armies should prepare first of all for this very type of operation.

The combined-arms armies are also capable of delivering deep and swift strikes. Some of them will be directed toward achieving the final goal of the operation in coordination with the tank armies or independently. It should still be kept in mind that the combined-arms army may suffer great losses from enemy nuclear strikes and that it is larger numerically and consequently a little less mobile. All these are insignificant minuses and in no case should they 'dishearten and hold back our combined-arms armies which should not only strive not to lag behind the tank armies in the speed of the offensive, but should show even higher speeds and capabilities.".

It should also be taken into consideration that large enemy groupings will remain in the operational depth. They will be neutralized by nuclear strikes and broken up, but they will still be sufficiently suitable for combat so that they can cause our fronts serious trouble. It is essential to rout, destroy, or capture them, i.e., to perform the second task that was mentioned above. This is also an important task. Without having performed it, it is impossible to count on the successful conclusion of the operation. It is advisable to use the combined-arms armies to rout these enemy groupings,in this way freeing the tank armies for deep strikes.

Consequently, we come to the conclusion that to abandon the tank army at the present time would be completely incorrect. In history there already was an instance when without adequate basis large tank large units (mechanized corps) were eliminated. Reality made it necessary to form them again, but this cost us a lot and time was lost. We should

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

[redacted] 1.3(a)(4)

not forget this lesson of history.

Tank divisions and tank armies possess high combat characteristics such as mobility, great strike force, and relative stability against nuclear strikes. They are better able than other divisions and armies to utilize the results of nuclear/missile strikes for the swift advance to a great depth and for performing tasks of armed combat with a speed of advance up to 100 km per calendar day or more, given the appropriate organization, support, and momentum. Despite the development of combat weapons against tanks and the changes of conditions and methods of employing tank troops, they will undoubtedly play an important role in the performance of the tasks of a future war, if we are not able to avoid it.

That is how we see the most important tasks of the future development of the tank troops, their armament, organizational structure, and methods of combat employment. The main task consists of broadly developing work on the creation of new types of combat vehicles and new types of armored equipment with powerful missile armament. Until this task is performed, we cannot lessen our efforts even for a minute to improve the existing tank equipment and to improve its qualities and viability. In the development of all types of armament it is essential to adhere closely to the rule: until a new weapon is created, the existing models must be improved. Only under this condition will the constant combat readiness of our armed forces be ensured.

In the area of improving the organizational structure of the tank troops we should proceed in the direction of increasing the firepower and strike force of the large units and formations and their mobility and independence in performing

[redacted] 1.3(a)(4)

[redacted]

1.3(a)(4)

combat tasks. At the same time, we must approach changes in the organizational structure of the tank troops with foresight, but very thoughtfully in order to avoid mistakes.

The questions of tank troop development which we have touched upon in this article undoubtedly require further thorough study and practical testing during the everyday activities of our Armed Forces.

We should like to stress once again that to a very great degree the success of tank troop operations depends on the level of the operational training of tank commanding officers and on their courage and decisiveness. The courageous and brave tank commanding officer, leading a tank army, a tank division, or a tank regiment into combat, achieves success in combat, in an operation, and achieves victory over the enemy. The indecisive tank commanding officer who is weak hearted is the likeness of death. Their place is not in the tank troops. We proudly praise such outstanding tank commanding officers as Marshal.. of the Tank Troops P.S. Rybalko and S.I. Bogdanov, Generals T.I. Tanaschishin, P.V. Volokh, V.I. Polozkov, and many others who gave their life for our great cause. We also praise our outstanding tank chiefs, who are still alive today, for their renowned combat deeds in our great victory. We must cherish and preserve these glorious combat traditions of our valiant heroic tank troops and learn from their traditions - act courageously, bravely, and daringly in combat and in an operation. Figuratively speaking, if the combined-arms armies are a decisive swift battering-ram, then the tank armies are arrows released from a tightly drawn bowstring; they fly swiftly to the designated target. Such must be the operations of our tank armies.

MEMORANDUM FOR: Deputy Director (Plans)

SUBJECT: Negotiations with SIS
Concerning Letter to KGB/GRU

1. Mr. Angleton, Chief, CI Staff, and I have been negotiating for the past two weeks with Maurice Oldfield and through him with SIS Headquarters in London relative to possible action to be taken in conveying to the KGB/GRU the possibility of public revelation of certain of the information provided us by [redacted] as an inducement for more considerate treatment of [redacted] and the release of the British businessman WYNNE. 1.3(a)(4)

2. As you know, you approved originally an anonymous letter to the KGB/GRU written to this effect with the stipulation that it be passed covertly through British channels to the KGB and GRU. SIS objected unequivocally to this scheme and we informed them that we were disappointed with their position in this matter.

3. Quite recently in communications from SIS Headquarters in London through Maurice Oldfield, we were informed that they had indeed reversed their position and proposed discussions with the Foreign Office which, in the opinion of Mr. Angleton and me, went much too far and proposed a detailed expose of several categories of substantive information that [redacted] had provided during his tenure as a joint agent of SIS/CIA. Further, they proposed to make an official approach through local representatives of the KGB and GRU acting on behalf of SIS and CIA. Mr. Angleton and I objected vigorously to this proposal, pointing out that this Agency could not, under any circumstance, condone the establishment of an official contact with any intelligence organ of the Soviet Union. Further, we pointed out that the revelation to the Soviets of large areas of [redacted] substantive reporting would be counterproductive in that it would provide the Soviets with solid grounds on which to initiate a propaganda attack on both the U. S. and the U. K. 1.3(a)(4) 1.3(a)(4)

4. In subsequent negotiations and after preliminary discussions with the British Foreign Office, SIS proposed

[redacted]

APPROVED FOR RELEASE

31 MAR 1992

[redacted]

that it take official unilateral action including the consideration of the possibility of a mass "PNGing" of Soviet intelligence personnel in the U. K. We objected to this on the following grounds:

a. SIS cannot in realistic terms make any official approach to either the KGB or GRU unilaterally in light of the fact that the Soviet authorities have learned from [redacted] that this was a joint operation. 1.3(a)(4)

b. We cannot consider any proposal leading to the mass "PNGing" of Soviet officials because of the obvious and certain retaliatory steps which will be taken by Soviet authorities.

c. We cannot consider any official contact or approach to the KGB or GRU in London. We are willing to consider the use of written communications couched in general terms which will allude to the possibility of revelation of facts known to us from [redacted] concerning the use of official and unofficial representatives of the KGB or GRU abroad; or we are willing to consider the use of a cleared British attorney ostensibly acting on behalf of Mrs. WYNNE to communicate similar information. 1.3(a)(4)

d. We are of the opinion that we should include a request alluding to the safeguarding of [redacted] in addition to the release of WYNNE with the full knowledge that the threat insofar as it pertains to [redacted] will be little more than psychological but may serve to disrupt further relations between the KGB and the GRU. 1.3(a)(4)

5. We have reached the point in our negotiations with SIS, as represented by Maurice Oldfield, where establishment of an official Agency position is required and we are recommending that you approve the above. In this context, you may wish to inform the Director of these negotiations in the event that the matter is raised with him by Sir Dick White, Director of SIS.

Memo for Rec'd FW 9

3 May 1963

MEMORANDUM FOR: Director of Central Intelligence

SUBJECT: Possible Developments in the Trials of Oleg Penkovskiy and Greville Wynne

1. This memorandum defines the probable upper and lower limits to Soviet propaganda exploitation of the trial, now reported to begin 7 May in Moscow, and in the attached annex outlines tentative Clandestine Services planning for counter-action.

2. Minimum and maximum variants in Soviet propaganda exploitation:

a. Minimum exploitation: If the Soviet government so decides, it can try Wynne and Penkovskiy separately, the latter in a closed trial with no publicity except for an announcement of the verdict and sentence. The Soviets committed themselves, however, to an open trial for Wynne when they chose to cover his kidnapping from Hungary as an extradition action. (Recent press reports have specifically announced that the Wynne trial will be open.) In this minimum publicity variant, Penkovskiy would probably not appear as a witness in Wynne's trial and anti-U. S. and U. K. propaganda would be limited. The U. S. officials already named by the Soviet press but still in Moscow (Montgomery, Davison and German) might not be declared persons non gratæ.

b. Maximum propaganda exploitation: At the other extreme, a full show trial could be staged to provide maximum publicity to the exposure of American and British espionage activity against the USSR. Here, Penkovskiy would probably appear as a witness in open court and might even be tried before the same court or at a concomitant trial. In such a case, we expect that besides the U. S. officials already named in the pre-trial publicity, British involvement would be spelled out in appropriate detail; Penkovskiy's case officers would be identified (two of them, Joseph J. Bulik and Rodney M. Carlson, have served in the USSR [redacted] 1.3(a)(4)
and Bulik has since travelled there [redacted]; and other evidence in Soviet hands could be surfaced. (For example, the full text of the letter we wrote Penkovskiy in July 1962, of which a small part was printed in the Soviet press in November 1962, contains accommodation addresses and telephone numbers in the U. S. and in the U. K.) PNG action against all implicated American

APPROVED FOR RELEASE
31 MAR 1992

[redacted]

[redacted]

and British officials still in Moscow would almost certainly follow such a trial. It should be noted, however, that beyond providing extensive documentation to the charge that a high-ranking Soviet official committed espionage in behalf of U. S. and British intelligence, there is little that could be exposed in the trial. Without extensive fabrication, allegations of sabotage, assassination, covert political action, etc., would be extremely difficult to substantiate convincingly.

3. Review of Probabilities: Available evidence is insufficient to predict which course of action the Soviets will choose although recent Moscow reports tend to indicate that the stage is being set for an open, maximum publicity trial. (The hall reportedly reserved for the trial of Wynne has a seating capacity of 300 and it has been announced that the trial will be open.) There is some reason to think that there have been one or more changes of plan or at least of timing since the case was discovered by Soviet authorities. The initial burst of publicity in November and December 1962 was abruptly cut off; the long delay in bring Wynne to trial cannot be explained by the need to complete the pre-trial investigation (from the counterespionage point of view, much of the investigation had to be done before the trap was sprung on Richard Jacob on 2 November 1962); pre-trial publicity and buildup (surfacing of the Popov and Olga Raus cases, etc.) has been sporadic and diffuse, something very uncharacteristic for the usually well-oiled Soviet propaganda machine. One possible explanation is that the Soviets have had second thoughts about the possible adverse effects that the publicity of the Penkovskiy case might have on the Soviet military establishment in connection with the recent important personnel changes in the military hierarchy (the dismissal and apparent arrest of General Serov, the replacement of Marshal Zakharov, etc.)

4. Evaluation of propaganda impact of Trial: Whatever course of action the Soviets choose, it appears that the Wynne and Penkovskiy trials will present more problems to the Soviets than to us. As far as U. S. involvement is concerned, the Soviets have already fired their biggest guns in the publicity following the detention of Richard Jacob; they can use the trial to document their charges, but they cannot add anything substantially new by way of exposure. The British situation is rather different in this respect. Besides Wynne himself, thus far there have only been vague allusions to the

[redacted]

[redacted]

role played by British officials in the case. Wynne is in a position to implicate three or four MI-6 officers by true name and the revelation that the pregnant wife of a British Embassy officer was used for clandestine street meetings with an espionage agent may well have a strong effect on a British press still smarting from the treatment it received from the Radcliffe Tribunal.

5. Impact of the Trial in the Soviet Union: From the Soviet point of view, the problems presented by the Penkovskiy affair are much more serious and far-reaching. For one thing, in terms of damage to Soviet national security, the case is unprecedented in classical espionage history. It will be tremendously damaging to those who are held responsible and since Penkovskiy's circle of friends, patrons, and unwitting accomplices was large and highly placed, the struggle to escape or affix responsibility could assume considerable proportions. Although it is true that this struggle would take place in any event, a public airing of the Penkovskiy affair, no matter how carefully the facts are manipulated, is bound to feed oxygen to flames that are already reaching dangerously high.

[redacted]

PLANS FOR COUNTER-PROPAGANDA IN PENKOVSKIY CASE

The following plans have been reviewed within the Clandestine Services and by a representative of MI-6. Although it is recognized that policy considerations and developments during the trial may rule out the actual use of any or all of the materials now being prepared, preparation is underway to ensure that if it is desired to implement the plans, the material will be at hand to do so.

1. General strategy: The purpose of our counter-propaganda will be to emphasize the following points:

a. Penkovskiy was a career Soviet Army officer who served with great distinction in the Soviet armed forces during WWII and was decorated for valor, and who apparently sees himself in the role of a twentieth century "Decembrist"--a Russian soldier and patriot working toward the establishment of a just and liberal government in his native land. He represents the exasperation and legitimate anger of the Soviet military establishment against the interference of the Communist Party and the Soviet security police, which has galled the military since 1918.

b. This trial should be viewed in the context of Soviet internal politics as they have developed since the Cuban crisis in the fall of 1962. The failure of Soviet policy, both domestic and foreign, in recent months has greatly heightened the tensions among the Soviet leaders. Penkovskiy is a pawn in a deadly game of intrigue now being played among various factions in the Soviet leadership. Although only the trial can reveal the exact intent of the manipulators, it seems likely that the career officers of the armed forces and the military intelligence service are the most likely targets. It could be the curtain raiser in a campaign to destroy the present Soviet military leadership the way Stalin destroyed Tukhachevskiy and his cohorts in the late '30s.

c. Although it should be handled as a matter not directly relevant to the Penkovskiy case, the threat to the free world of Soviet intelligence operations and Soviet military intentions should also be emphasized.

2. Guidelines and Restrictions for Publicity: These plans have been drawn up with the following guidelines and restrictions:

[redacted]

[redacted]

a. No materials supplied to the press or used in the campaign will confirm the Soviet allegation that Penkovskiy was an agent of American and British Intelligence.

b. No information will be supplied that will tend to confirm Soviet allegations concerning intelligence activities on the part of U. S. officials or the citizens of Western countries whose names may be mentioned in relation to the case.

c. Information concerning Penkovskiy available to us will be used extensively within these limitations, ascribing its sources to persons in Turkey and unnamed persons in the West who have met Penkovskiy or are familiar with his activities, including an "unnamed former Soviet official who has defected to the West."

d. Certain documents pertinent to the general subject of Soviet espionage in the West will be released for surfacing provided it can be done without risk of direct attribution to Penkovskiy.

3. Specific Plans:

a. For Publication at the Beginning of the Trial: An article will be placed in Turkey which will cover Penkovskiy's biography as extensively as the ostensible sources will permit. A photograph of Penkovskiy in uniform with decorations will be printed with the article. The main subjects to be stressed will be Penkovskiy as a professional military officer, decorated for valor during WWII and dedicated to the best interests of his service and his country. His affiliation with the GRU will be spelled out.

b. Followup on Initial Article: The initial article will be replayed in major western media to the greatest extent possible. Articles of commentary and opinion in which the basic facts may be somewhat broadened, citing unnamed acquaintances of Penkovskiy's or an unnamed Soviet defector, will amplify the political aspects of the Penkovskiy trial, relating it to the internal political situation in the Soviet Union, the position of the Soviet Armed Forces in relation to the leadership of the Communist Party and the security police, etc. Penkovskiy will be cast in the role of a patriot struggling against tyranny, but not as a spy.

[redacted]

c. Defensive Briefings: Some western contacts of Penkovskiy's even though the involvement was to no degree compromising, who might be cited in the trial, will be briefed as to what they might say about their relations with him in the event that they receive publicity and are asked by the press for comment.

d. U. S. Official Statement and Release of Documents: In the event that the trial takes a strong anti-American turn in its propaganda, it may be appropriate for a high U. S. Government spokesman to make a comment. The outline for such a comment following the guidelines and strategy mentioned in paragraphs 1 and 2 above will be prepared. In addition, two Soviet documents, GRU lectures on Soviet intelligence techniques in the U. S. and on the techniques used for conducting meetings with agents will be prepared for release to the press as documentary evidence of the nature of Soviet espionage. The first of these documents is particularly significant for its content, and the latter because the author is currently assigned to the Soviet Embassy in Washington.

e. Further Release of Documents on Soviet Military Plans: Although this proposal will require careful review in the light of our long-range publicity plans in addition to numerous other considerations, the question of the release of two other documents is also being given attention. One of these is an extremely belligerent exposition of Soviet strategy and the second is a description of Soviet chemical warfare planning. Release of these documents might be most appropriately effected through the Department of Defense. The release would go a long way toward supplying documentary proof of the aggressive nature of the Soviet regime.

4. Plans for Long-Term Exploitation: Preliminary discussions between the British and ourselves concerning long-term exploitation have taken place already. Our plans will be reviewed in detail in conversations to take place in London at approximately the time of the Wynne trial in Moscow. As presently foreseen, the major effort will be the preparation of the "memoirs" of Penkovskiy, based upon the voluminous information from contacts with him, to present as thoroughly and as carefully as possible Penkovskiy's own views on the nature of the Soviet regime, its history and its prospects. To accompany these memoirs, appropriate documents will be selected from those available to us for release to the public. These two items, the memoirs and the documents, would then be made public with the explanation that they had been left in

the West in the personal possession of a confidant who was charged by Penkovskiy with making them public in the event his efforts to struggle against the party dictatorship in the Soviet Union led to his arrest. This explanation will stress the idea that Penkovskiy's arrest and trial stemmed not from service as a western intelligence agent, but rather from his burning desire to fight the Soviet regime as currently established. In addition to other considerations, putting this plan into effect would have to await a final resolution of the fate of Wynne. In the meantime, however, preparatory work on the memoirs has begun in London.

10 May 1963

MEMORANDUM FOR: Chief, SR Division

SUBJECT: Oleg V. Penkovskiy

1. This afternoon I handed you a draft plan designed not only to assure that word reaches many GRU and KGB ears that U.S. Intelligence is concerned about those who collaborate with us and who may be caught but also to grasp whatever slim opportunity there may be to save Penkovskiy's life.

2. On the first point, there is no doubt that many GRU and KGB officers realize that CIA was able to run a highly successful operation in a professional manner. Their respect for CIa must have gone up. They do not know what interest CIA has for the security and well-being of anyone who collaborates. If indeed word should be spread about that U.S. intelligence is trying to save Penkovskiy's life, this is bound to have a tremendous impact on many in the ranks. The need for other Oleg Penkovskiys, as the Director expressed to you, is greater now than ever. We must do all we can to achieve this.

3. On the second point, we all know of the tremendous contribution that Oleg Penkovskiy made to our Government and to our Agency. We were at one point prepared to give him an unusually large sum of money whenever it was feasible for him to defect. As a professional intelligence officer, he was well aware of the risks he was taking for himself and for us. I feel we owe him a tremendous debt. For us not to consider ways and means of saving his life is to me a reflection of low moral level. I do not suggest any reckless or ill-conceived means.

APPROVED FOR RELEASE
31 MAR 1992

[redacted]

1.3(a)(4)

[redacted]

1.3(a)(4)

4. As you know, last November 1962, I proposed this plan in written form to C/CI who turned it down with a reason I could not then, and cannot now understand or accept. I am addressing you formally on this point with the view of obtaining a formal reply which would include, should the proposal or any variation of it be turned down, the reason or reasons for the turndown.

1.3(a)(4)

[redacted]

14 May 1963

1.3(a)(4)

MEMORANDUM FOR: Chief, SR Division

SUBJECT: Plan for Informing Soviet Intelligence Services of U.S. Concern for Oleg V. Penkovskiy.

1. The following plan is designed not only to assure that word reaches many GRU and KGB ears that U.S. Intelligence is concerned about those who collaborate with us and who may be caught but also to grasp whatever slim opportunity there may be to save Penkovskiy's life.

2. On the first point, there is no doubt that many GRU and KGB officers realize that CIA was able to run a highly successful operation in a professional manner. Their professional respect for CIA must have gone up. They do not know what interest CIA has for the security and well-being of anyone who collaborates with CIA. If indeed word should be spread about that U.S. Intelligence is trying to save Penkovskiy's life, this is bound to have a tremendous impact on many in the ranks. The need for other Oleg Penkovskiys, as the Director expressed to you recently, is now greater than ever. We must do all we can to achieve this.

3. There is no question in our minds that the impact of the Penkovskiy compromise and trial will have a deleterious effect upon any Soviet citizens, in or out of the RIS ranks, who may have entertained thoughts of either defection or working in place. Following the trial, Yuri Zhukov, commentator for PRAVDA stated "CIA does not give a hoot about the fate of their agents. All the promises they made to Penkovskiy.....have been broken. The spy is caught and he has been written off the books." This is the sort of Soviet action that the proposed plan will counter.

4. The plan envisages four identical letters to be delivered to two KGB rezidents and two GRU rezidents in Bonn, The Hague, Copenhagen and Rome. A local indigenous person can be paid to deliver a sealed envelope containing the message to the Soviet Embassy in each city. The reason four points were chosen was from our point of view to insure that delivery is made, that the message is not thrown out as a provocation since the letter states that three other identical messages are being simultaneously delivered in three other Soviet Embassies and particularly to assure that by word of mouth that at least a minimum number of Soviets who see the letter will pass the word around to their associates without

[redacted]

1.3(a)(4)

APPROVED FOR RELEASE
31 MAR 1992

[redacted]

1.3(a)(4)

raising in Soviet minds that a flooding of many Embassies with such messages was strictly a CIA propaganda ploy. Not only to establish a bona fide with the Soviets but also to worry them regarding intent, a copy of the photograph of Penkovskiy with Chief Marshal S.S. Varentsov will be included.

5. The question of whether Soviet authorities would surface this message to embarrass us is considered to be most unlikely since publication would only serve to further our interests. There is, despite our optimism on this point, no genuine attributability which the Soviets would gain by surfacing.

6. The four cities were chosen because the fact that they are in NATO countries may have the proper impact on the Soviets, and have had no past relationship with the Penkovskiy operation, and the remote chance of any flareback would have minimal effects in these particular countries.

7. It is suggested that the Soviets be directed to respond to a Post Office box in New York, which could be laid on by Security. In the event of a flap, the Post Office Department could easily deny the true identity of the holder of the box.

8. Should the Soviet authorities respond to the message, an analysis of the nature of their response would dictate our next moves. Certainly the negotations in the beginning stages could be prolonged and vague. There will obviously be feeling out by the Soviets as to the nature of the "stick" and the "carrot".

9. It is recommended that this proposal, if accepted, be carried out without any reference to the British, in the light of the Soviet statement that "CIA does not give a hoot about the fate of their agents". In no way, does the plan envisage the problem of Wynne and Lonsdale.

10. Should the Soviet authorities refuse to respond, it is recommended that we carry out our threat by the appropriate publication in appropriate places of certain materials which Penkovskiy gave us relating to Soviet espionage abroad and to Soviet subversive planning and warlike views of the Soviet Government. There is much CA grist which can and should be pulled out and exploited by the West.

11. The Soviets will recognize this as a U.S. proposal and not a joint American-British proposal. This should in no way jeopardize whatever plans the British have for negotiating with the Soviets for the release of Wynne.

APPROVED FOR RELEASE
31 MAR 1992

[redacted]

[redacted]

Bona Fides of the Penkovskiy Operation

1. We have no reason to believe that Penkovskiy was a double agent or that any information he supplied us was wittingly provided to him as deception material by Soviet authorities.

2. Throughout this extraordinary operation, a recurrent question for us, and one also in the minds of analysts trying to cope with the resultant flood of classified Soviet documents, has been the possibility of Soviet deception. This possibility was given serious consideration each time we received new material from Penkovskiy. During the numerous long personal meetings we had with him we used subtle and varied tests of his loyalty and his information; we also checked the intelligence provided against all other information available to the intelligence community. He always passed all of the tests which could be levied on him personally and his information has stood the tests of time and comparative intelligence.

3. On the basis of ~~these~~ checks and counterchecks together with our familiarity with the methods and purposes of Soviet deception operations, we have concluded that there is no possibility that this case represents planned deception, build-up for deception, fabrication, or double agent activity. Rather it represents the most serious penetration of Soviet officialdom ever accomplished and one that will hurt them for years to come.

Dep. 17

8 July 1963

MEMORANDUM FOR: The Director of Central Intelligence

SUBJECT : Penkovskiy case

1. You already have a memorandum giving our views on how we believe Penkovskiy may have been caught by the Soviet authorities, although we have to date received no precise information which leads us to believe that we have a definitive explanation. I would like to add the following information which we received the middle of last week from [redacted] during a controlled debriefing conducted by a staff officer of this Agency. 1.3(a)(4)

2. With respect to Penkovskiy, Source stated, "our people" in the United States realized that some important information was leaking out of the Soviet Union. A discreet investigation took place and by the process of elimination led to Penkovskiy. When pressed for details as to whether Soviet agents in the United States had learned of the information acquired by the United States, Source commented that he only assumed that persons (Soviet) in the United States had learned that the United States Government had obtained this information. [redacted] 1.3(a)(4)

X 3. Also, according to Source, Khrushchev mentioned in December 1962 at a gathering in Kiev attended by Tito and others, that Penkovskiy had done a lot of harm but also that he had done some good simply on the grounds that now the United States knows the strength and technological advancement of the Soviet Union.

4. Source also claimed that because of Penkovskiy there have been many changes made in Soviet defense but that these changes tend to be minor and not basic.

FW 15

Dep 17

6 November 1964

MEMORANDUM FOR: Deputy Director (Plans)

SUBJECT: Request Approval to Publish
The Penkovskiy Memoirs

1. Attached as Tab A is a precis of the second draft of the Penkovskiy Memoirs. The first draft was written in Russian by Peter Deryabin, assisted by the entire SR [redacted] 1.3(a)(4)
As source material the tapes of all 45 meetings with Penkovskiy were reviewed. Other materials and reports submitted by Penkovskiy were also studied. The SR case officers who worked with Penkovskiy were consulted to get an insight into Penkovskiy as a person. The first draft of the Memoirs was then translated into English, preserving Penkovskiy's style (and often his exact words) and Russian flavor. Publication of the first draft of the Memoirs was delayed by objections of the British Intelligence Service, who were concerned about the effect on the case of Greville Wynne, then still in Soviet imprisonment.

2. After Wynne's release SR undertook to find a competent writer who could revise the Memoirs into a form more suitable for publication. Mr. Frank Gibney agreed to edit and rewrite the Memoirs. The second draft of the Memoirs was undertaken in accordance with the following premises:

a. The Memoirs were ostensibly smuggled out of the USSR after 25 August 1962, which date is the last one mentioned by Penkovskiy in the Memoirs. (At this time Penkovskiy already knew he was under heavy surveillance, and he purportedly smuggled out his Memoirs before his arrest, which we believe took place about 1 September 1962. For further comment on the plausibility of smuggling and other aspects of the ostensible acquisition of the document in the West, see Tab B.)

b. Clandestine operational details included in the story, which refer to the connection between Penkovskiy and the British and American intelligence services, come from overt sources. In December 1963 the Soviet Political Literature Publishing House in Moscow published the transcript of the Penkovskiy-Wynne trial.

APPROVED FOR RELEASE
31 MAR 1992

[redacted]

Our translation of this Soviet book not only provides the continuity for the Memoirs, interspersed as it is between the chapters; but it also provides us the basic information on Penkovskiy's espionage activities without the need to include any other specialized editorializing which could be attributed to CIA. The Wynne Memoirs published in the London Sunday Telegraph in September also provide valuable background and authentication material.

c. We should not try to glorify Penkovskiy. The picture of Penkovskiy-the-man which thus emerges is not only an accurate one, but also one which is interesting and believable.

d. Our fourth premise is that the placement of the book for both serialization and publishing should be done through commercial channels, taking into account the interest already expressed to CIA by certain media. (See Tab C for details on suggested publishers, syndicates for serialization, etc.)

3. Financing. We must early recognize that the financial income from the Penkovskiy Memoirs will be great. This includes income from newspaper syndication, the published book, foreign book rights, possible selection for Book-of-the-Month Club, and the very real possibility of an eventual movie or TV program based on the Memoirs. Mr. Gibney believes, and we agree, that a substantial sum should be charged for this material, because of the "If-it-is-given-free, no-one-will-appreciate-it" rule. After the normal deduction of the agent's fees, we believe the proceeds should go to a recognized anti-Communist organization. Problems relative to the allocation of the income from this book will be discussed the Office of the Legal Counsel and CDODS.

4. Timing. Publication of the Penkovskiy Memoirs has been complicated by the recent demise of Khrushchev. On the one hand, the press daily carries new comments and revelations about Khrushchev' downfall. It is clear that every hack Kremlinologist or purveyor of revelations will be in the act soon. As much of this horrendous revelation material begins to appear, it operates like an inexorable Gresham's Law to debase the currency in general. On the other hand, Penkovskiy's espionage activities were directed against the Khrushchev regime. The Chicago Tribune's recent American publication of Wynne's memoirs is good advance billing for our publication. The new Soviet leadership is still disorganized and might not marshal a good effort to discredit the Memoirs. We should take advantage of the news at this propitious moment to syndicate the Memoirs in a newspaper or magazine as quickly as possible. The earliest date we can expect for publication of the book is March/April 1965.

5. Approval Requested. Publication of the Memoirs was cleared by the DCI with Mr. McGeorge Bundy in 1963. We recognize that both the domestic and international political scene has been considerably altered since 1963. Therefore, we cannot assume that Mr. Bundy's early clearance for publication is still valid. However, we do not feel that the content of the Memoirs requires clearances from other U. S. Government agencies, such as State and the Department of Defense. Our early publication would be greatly expedited if we could limit further clearance within the Government to a new clearance from Mr. Bundy. Essentially, approva is requested for us to authorize Mr. Gibney to enter into negotiations for early syndication and publication of the book with the appropriate publishers we have suggested.

MEMORANDUM FOR THE RECORD

SUBJECT: Meeting with J. Bromley Smith

1. I met Mr. Smith at 1100 on 22 April at his office in the White House to discuss with him the inclusion of the Prikhodko Lecture in THE PENKOVSKIY PAPERS. I explained to Mr. Smith the importance we ascribe to the lecture as a part of the book in that it provides a unique documentary source for allegations of Soviet intelligence activities in the United States. I said that it was not only a convincing and impressive document but also one with several passages of considerable unconscious humor for the American reader at least. Mr. Smith appeared to accept the importance that we ascribe to the document without question.

2. I then informed him of the history of the document, explaining that Mr. Murphy had not taken it up with him earlier because at that time we had not received clearance on using it from the FBI, a clearance we now have. I then stated that approximately two years ago the release of the document by the Government, I thought by the Department of Justice, was contemplated, and the question at that time had been referred to the White House for a decision. I said that Mr. Helms's recollection of the circumstances was that President Kennedy had decided against releasing the document after consultation with Llewellyn Thompson, the basic reason for a negative decision being that the negotiations for the Test Ban Treaty were then underway with the Soviet Government. It was therefore considered inappropriate for the Government to release a document of this sort. I then pointed out that we considered that the circumstances of today are different in that negotiations of that type are not

APPROVED FOR RELEASE

1.3(a)(4)

[redacted]

underway with the Soviet Government at present and, most importantly, that we now plan to incorporate the document in a book which will appear under private auspices rather than have it released by an official agency of the U. S. Government. I further said that in order to preserve the cover of private preparation of the PENKOVSKIY PAPERS, the lecture would be translated anew so that Agency participation in the preparation of the book could not be proved by comparison of the two English texts of the lecture. I noted that the introduction to this chapter says that it can be presumed that Penkovskiy also gave the lecture to his Anglo/American intelligence contacts.

3. Mr. Smith appeared to be favorably disposed toward the proposal, but said in view of the incident in 1963 he thought he ought to check with Mr. Bundy about it. He said that he would do so as soon as possible and let me know what the decision was by Saturday, 24 April.

4. I informed Mr. Smith that we were going to solicit Dean Acheson's support for the Penkovskiy Fund tomorrow morning. He asked that I call him to let him know how we made out. He said that he could not predict how Mr. Acheson might react.

5. (Prior to seeing Mr. Smith, I checked with [redacted] as to the advisability of raising the following item which I forgot to mention yesterday to the DDP. [redacted] urged me to take it up with Smith, and I did so.) I told Mr. Smith that Cornelius Ryan is a personal friend of mine and had recently telephoned me to say that he would be pleased to write or contribute to a speech for the President or some other high Government official on the anniversary of VE Day. Ryan's specific contribution would be a passage itemizing the massive extent of U. S. lend-lease to the Soviet Union during World War II. Ryan suggested that the subject might be led into by an observation concerning our current military aid to South Vietnam and the record of American military support to other countries fighting for their independence. Ryan has a complete itemized list of all the materials sent to the Soviet Union under lend-lease and believes that simply reading off major items on that list of materials would be a very impressive rebuttal of the frequently repeated Soviet charge that lend-lease was of minimal importance to the Soviet

[redacted]

[redacted]

prosecution of the war. Mr. Smith said that he welcomed the offer greatly and that Mr. David Cline of his office was at present working on a draft of a Presidential speech for that occasion. He said he would take the matter up with Cline and ask that Cline call me about Ryan's participation.

29 November 1965

MEMORANDUM FOR: Chief, SR Division

SUBJECT : Considerations re Declassifying Military Thought

1. Penkovskiy provided us with eight issues of the TOP SECRET version of Military Thought. These were published by us as a total of 74 CSDB reports (71 individual articles plus three tables of contents). He also provided us with two complete and one incomplete issues of the SECRET version of Military Thought. These were published by us as a total of 56 CSDB reports (53 individual articles and three tables of contents). These 130 CSDB reports are now classified SECRET/NO FOREIGN DISSEM/NO DISSEM ABROAD.

2. Of these 130 reports, 89 have been released to [redacted] and 61 have been released to other NATO countries plus a few others. Our decision to release them to liaison services was determined in large measure by the fact that because Penkovskiy had signed for these documents in the CRU Library, the Soviet damage assessment already included them. 1.3(a)(4)

3. Any downgrading of the classification of this material must be done in coordination with MI-6. We believe that, in addition to propaganda repercussions, the following probable ramifications should be taken into account in any decision to downgrade the classification to UNCLASSIFIED:

A. Intelligence Community Reaction: The Intelligence Community would probably react favorably (or at least not unfavorably) provided they received advance notice of the kind described in paragraph 4 below.

APPROVED FOR RELEASE
31 MAR 1992

[redacted]

[redacted]

B. Liaison Service Reaction: The net effect on liaison services would probably be negative for two reasons:

1) Declassifying reports passed to them would negate the purpose we allegedly had in releasing the reports in the first place, i.e., enhancing our liaison relationship by passing highly valuable, sensitive material. The negative effect of declassification would depend on what real effect the release had on our relationship. This will vary from service to service.

2) Liaison services would learn that we withheld a significant number of reports from them in a series which we had decided to pass. (The book, of course, implies the existence of still other material withheld.)

C. Soviet Reaction: Although our earlier release to liaison may very well have given the Soviets copies of the reports, declassification will insure their receipt of the series. This will upgrade the quality of their damage assessment of the case by confirming the consistent excellence of Penkovskiy's photography (98% read-out), thereby maximizing the damage assessment. Releasing the Russian language original to the general public (see para 3D below) would even further acquaint the Soviets with our photographic technique and its degree of success.

D. Public Reaction: Declassification would make a large volume of highly significant Soviet material available to students of Soviet affairs around the world, thus upgrading their competence to analyze subsequent Soviet developments. To be most useful to scholars, the Russian language original should also be released. This would require borrowing the Minox negatives from MI-6 and would have security ramifications (see para 3C above).

[redacted]

[redacted]

4. Prior to any overt downgrading of the classification of this material, an official notice should be sent to USIB agencies notifying them of our intentions and of concomitant changes in classification and dissemination controls of the intelligence reports. The CSDB reports per se cannot be downgraded lower than CONFIDENTIAL/NO FOREIGN DISSEM because of their format and report numbers, but this much could be done along with notification to recipients that the substantive content could henceforth be treated as UNCLASSIFIED.

5. From a logistical standpoint, copies of the reports to be released outside the Intelligence Community would either have to be re-reproduced or physically sanitized by chopping off the top and bottom of each page and - for some reports - deleting various references scattered through the text. Time to be allowed for this would run from a few days to several weeks, depending on which method and how many copies were involved. It would make most sense to reassemble the material into its original sequence as it appeared in the various issues of Military Thought and present it in a single, coherent package.

PLAN (DIAGRAM) FOR MARKING SIGNALS

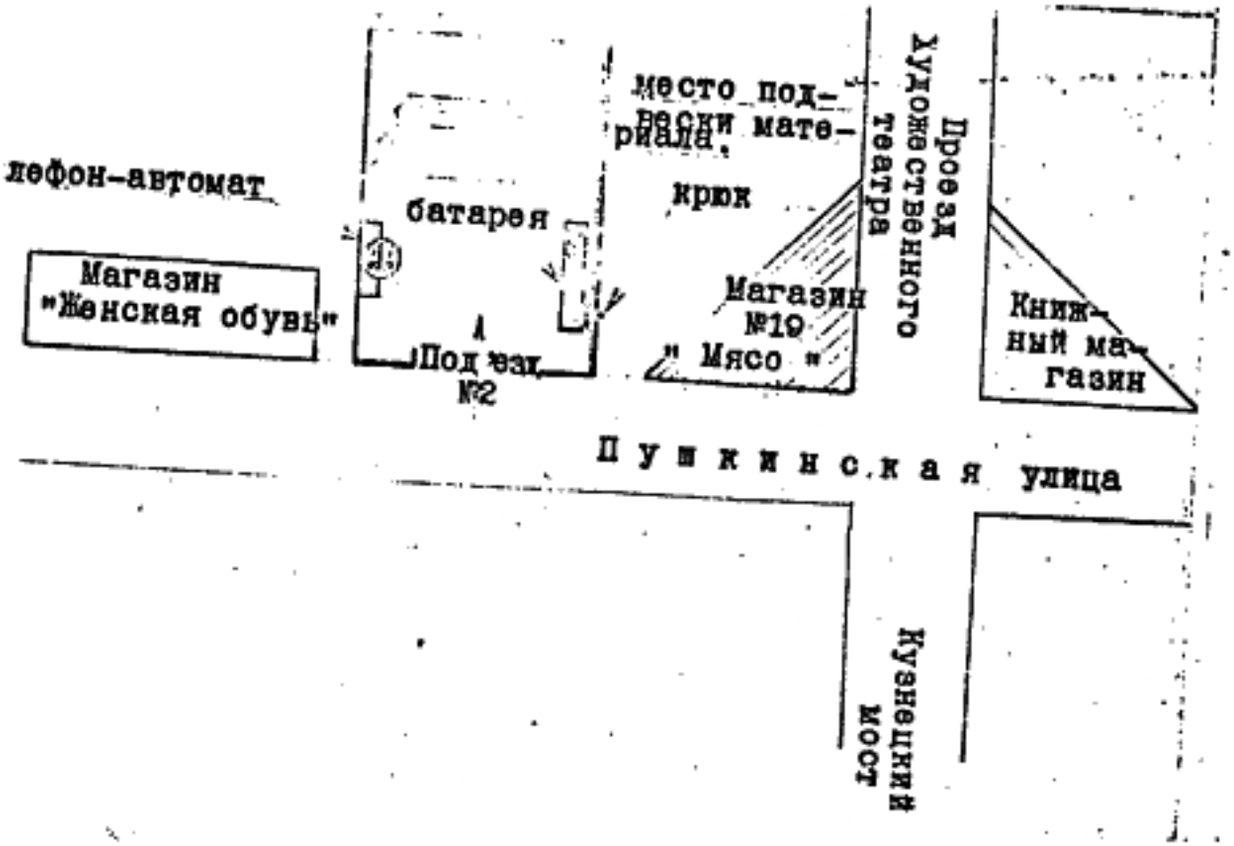
APPROVED FOR RELEASE
31 MAR 1992

PLAN (DIAGRAM) OF DEAD DROP SITE AND ITS LOCATION

Description of Dead Drop Number 1

Address and Location:

Moscow, corner of Proezd Khudozhestvennogo Teatra and Pushkinskaya ulitsa. The dead drop is located in the main entrance (foyer) of Number 2, located on Pushkinskaya ulitsa--between the store Number 19 "Myaso" and the store "Zhenskaya obuv'."
The main entrance is open 24 hours a day. The entrance is not guarded, there is no elevator.
In the entrance (foyer)-to the left /upon entering therein/a dial telephone, No. 28, is located. Opposite the dial telephone /to the right as one goes into the entrance hall/ is a steam heat radiator, painted in oil paint in a dark green color. This radiator is supported by a single metal hook, fastened into the wall. /If one stands facing the radiator, then the metal hook will be to the right, at the level of one's hand hanging from the arm./
Between the wall, to which the hook is attached, and the radiator there is a space of two-three centimeters.
For the dead drop, it is proposed to use the hook and the space /open space/ between the wall and the radiator.



Method of Using the Dead Drop:

It is necessary to place and camouflage any written material, for example, in a match box, then, the box should be wrapped with soft wire /of a green color/, and the end of the wire bent hook-shaped, which will permit the small box to hang from the hook (or bracket) of the radiator between the wall and the radiator.

The location of the dead drop is on the unlighted right-hand corner of the entrance hall. In the entrance hall it is convenient to make a call on the dial telephone and it is very simple and easy to hang some type of small object on the indicated hook.

The site for placing the signal indicating that material has been placed in the drop, is located at a five minutes' ride from the dead drop /or a fifteen minutes' walk/. Thus the time that the material is in the dead drop can be held to a minimum.

I will await the signal indicating placing of the material in the dead drop after 12.00 and after 21.00 each day, beginning with 15.8.60.

Моя дорогая КОРОЛЕВА!
Мой дорогой ГОСПОДИН ПРЕЗИДЕНТ!
Мои дорогие ГОСПОДА!

В своем первом письме от 19.7.60. я уже сообщал о том, что по-новому осознал свое место в жизни, о своем решении и готовности посвятить себя Делу борьбы за настоящий, правдивый и свободный Мир для Человека. За это дело я буду бороться до конца.

Я прошу Вас считать и меня своим солдатом. Пусть отныне Ваши Вооруженные Силы увеличатся на одного человека.
В моей преданности, твердости, самоотверженности и решительности в борьбе за Ваше /теперь и мое/ Дело - можете не сомневаться.
Вы не раз будете довольны мной, не раз вспомните меня добрым словом. Ваше признание - я завоюю. Для этого не потребуется много времени.

У меня несколько личных просьб.

1. Прошу рассмотреть вопрос о предоставлении мне со временем гражданства США, или Великобритании.
Прошу также присвоить мне по Вашему усмотрению воинское звание армии США. Я имею достаточные знания и опыт, и не только сейчас, но и в будущем могу принести определенную пользу, работая непосредственно в США, о чем очень мечтаю.

2. Прошу Ваших указаний об осторожной, продуманной, конспиративной работе со мной со стороны Ваших работников.

3. В настоящее время я вручаю ряд материалов, собранных за последний год. Прошу Вашего указания об оценке их и об определении положенной суммы за эти труды, т.к. особых накоплений а меня нет, а деньги в будущем потребуются. Положенные мне суммы прошу поместить в один из банков США.

Таковы мои личные просьбы.

Еще раз заверяю Вас о своей безграничной любви и уважении к Вам, к Американскому Народу и ко всем тем, кто находится под Вашим Знаменем. Я верю в Ваше Дело. Готов выполнять любые Ваши приказы. Я жду их.

Остаюсь, всегда Ваш ....

C: Ya proshu vas mne pomoch. As I recall.

B: Ya proshu

C: vas mne pomoch. .....and then he says ....

B: Did he give any reasons for what he was doing? His motivation.

C: This is what Henry couldn't understand and this is what bothered me at the time. We asked him why and his answer was probably that he was tired of the regime. In fact, we asked/him what life, are you a Communist. Just right out point blank, are you a Communist? And he says byl.

B: Byl.

C: Byl.

APPROVED FOR RELEASE
3 1 MAR 1992

B: It means I was. What was the impression there--that he was a Communis in spirit or actually a member of the CP?

C: My impression was that he was a communist in spirit. I don't think he was a Party member. But this was the impression that I got. But Henry just turned to him and said point blank are you a Communist? And he says byl. And then he asked then he said he had very important information that to give to the government and he asked is it possible for us to give--these are not his exact words--but if it would be possible to give the information to a .....and

B: Did you respond?

C: Yes, I said if we could be of assistance we don't care, as I recall, I said that we didn't want to create trouble. Because at some time in the future we might want to come back to the Soviet Union but I think he said something about that he. We didn't have to know the knowledge ourselves or some such thing. But then he told us about this U-2 incident and I couldn't understand why unless he was trying to convince us about the importance of the information he had to give us and he made reference to these two letters. And then he started describing the U-2 incident and the RB-47 incident both. ..give us all the details of ...

B: Could you repeat this?

C: Yes. He said he described the U-2 incident first. He said the U-2 was shot down and there was never a direct hit. He said not one but 14 rockets were fired and in the process, well they destroyed one of their own planes that was tracking, following him. And it was some Lt. He didn't give the name. I asked him, did he know the name of the lieutenant and he said no. Therewas a lieutenant though killed in that flight.

B: What kind of a plane was it?

C: He said It was a fighter plane. I asked was it a bomber, fighter. He says fighter

[redacted] 1.3(a)(4)

but he didn't give me the type. I don't know.

B: Are you sure he didn't [redacted] say Mig?

C: No he didn't say--he didn't give the type. Except for the fact that he said it was a fighter plane "TOCHNO"

B: But he said fourteen?

C: Fourteen. I asked him [redacted] two or three times about it. I said are you sure. He said yes.

B: All right. May I ask you this now.

C: He said "chytirsatsad raket".

B: He didn't say what kind of "raket".

C: No. And he said that ....

B: Ground to air or air to air?

C: I asked him that - air to air? - I asked him "From the plane?". He said No, the plane wasn't equipped with rockets. Or, wait a while- did he say - no, I believe he said the plane wasn't equipped with rockets. That he had machine guns but the rockets - were any of them from the plane. He said no, they were all from the ground.

B: He certainly had a specific figure - 14. Not many or several or few but exactly 14.

C: This I couldn't understand either. He kept repeating the figure 14.

B:: Did he say where he had the information from?

C: I said Do you have direct access to this and he said no, from a friend.

B: Did he describe his friend - from the air force, military or anything?

C: No, he said he was a - how did he put it? - that's all he said "An officer friend". But he wouldn't tell me what service he was in or what his rank was.

B: He said there were no direct hits?

C: No direct hits. [redacted] He said that apparently either the concussion from one of the rockets came close and either the concussion caused the engine to malfunction or else perhaps some shrapnel - at least it came close and this - there was no direct hit.

B: Did he refer to engines or are you forming impressions now?

C: No, let me think now - most of this was in English except the RB*47. On the RB-47 he reverted to Russian. But when he came to the number, I asked him to repeat it in Russian and he verified this, he said exactly 14 rockets.

1.3(a)(4)

B: Did he use the English work "rockets"?

C: Yes, but he said it both in English and in Russian but re the RB-47, I don't believe he used one word of English on that - he used all Russian - he spoke English fairly well. In fact, I'd say almost - as far as military language, he knew more English than we did Russian.

B: Let me read this "One rocket burst near the U-2 causing it to go out of control and fall spinning to earth".

C: Yes, that's right. He said the pilot lost consciousness so he acutally knew nothing about the thing- what happened.

B: The pilot lost consciousness - right after the burst?

C: Yes, he said it went out of control and they claim the pilot made a statement as to what went on but he says he couldn't know because he lost consciousness.

B: Next statement is "As the U-2 went spinning to earth Powers ejected". That sounds as if he was conscious. You see, I don't have much faith in the transmission of information from individual A to B to C. That's why I'm asking you these questions.

C: This I couldn't understand either. How could he eject if he was unconscious. He said the pilot - how did he say it? - this may have been the case where he made the statement and we didn't understand it and he had to say it in English.

B: Is this correct then - the first statement I read "One rocket burst near the U-2 causing it to go out of control.." - why? The U-2 is a very delicate instrument, as I understand it. Was it just out of control by being thrown off just like a fellow who is running very quickly -give him a little nudge and he'll fall to the ground. Whereas no actual damage was received.

C: This is what I couldn't understand. Was it shrapnel or concussion or what? But he did say that Powers was unconscious - he was unconscious the whole time. But this had me puzzled too. How could he eject? Unless - is there an automatic mechanism that could kick the pilot out or - I don't know.

B: He was unconscious when he hit the ground?

C: He said that he was unconscious all the whole time - he couldn't have known what went on.

B: Did he say anything about the altitude at which Powers was flying?

C: Yes, he said it was strictly high - that the plane could not get up to him.

B: But the rockets reached at that altitude?

whistling on tape

C: I can't tell you.

B: What else did he tell you about the U-2?

C: He did make the comment "How could the U-2 receive a direct hit if it wasn't

1.3(a)(4)

torn up. He said if it would have received a direct hit - then it would have disintegrated.

B: There a statement here "There was a MIG-19 trailing the U-2 at a lower altitude".

C: MIG-19? Did he say that?

B: Did he say MIG-19 or MIG-17 or what. Before it was said that the RB-47 was shot down by a MIG-19.

C: This I remember - that the 19 was connected with the 47 but I don't remember that the 19 was connected with the U-2. He mentioned that the MIG-19 was at a lower altitude to the 47 now why .....

B: Were those his exact words "lower altitude".

C: Yes, yes. In the case of the 47, he said the 47 was out of the range of the 19. Which seems odd to me, I thought the 19 could go as high as the 47. But he made out like it could not. It was too high or it and couldn't use his machine guns. He had to use his rockets. And it the rockets that brought him down.

B: The RB-47 was brought down by rockets?

C: Yes but he said it was not over the mainland either. I asked him how far. He said many kilometers from the shore. Then I said "It glided to shore or what". He said yes - it was hit but it was not destroyed. I guess there were two or three survivors.

B: This is what he said or-----?

C: I asked him if anyone lived from it -- he didn't know.

B: But he did say the RB-47 glided to land.

C: Yes, I don't know if he said "glided". I remember the reference of being hit, the plane was lower, and that the aircraft was hit but I can't remember whether he said it glided all the way to land or not.

B: Did he say the RB-47 was over internation waters?

C; Yes, mezhdunarodnaya vodoi, I believe these were the words but he did use the word "international", though. Yes, and he said there was no question it was not over Soviet territory.

B: Was there anything else that during this whole conversation--did he? Well, he was on the train from Kiev, he said. Did he say that was his home? Did he give any clue? Why was he on the train? Was he on a vacation?

C: He was on a vacation, but I can't remember whether he was on vacation from Moscow or from Kiev. Seems to me he was on vacation in Moscow.

B: This we'll have to establish.

[redacted]

1.3(a)(4)

C. I can't. I absolutely cannot recall.

B: Well wait awhile he had been carrying these letters since

C: ..... Yes he was. It seems to me he said he had--no--I'm just kicking around thoughts here. If he weren't on leave in Moscow then how could hex set up a date to be met. The ?? runs in my mind that he wanted to be met on th fifth day. ....and advised him of.

B: Met by whom?

C: A representative of him. And he said it's not to take place on the 16th, not to take place on the 17th, 18th and on and on but how could he do that if he didn't live in the area.

B: Did he say these exact words that he would like to be met on?

C: Yes, he said it describes in one side envelope where I was to be met and at what time. And he said the sixteenth is the date. But apparently he didn't pu inside there that he would be there. He said that if everything is set up for the (sounds like) sixteenth.

B: And it's not the fifteenth, he said the sixteenth?

C: Yes, he said the sixteenth or the day after or the day after and I could almost swear that he said forever.

B: Oh really.

C: He said that the sixteenth, if it's not the sixteenth, the seventeenth then he says and so forth. I could almost swear he said ~~na vsegda~~. Na vsegda.

B: Na vsegda.

C: I could swear he said that but I cannot remember for sure. But my impression was that he was going to keep coming back to this same place, keep coming back until he made his contact.

B: Well this would lead you to believe that he lived in Moscow?

C: Yes. The leave must have been in Kiev but with his Ukrainian accent he must have been there at some time or other. But it runs in my mind that he must hav been on leave in Kiev.

B: Did he give any indication as to who he was? Or what he was doing?

C: It runs in my mind that he was connected with the military but what rank, he never quoted his name or like hex I say I could almost swear that I heard the word colonel used once but he said--oh--now I remember. He said. I said who are you and all these things, what is your rank and number. He these questions will all be answered at the Embassy when they see what is inside here. He said you won't have any trouble knowing who I am. He said they know me. And we asked if any time in the futre would he care to come to the West? He said he thought so maybe in a couple of years.

B: Did he give the impression that [redacted] come out or that he hoped to come out. A wish or fond desire or did he give the impression that he might go out 1.3(a)(4)

on a [redacted] kommandirovka or with some/ Soviet Embassy?

C: No. It was permanent. Flee to the West. I used the word pobezhat. Pobezhat.

B: Defect in other words./ C: Yes. And he said maybe in a couple of years.

B: And he didn't give any indication as to how?

C: No. And, of course, the thought that came to mind was his family. Maybe he would want--what would he dowith his family if he himself came to the West and I think I asked him what about his family and it runs in my mind that he was going to try to get them out with him but the question dropped. He said well this is not important--the important thing is to get this information to authorities? Then I asked may I give you our address. If you ever get outside the Iron Curtain/you can write me or call or [redacted] anything. Call long distance collect or whatever could we help. He said no. He was afraid to write, to record it, because if it was ever found that would be it. But he said you won't have any trouble knowing who I am because when you deliver this, everybody will know who I am.

and you need help

B: He gave you two envelopes?

C: Two envelopes.

B: They were sealed.

C: Yes. He said one contained a letter from himself, instructions and that sort of thing, and the other contained a very important document.

B: What color was the envelope?

C: It was sort of an off color green or ....green turquoise, or light blue.

B: Anything written on the envelope?

C: Nothing. Just sealed blank envelopes and there was no seal or writing?. He was very very careful and Iput the letters in my pocket and I never took them out or looked at them until I got to the Embassy. He asked that we not open them.

B: And you didn't?

C: And we didn't. We discussed at length and it was right near the [redacted] end of the rendez-vous that he finally did give us the envelopes. As far as the possibility of being photographed, if we were, it would have been from one of the buildings across the street. We walked along the path right next to the river and if we were photographed, it would have been from across the street where the telephone lines interran through--

B: You accepted the envelopes at what point now? You said you walked here and [redacted] then you retraced. Did you retrace the whole time?

C: No, just once.

B: And then where did the path take [redacted] along.

1.3(a)(4)

C: Around here I think. We went down and I think right along in there. In other words, we went down a ways and then back and then the path comes out there.

B: You received it then and then you walked a couple blocks.

C: Yes.

B: Coming back to his motiviation you pressed on it a bit--were there any personal reasons that you could detect? How did you phrase that before--fed up?

C: Yes. Let's see how did he --

B: Now this is the ___, now this is the bridge you were talking about here.

C: (Portion muffled). ....cigarette here on that corner there. The bridge was here? Yes. Balchuk was right in here. That doesn't seem right though./ There was a street here. There was a street car that runs along here.

B: You don't remember the names of the street or the street you went up?

C: No.

B: But you would say it was how many blocks from the bridge?

C: Well we didn't go anymore than--to this street here--no more than two blocks.

B: Maybe one?

C: It would have had to been an awful long block. I think that it was about two blocks unless it was an awful long one. I believe it was two.

B: Do you know where the British Embassy is?

C: No, Sir, I've never been there.

B: In Moscow?

C: No. If I was ever there, I don't remember it.

B: Well coming back to this motivation again--try to recall what he said.

C: I'm trying to remember if it was some single incident or process of years or he had a personal grudge or someone in his family suffered or what. I am at a lost here. ..... I don't think that I had indicated anything to the Embassy either as I recall.

B: Now this Soviet citizen claims to be an infantry officer. Did you say that, Infantyy. Who was formerly a Communist but is no longer one. We'll clarify that.

C: Yes. Infantry--no, I don't recall that at all. In fact, I don't even recall the word for infantry. What is the word for infantry?

B: I don't recall either. You see why I don't trust the . Could he have said Red Army?

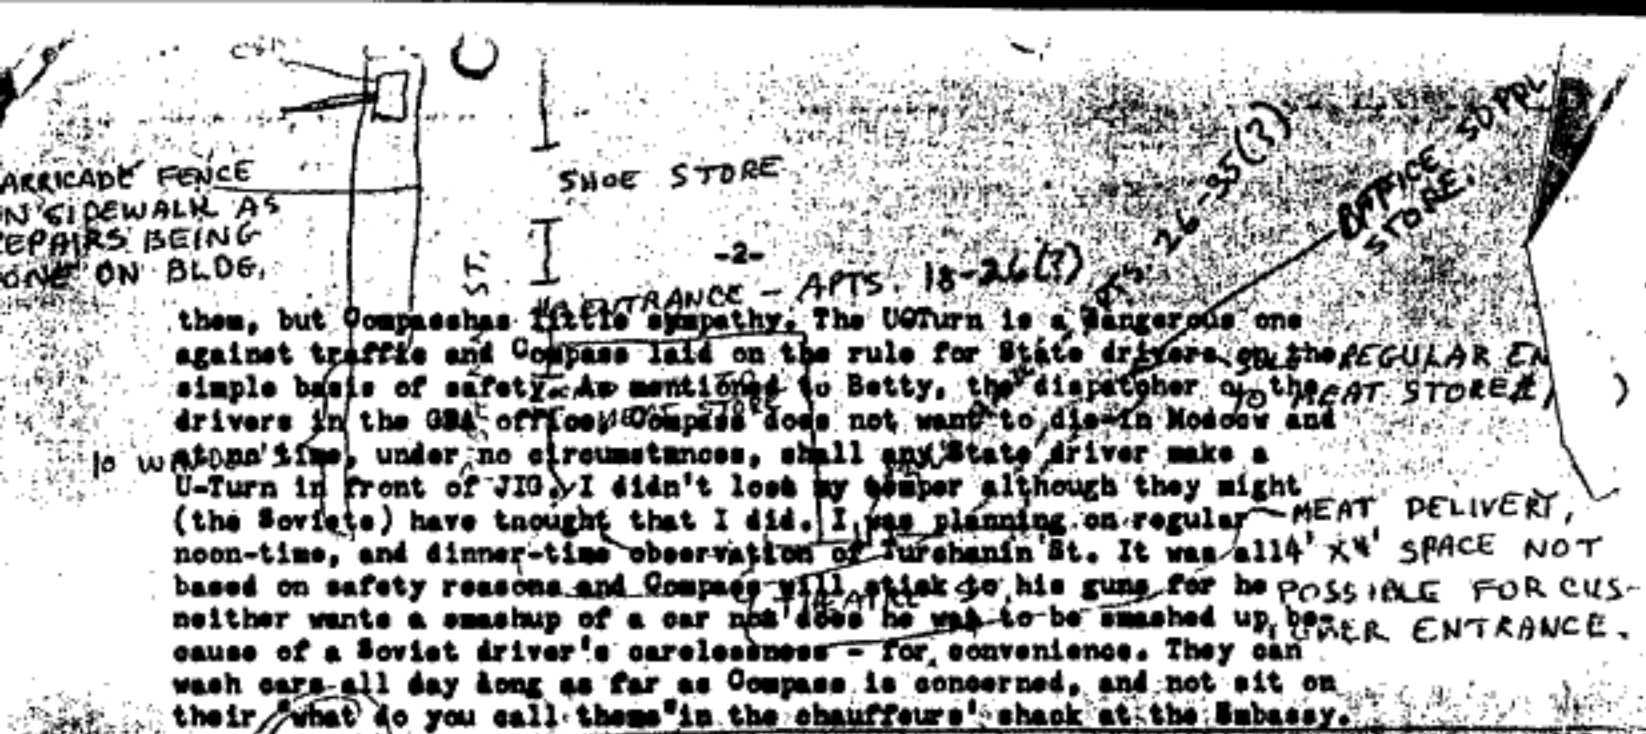
C: I don't recall.

B: Well we're coming close to the end of the tape. Are you hungry. (Discussion about stopping for lunch).
Well did you have a feeling of conference in this guy? 1.3(a)(4)

I gather that you did.

C: Yes, I did, In the case of Mr. _____, I was more confident.

B: You had more time with Him?



C: Yes, more time. The .. of a halfhour meeting was more difficult. I mulled over in my mind and before I took those envelopes, I said well this is it. Is it worth the risk? I said well if the information is there then it is worth the risk. I took the envelopes. In other words if it had been a propaganda buildup well they just kicked a couple out and it was a very definite calculated risk. But I decided that if the information was there (END OF TAPE).

[redacted]

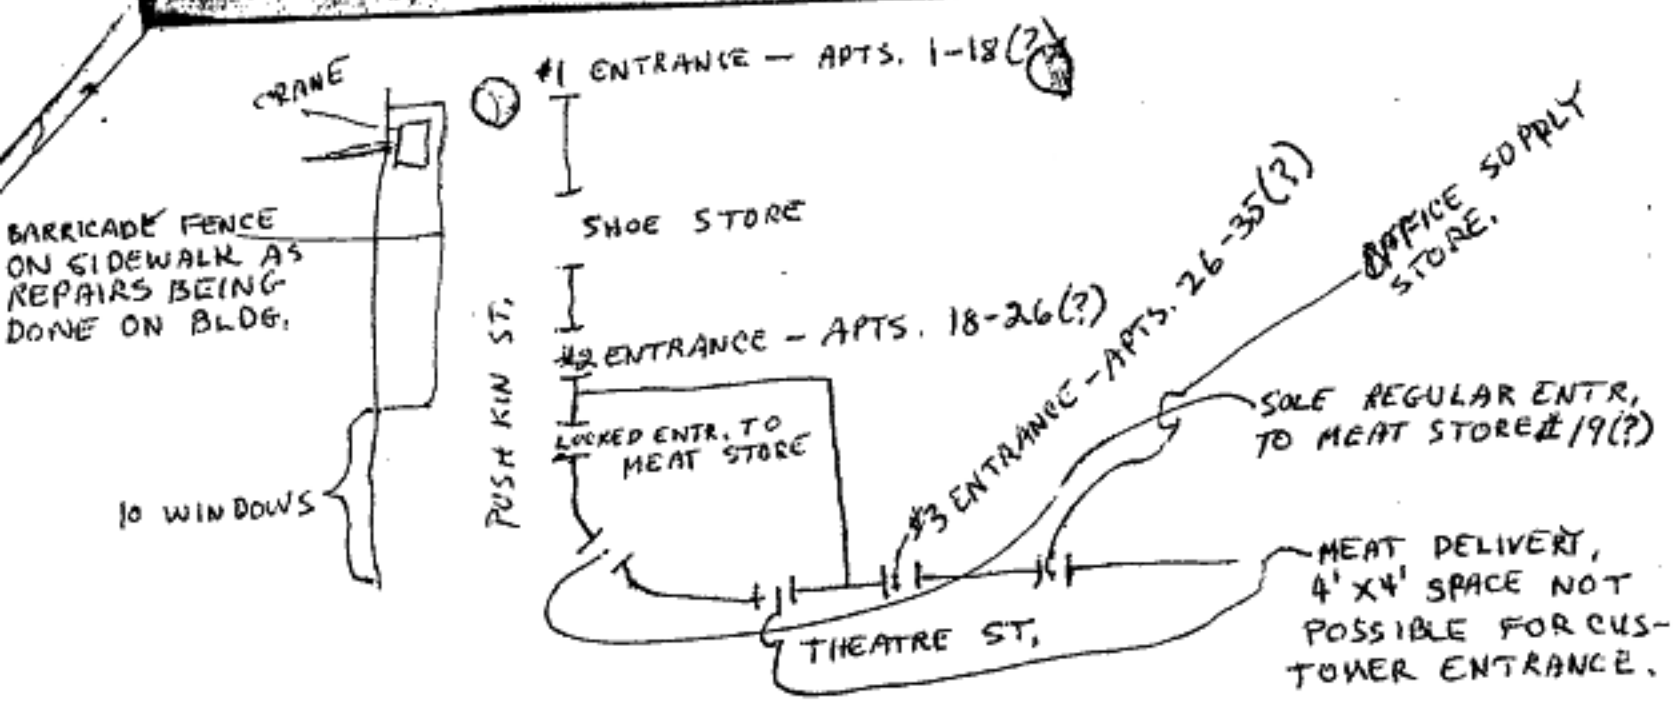
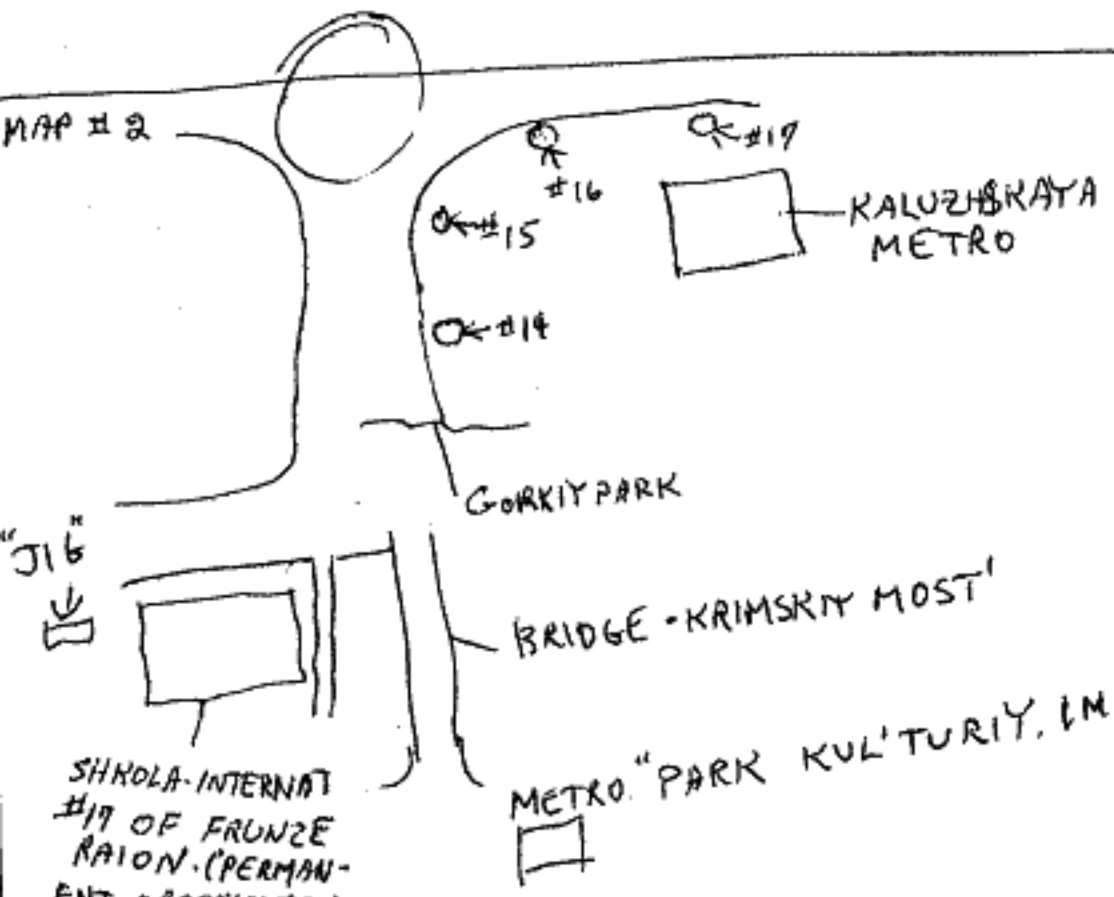
APPROVED FOR RELEASE

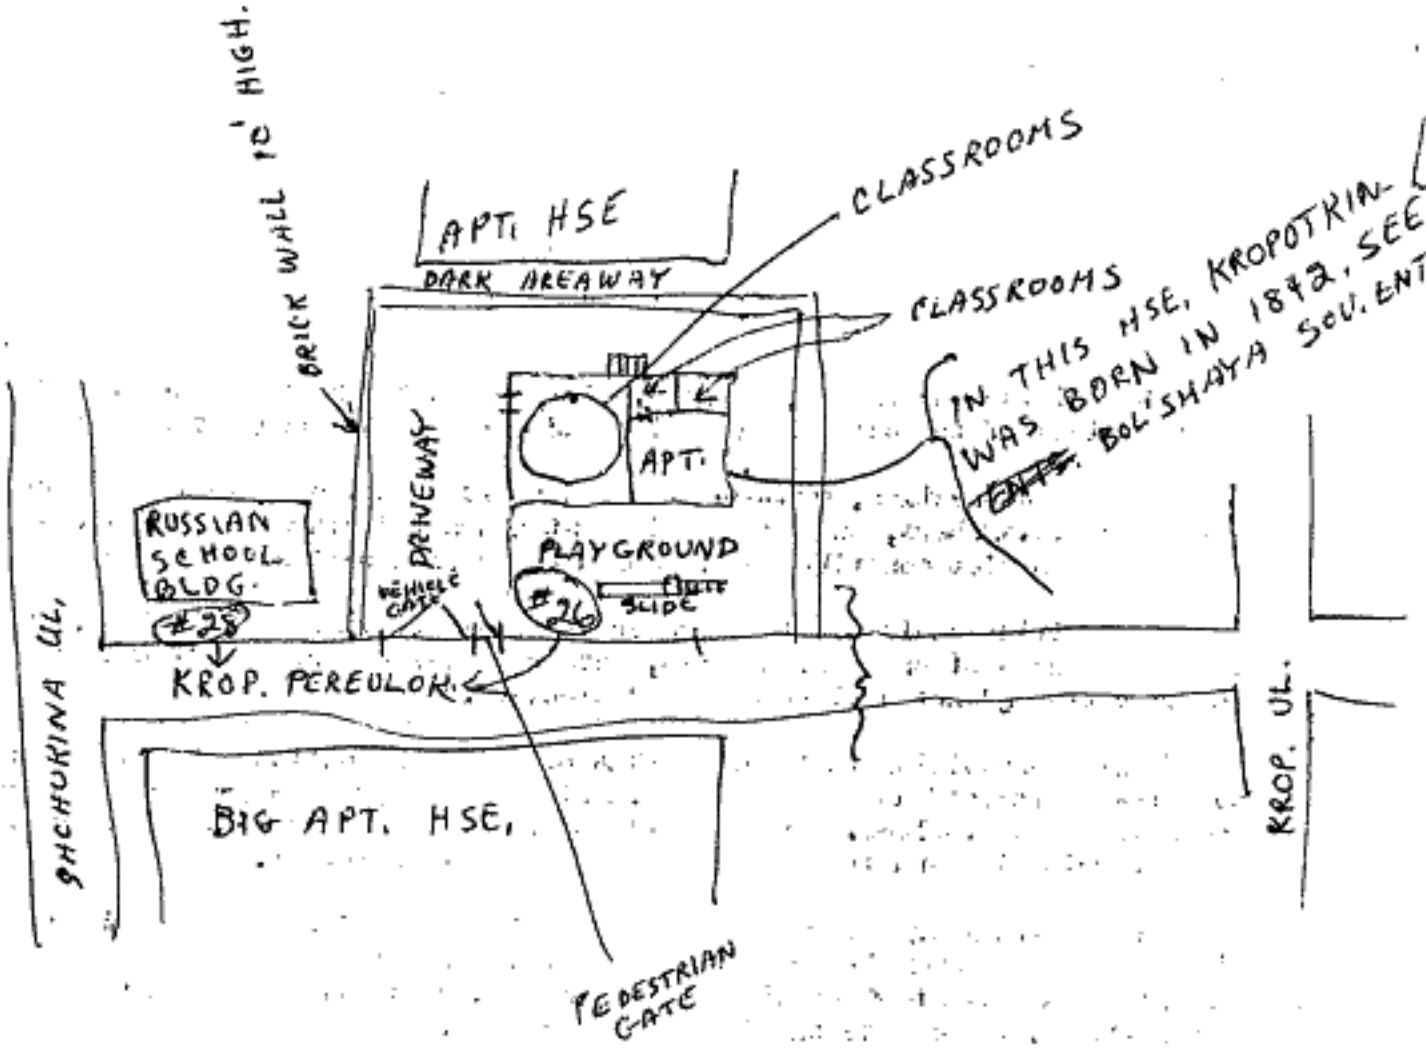
-2-



them, but Compass has little sympathy. The UOTurn is a dangerous one against traffic and Compass laid on the rule for State drivers on the simple basis of safety. As mentioned to Betty, the dispatcher of the drivers in the GSA office, Compass does not want to die in Moscow and at no time, under no circumstances, shall any State driver make a U-Turn in front of JIC. I didn't lose my temper although they might (the Soviets) have thought that I did. I was planning on regular noon-time, and dinner-time observation of Turchanin St. It was all based on safety reasons and Compass will stick to his guns for he neither wants a smashup of a car nor does he want to be smashed up, because of a Soviet driver's carelessness - for convenience. They can wash cars all day long as far as Compass is concerned, and not sit on their "what do you call thems" in the chauffeurs' shack at the Embassy.



9. Compass is lost as far as what he has reported on JIC as a drop site so will repeat what he thinks is necessary. The wall intersection - which can be identified from the plans previously forwarded - with the house proper, has a two bulb light just at this point. Compass would trust no one to say that there was or there was not surveillance, but would instruct the man - CHALK - to be prepared to make a quick heave over a twelve foot wall as though he were throwing away a package of "dirty pictures" or a book he'd prefer not to be caught with. He should practice with snow balls over twelve feet walls before he tries JIC. (Compass is not ignoring but taking into consideration your advices re the use of JIC but has not the time to analyse them all. What is now being said includes consideration of your objections and guidance.) The dog situation, the lighting of the back yard, the access of the back yard, can all be handled by Compass on the basis of being sick with too much drink, interest in the dog, loneliness, and anything else that will take care of getting out in the backyard at the right time and with a good excuse. Plan on the wall. If CHALK buys it we will know soon enough. Anything that comes over the wall, except for a person which has not happened since Compass has been here, Compass has all the reasons he needs to get the package to himself.



10. There are many personality conflicts, inter-service rivalries, and housing problems here in the city, and at JIC which complicate rather than simplify the problem. Realising the absolute need, despite the personal problems, Compass hopes that what is sent here will enable you to make up a plan for CHALK. Compass is as anxious, and perhaps more so than those of you at home, that this will work out.

11. The position from which CHALK works, however, limits his social and representational opportunities. Thank the Lord for that. Otherwise, I'd probably not be able to control my social mobility as well as Compass has been able to do recently. Just give the instructions for time and place and Compass will be able - almost without exception - to comply.

12. Des, 10 - I will be spending [illegible] can find more in addition to that here [illegible] typewriter. Prospect work [illegible]

SUBJECT: The 1 May U-2 Incident and Powers' Fate

DATE OF INFO : May 1960 - Mid 1961

SOURCE : A reliable Soviet source (B) who was in an excellent position to acquire this information

Note: The following is an expansion of [redacted] of 30 November 1960. The informant of that report is the source of this one. 1.3(a)(4)

DO transcript info

1. When the U-2 flew over the USSR on 1 May 1960, there were only two V-75 surface-to air missile battalions in the Sverdlovsk area. /SR/Report note: This statement is false; there were more than two according to aerial photography./ They were on alert because of the holiday. When they received word that a hostile aircraft was flying overhead, both battalions opened fire and 14 missiles were launched. No direct hits were made.

2. The U-2, which was already being followed by a MIG-19, did not fly directly over the position of the zone of fire of either V-75 battalion. /SR/Report note: Is this relevant?/ Nevertheless, it was within the radius of explosion of one of the V-75 missiles.[1] As a result of this explosion, the U-2's tail and wing assembly were slightly damaged and the pilot, Powers, sustained a concussion.[2] While parachuting down, Powers blacked out several times, He was unconscious when he landed and when everything on his was seized. (According to DPD, this last sentence is not true.)

3/ Powers was brought to Moscow by plane, where he was met by KGB Chief Shelepin and an interpreter. They took him to Dzerzhinskiy Square, where he was fed and given medical treatment for his concussion. /SR/Report note: it was apparent from the trial that the KGB handled the case./

4. There was dissatisfaction in military circles that Powers was not turned over to the General Staff, since his flight was considered a military intrusion and his plane had been downed by a military unit. The GRU did not, however, become involved in the case.

5. Source expressed the opinion in mid-1961 that Powers would never be released except in an exchange. He suggested that an exchange with GRU officer

Igor Melekh might have been possible. [SR/Report note: Melekh left the U.S. on 8 April 1961, prior to source's comment.] [xxAccording to DPD, the concept of an exchange was being discussed between US and Soviet authorities prior to source's comments.]

1. Source Comment: Powers would have escaped if he had flown one or one and a half kilometers to the right of his flight path, not to the left.

2. Source Comment: The broken parts of the plane were not displayed at the Moscow exhibition.

The U-2 Incident of 1 May 1960

1.3(a)(4)

The following additional information from the informant of [redacted] of 30 November 1960 expands that report. Parts underlined in red appeared in the earlier report.

1. Two V-75 surface-to-air missile battalions in the Sverdlovsk area, on alert because of the holiday, opened fire and launched 14 missiles at the U-2 which flew overhead on 1 May 1960. No direct hits were made.

2. The U-2, which was already being followed by a MIG-19, did not fly directly over the position of the zone of fire of either V-75 battalion. Nevertheless, it was within the radius of explosion of one of the V-75 missiles.[1] As a result of this explosion, the U-2's tail and wing assembly were slightly damaged and the pilot, Powers, sustained a concussion.[2] While parachuting down, Powers blacked out several times. He was unconscious when he landed and when everything on him was seized.

Powers U

3. Powers was brought to Moscow by plane, where he was met by KGB Chief Shelepin and an interpreter. They took him to Dzerzhinskiy Square, where he was fed and given medical treatment for his concussion.

4. There was dissatisfaction in military circles that Powers was not turned over to the General Staff, since his flight was considered a military intrusion and his plane had been downed by a military unit. The GRU did not, however, become involved in the case.

5. Source expressed the opinion in mid-1961 that Powers would never be released except in an exchange. He suggested that an exchange with GRU officer Igor Melekh might have been possible. [Note: Melekh left the U. S. on 8 April 1961, prior to source's comment.]

6. On 5 May 1960, Khrushchev ordered a suspension of agent operations to avoid possible political ramifications. [Note: duration unknown.]

1. Source Comment: Powers would have escaped if he had flown one or one and a half kilometers to the right of his flight path, not to the left.

2. Source Comment: The broken parts of the plane were not displayed at the Moscow exhibition.

1.3(a)(4)

[redacted] OPERATIONAL PLAN

I. CASING OF DROP SITE

It is proposed that we brief [redacted] immediately, instructing him to case this area thoroughly. It is envisioned that [redacted] should first stroll past the drop site for external observations, and later, at an interval of several days, enter the site area and place a telephone call to a pre-arranged contact or absenteed Embassy acquaintance--whose absence has been previously ascertained. (See Annex I for detailed casing brief for [redacted] guidance.) 1.3(a)(4)

II. CASING OF SIGNAL SITE

After a thorough casing and examination of the proposed dead drop site, [redacted] should case the signal site proposed by [redacted] This casing can be done simultaneously with the casing of the dead drop site since it is believed that it is unnecessary to physically enter the signal site proper. In fact, the undersigned urges that [redacted] not enter the signal site area (to use the phone) for security reasons. A passing, external inspection should be sufficient. (See Annex III for signal site brief for [redacted] guidance.) 1.3(a)(4)

III. INTERNAL COMMUNICATION WITH [redacted] 1.3(a)(4)

A. Loading Pre-selected Drop

1. Upon receipt of [redacted] detailed casing information regarding site characteristics and [redacted] determination of [redacted] date of arrival in Helsinki, it isproposed that CSR/9 and/or the undersigned (or CSR/9's designee(s)) proceed to Helsinki for the purpose of briefing and further training [redacted] to put down the pre-selected drop. The actual drop will consist of acknowledgement of [redacted] first communication and a detailed plan designed to enable [redacted] to deposit additional materials in a drop selected and affording maximal control by CIA. (See outgoing communications from [redacted] 1.3(a)(4)

*See Annex II for [redacted] background. 1.3(a)(4)

APPROVED FOR RELEASE
31 MAR 1992

2. The drop packet and contents will be prepared at Headquarters and should be hermetically sealed (to deter opening by [redacted] as well as to protect the contents) and colored to match the dark green radiator drop site. CSR/9 will hand-carry the packet to Helsinki for transmittal to [redacted] 1.3(a)(4)

3. In Helsinki, [redacted] will be given intensive briefing on the general and specific locale, avenue(s) of approach, loading, security factors, aborting measures, possible entrapment including KGB M. O. against [redacted] if apprehended, use of telephone to call wife, exiting direction, and signalling technique and procedure. To give realism to the briefing, a building with foyer area, similar to the actual drop site, will attempted to be found in the Helsinki area and actual practice(s) will be performed. 1.3(a)(4)

4. [redacted] will then be given the packet to secrete upon himself as he returns to Moscow. (Note: [redacted] has a diplomatic passport and has previously reported that he has never been searched or asked to declare his personal items to Customs.) Upon arrival in Moscow, [redacted] will transfer the packet to his maximum security safe to which he alone has the key and combination. The safe is located in a secure building. (If preferred, the packet could be retained upon his body until the drop is effected.) 1.3(a)(4)

5. As soon as possible, [redacted] will make a dry run up Pushkinskaya Ulitsa for the purpose of external casing and orientation of the building drop site. At an interval of several days, he will make the actual drop preferably just before dusk, late in the day. It is suggested that consideration be given to [redacted] proceeding along Kuznetskiy Most, turning abruptly right onto Pushkinskaya Ulitsa, and, at his normal (fast) pace, proceeding directly into the drop site locale and emplacing the drop. An alternative method might be to proceed down Kuznetskiy Most and observe the window displays" in Meat Store No. 19, turning onto Pushkinskaya Ulitsa, (still window shopping in the Meat Store), pause and then proceed into the building site and place a call to his wife inquiring as to what kind of meat or kolbasa his wife prefers him to purchase. This would give him a convincing cover for the use of the phone, although his surveillants might be closer because he slowed down to window shop. 1.3(a)(4)

6. If, for any reason, [redacted] is obliged to abort the actual loading of the drop, then he should make, at this time, only one more attempt at an interval of approximately one week. If a second attempt must be made, [redacted] should use the alternate plan for approach and not the exact one as before. 1.3(a)(4)

7. After successful loading of the drop, [redacted] should allow at least one day to pass, but not more than two, before he puts down the pre-selected signal at the pre-designated site. On the basis of [redacted] casing report, [redacted] can proceed to this site and mark the loading signal with a red crayon or pen. 1.3(a)(4)

IV. OUTGOING COMMUNICATION FROM [redacted] 1.3(a)(4)

A. It is proposed that in our message to [redacted] that we inform him of the following method in which he may communicate with us: 1.3(a)(4)

1. [redacted] will be instructed that the American House, No. 3 KROPOTKINSKAYA NABERZHNAYA, will be the locale for the drop. He will be instructed to proceed down the right side of TURCHANIN Ulitsa (toward the Moscow River) at a specified date and time, and as he passes the wall surrounding the American House courtyard, throw the drop package over the wall. [redacted] will be in place on the otherside of the wall to retrieve the package. (See attached diagram and 1955 photos of this area - Annex IV.) 1.3(a)(4)

2. Upon receipt of package [redacted] will secrete it upon himself and return immediately to the Embassy for inclusion of package in pouch. NOTE: Dependent upon the circumstances and [redacted] recommendations, it may be more propitious to use the Marine NCO (highly recommended by [redacted] for actual transport of the drop packet to the Embassy. Thus, [redacted] could leave empty-handed and upon safe-arrival at the Embassy could telephone [redacted] at the American House. This would be the signal for [redacted] to instruct the Marine NCO to leave for the Embassy. However, such action might not be amenable to [redacted] without Ambassadorial knowledge and concurrence. 1.3(a)(4)

3. The afore-mentioned plan is contingent upon [redacted] casing of the area and his recommendations for implementing the plan. (A briefing guide is attached as Annex V for [redacted] guidance.) 1.3(a)(4)

ANNEX I

1. As soon as possible, [redacted] should take a stroll up the right-hand side of PUSHKINSKAYA Ulitsa (going toward SADOVAYA) and closely observe Building No. 2, situated between the Women's Shoe Store and Meat Store No. 19, located near the intersection of PUSHKINSKAYA Ulitsa and KUZNETSKIY MOST. (See Attachment No. 1 - map of area.) 1.3(a)(4)

2. During [redacted] walk-by and visual inspection of Building No. 2 and the immediate vicinity, the following detailed information is desired: 1.3(a)(4)

a. What type of building does No. 2 appear to be? Apartment-house, shop, restaurant, warehouse, etc.?

b. Would a Westerner be able to enter the ground floor to use the telephone without arousing undue attention?

c. Is the telephone booth visible when walking past the building?

d. Are there any windows flanking the entrance which would enable passersby to look into the lobby or foyer on the ground floor?

e. Was the presence of any type of possible fixed security forces noted in the immediate vicinity?

f. Note surveillance patterns on [redacted] in this area and the closeness of [redacted] surveillants, if possible (without arousing their suspicions). 1.3(a)(4)

g. Did [redacted] note any people transiting (entering or departing) or loitering in the lobby/foyer of Building No. 2 as [redacted] passed? 1.3(a)(4)

h. What type of building is located directly across the street from Building No. 2 with respect to its adaptability as an observation post?

NOTE: To facilitate [redacted] ability to observe the numerous items enumerated above, it is suggested that [redacted] pause at several stores along PUSHKINSKAYA Ulitsa to "window shop." In fact, 1.3(a)(4)

[redacted] might window shop at the [illegible] on the corner of PUSHKINSKAYA Ulitsa and KUZNETSKIY MOST (note location on attached map) and even enter and purchase a book. Upon exiting [redacted] could cross the street and window shop in Meat Store No. 19. With regard to the meat store, CIA would be interested in knowing if there is an entrance on KUZNETSKIY MOST as well as on PUSHKINSKAYA Ulitsa. Also what are the operating hours of the meat shop? 1.3(a)(4)

3. At an interval of several days, preferably at dusk, [redacted] should walk toward PUSHKINSKAYA Ulitsa past the PROEZD KHUDOZHESTVENNOGO TEATRA, turn right onto PUSHKINSKAYA Ulitsa and enter Building No. 2 and place a telephone call (telephone No. 28) to a friend in the Embassy. (This call should be pre-arranged to [redacted] or so arranged that [redacted] will know that the recipient of the call is not present to answer the call.) The location of the telephone is contained in the attached map and is situated to the left of the entrance. 1.3(a)(4)

4. The following detailed information is desired in conjunction with this casing/observation plan:

a. Surveillance: Number and pattern. Did any follow [redacted] into Building No. 2? Is it possible to enter Building No. 2 before the surveillance turns the corner? 1.3(a)(4)

b. Sketch and describe interior of foyer or lobby.

(1) Are there apt to be people loitering inside?

(2) Where are the stairs located?

(3) What color are the walls? Type of floor?

(4) What type of lighting is used in the lobby? How bright?

(5) Is phone booth illuminated?

(6) Note any other entrances or exits.

c. Particularly note dark green radiator near wall, opposite telephone booth, and to right of the entrance.

(1) Match green color as close as possible with colors from your chart. Is finish flat or shiny? New or old? Is it smooth or cracked and peeling.

(2) If [redacted] can determine a standard green available in Moscow, and visual observation confirms that this is the same shade of green as the radiator, he may possibly be able to duplicate it from Embassy stocks. 1.3(a)(4)

(3) It may be that the paint inside other Moscow building entrances is similar in color to that of the radiator site. Therefore, [redacted] may be able to get a sample, away from the site, after he has observed the radiator coloring. 1.3(a)(4)

(4) How high is radiator off of floor? Length?

(5) Note peculiar or distinguishing characteristics.

(6) What is the approximate distance between wall and back of radiator?

(7) What are the lighting conditions here?

(8) Is the hook visible? What color is the hook?

(9) Would a small packet, the color of the radiator, be visible to people entering or loitering in the foyer/ lobby?

(10) Are there knobs or dials for manual operation of the radiator?

(11) When will central heat be turned on in Moscow?

NOTE: In order to observe radiator area closely, [redacted] might, if he deems it secure, loiter just briefly near the radiator before exiting. [redacted] could be buttoning his coat, lighting a cigarette, blowing nose, etc.) 1.3(a)(4)

[redacted] 1.3(a)(4)

ANNEX II

The utilization of [redacted] in the project [redacted] presupposes that a risk assessment has been resolved in favor of using [redacted] instead of an unprotected American tourist. The involvement of [redacted] also is predicated on the fact that because of the prohibition on the use of American Embassy personnel, no active support can be rendered by CIA staff agents attached to the American Embassy, Moscow. The decision to use the services of [redacted] was based on the above premises plus the fact that [redacted] has diplomatic immunity, that he is trained in operational support tasks, capable, well motivated, and has already established operational patterns. Moreover, in case of a provocation, no American would be involved directly. On the debit side of the ledger, it should be noted that [redacted] is not CIA controlled (joint liaison operation), that he will probably render a full report of his operational involvement to his superiors, that [redacted] will become involved in this operation, and that [redacted] must be met in Helsinki in order to rehearse all steps of the plan and to give Subject the drop instrument.

1.3(a)(4)

[redacted]

1.3(a)(4)

ANNEX III

SIGNAL SITE CASING

1. Approach from Ulitsa GORKOGO going toward Ulitsa PUSHKINSKAYA via KOZITSKIY Pereulok. Walk on right side of street. Window-shop in vegetable-fruit store which is next to site (House 2, Korpus 8).

2. Determine type of installation where telephone is located.

3. Is telephone (and signal site) visible from sidewalk? Are there windows on ground floor level?

4. Would a Westerner have normal access in terms of using telephone or is telephone so hidden that passersby would never be aware of its existence? Are there any written signs or overt indications that there is a telephone booth in this location?

5. Observe any taxi stands or possible fixed surveillance/observation points near this building.

6. Notice if any people are loitering near entrance to building or situated across the street.

7. If you can observe interior through window or open door as you pass by, describe in detail interior arrangements.

8. Observe type of building(s) opposite (across the street) from signal site.

[redacted] 1.3(a)(4)

4. The advantages of this type of outgoing communication from [redacted] is that, if this operation is being mounted by the KGB as a provocation, it puts the opposition in an extremely difficult position in terms of making a positive identification of [redacted] and of physically apprehending him. Thus it affords CIA stricter control of the drop and area than heretofore has been possible for internal drop unloading. 1.3(a)(4)

5. It is proposed that [redacted] be informed that "our man" will be available, i.e., waiting on the other side of the wall, precisely at 2300 hours (e.g.) on each Saturday for four concurrent weeks. "Our man" will be instructed to be in place at 2255 and remain in place until circa 2305. In the event that something is amiss, "our man" will give a danger signal, e.g., sing or whistle a familiar tune. Moreover, a precise spot along the wall will be located for [redacted] to throw the packet. 1.3(a)(4)

6. [redacted] will have the option of aborting the proposed action as he passes the drop spot. If the operation is clean, [redacted] only security worry will be the presence and/or location of Soviet citizens in the imme diate area. However, in the past, this street has been dimly lit and not subject to heavy pedestrian traffic. 1.3(a)(4)

7. Exact details and timing will be worked out upon approval of this operational plan by CSR/9 and the casing and recommendations of [redacted] 1.3(a)(4)

[redacted] 1.3(a)(4)

SR/9

[redacted] 1.3(a)(4)

[redacted] Compass had written a report concerning certain [redacted] and maintenance problems with an agent [redacted] true, but undiplomatic, since it [redacted] our official inefficiency was in no [redacted] variance with our direction of our work.

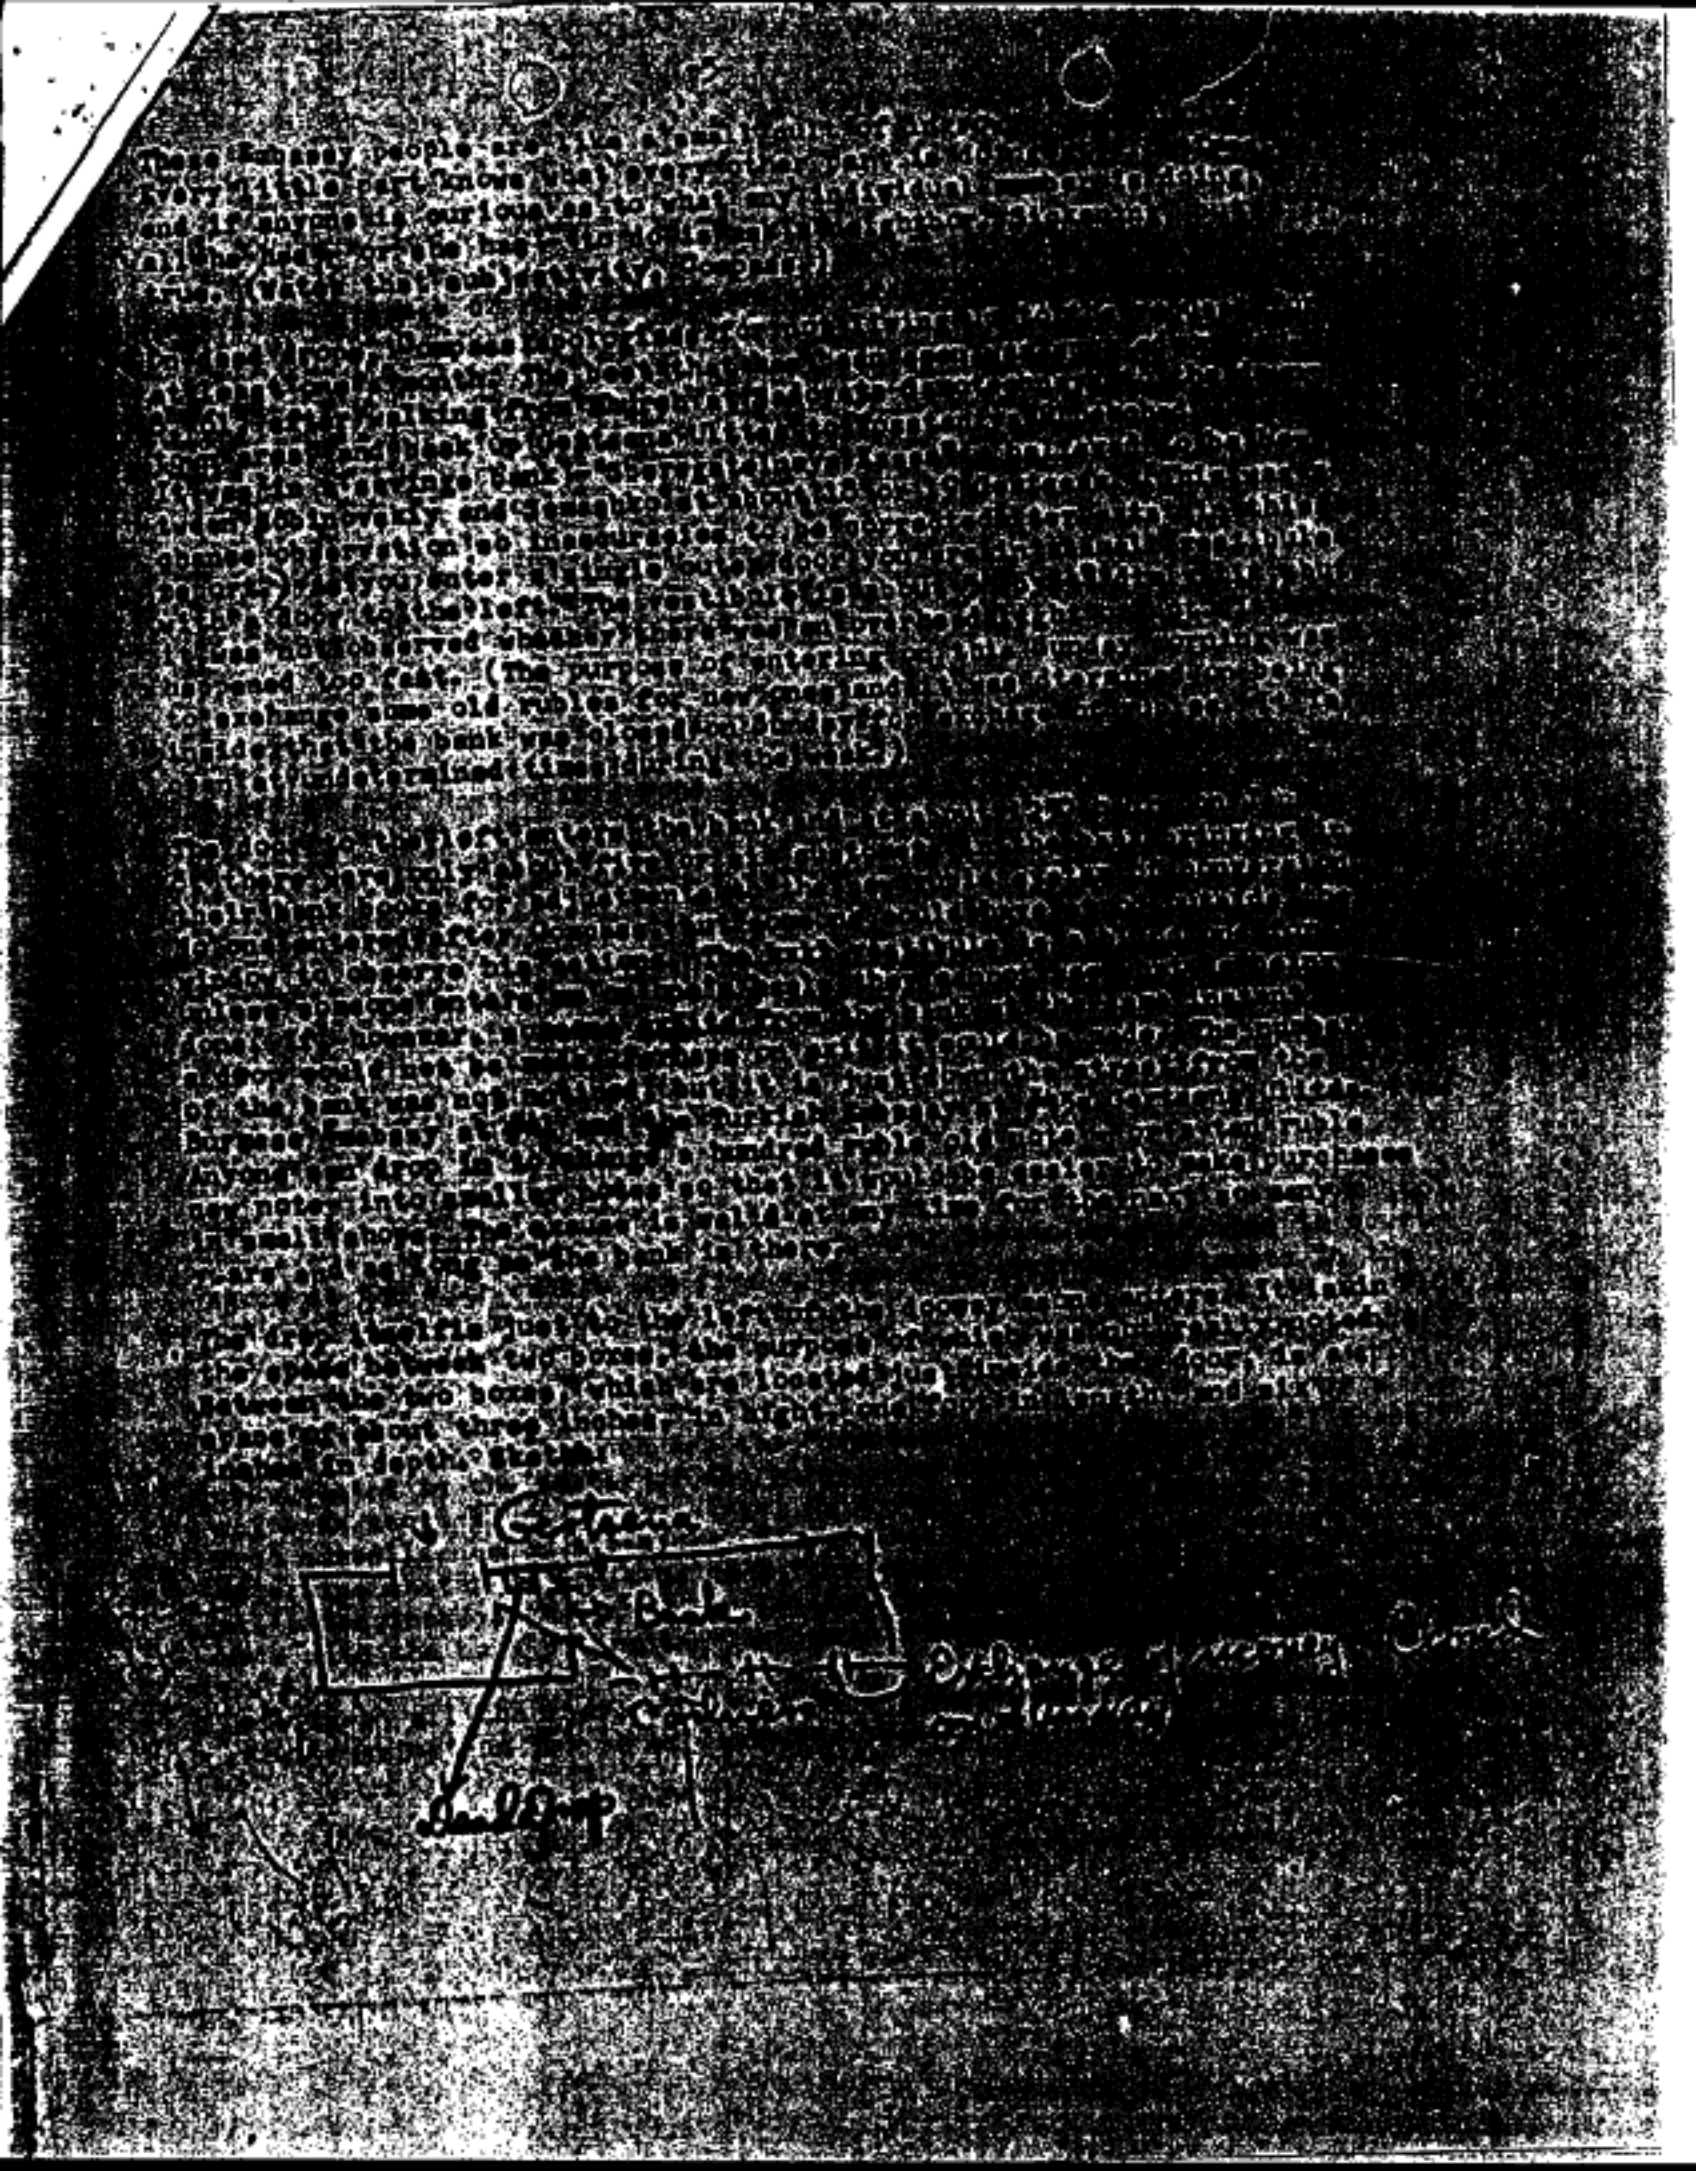
[redacted] detail of little importance, which Compass hopes has been re- [redacted] It did bring to Jones attention that he has been emotional in [redacted] reporting to you as well. The only excuse is that one has to let out [redacted] somewhere, but Compass is now impressed that he cannot afford such out- [redacted] of immaturity. If Compass were not considered an adult he would not [redacted], so he will try to at least act like an adult.

[redacted] problem of organization of letters referred to earlier in previous reports still [redacted] up the burden of organization will still have to remain with you.

Most recent information of importance concerning the JIB drop site is that [redacted] lights reported to exist at the edge of the river at the end of Turbanin street have been removed. They were double globe lights which were reported as being extinguished at midnight every night. They are gone completely. Compass regrets that he can not report when they were removed, their absence was first noted on Jan. 27, 60.

[redacted] double globe lights at the intersection of the JIB with the wall on Turbanin St. are still there and a check made at 2145 tonight indicated that with the snow cover on the ground, the dog pen is brightly illuminated from these lights.

A second double globe lamp is about fifty feet up the street from the light at JIB and wall intersection on Turbanin, and helps illuminate the area.



One of the military in the house mentioned that there must be a military installation on Frumenskaya Naberezhnaya since so many military seem to be on the busses and walking the streets in that direction. Compass has noted a fair amount of military officers walking from the bus stops and the Krimskiy Most Metro area, so believes that Chalk in or out of uniform should have no difficulty being in the area.

For the times contemplated and ignoring the dog problem, Compass can promise that he will be waiting for any packages coming over the wall on a Saturday night, on any Saturday night. Compass has managed over the past three months to establish both a pattern of social compatability and a pattern of independent action which should give him the required freedom to be anywhere required at any time, except awkward hours like these in the morning when very few people are afoot and it is unlikely that Chalk can be free to wander. If, however, such off-schedule hour wanderings are desired, they can be worked into Compass' independent desires. For instance, in any other city in the world Compass would wander at any time of the day or night, and while it is a mite unusual here, why not, if it is needed.

The problem with the dog, implied in the preceding paragraph, is that he has become an unmanageable beast of some 45 pounds with no discipline.

(9)

MEETING #1 (LONDON), 20 APRIL 1961

1. The meeting was held at the Mount Royal Hotel. Participants in the meeting were:

Harold Hazlewood
Michael Fairfield
Joseph Walk
George McAdam

2. By means of a prearranged meeting set up through Mr. Greville WYNNE as organized by Mr. [redacted] (details of which are recorded elsewhere), Subject was expected at any time convenient for him to take leave of his companions under the pretext of turning in for the night. This was expected to occur at any time after 2100 hours. Subject's instructions were to report to Room 712 which was engaged by Mr. Hazlewood. Since Room 360 appeared to be far superior as a meeting place because it was much larger, with adequate seating capacity and, more important, it was an interior court thus avoiding street noises and in addition since a clandestine recorder could be more conveniently concealed in this room, it was decided to use Room 361. Mr. HAZLEWOOD, hereafter referred to as H. and Mr. [redacted], hereafter referred to as J., waited for the arrival of Subject in Room 712 for the purpose of escorting him to Room 360 where the other two members of the party waited. Subject arrived at Room 712 at about 2140 hours and after being greeted by H. and J. was told that a more adequate meeting area was set up in Room 360, to which room Subject was conducted. Subject arrived in Room 360 at 2150 hours. Upon entering Subject was introduced to G. and H. and all persons sat in a circle with a small serving table in the middle.

3. G: Would you prefer to speak Russian or English? S: I would much rather speak Russian because I can express myself much better in Russian. G: Very well, then. S: I graduated from the Military-Diplomatic Academy in 1953. In 1955 I went to Turkey. My working language there was English. I had many difficulties there and during the past four years I simply forgot much of my English by disuse. Well, Gentlemen, let's get to work. We have a great deal of important work to do. G: You have already introduced yourselves upstairs. S: Yes. G: Therefore you know now that you are in good hands. S: Yes, and I have thought about this for a long time and I have attempted to make this contact taking a very devious path about which I feel I must report to you in full. G: You must know that we are in receipt of your original letter. S: You mean the one I gave to the two teachers (the two American tourists). If you knew how many grey hairs I have acquired since that time; if you had only marked the signal just so I would have known that the message got into the proper hands. I worried so much about this. (To reassure Subject J. pulled out the original copy of Subject's first letter referred to above including the photograph he enclosed of Colonel Charles PEEKE, U.S. Military Attache, Ankara, at the time Subject served his tour there.) S: Yes, that is the photograph I sent and Colonel PEEKE was the Military Attache there. G: This was shown you to reassure you and in two words I can tell you why a response was not made to you immediately after

APPROVED FOR RELEASE

[redacted]

[redacted]

receiving the letter. We deliberately delayed signalling you [illegible] a secure manner for a receipt of the materials you wanted to pass could [illegible]devised. This was done exclusively in consideration of your security. S: And, between friends, admit that you did not trust me. That is the most unpleasant and painful to me. G: No, it is quite the opposite.

4. S: I was exposing myself constantly to considerable danger. I was walking all around the American Embassy, but I will tell you all about that in detail later; thoughts are just jumping into my mind. I had expected to be met by an American representative - why do I say American? Because a good friend of mine was the Military Attache in Turkey, Colonel Charles PEEKE, and I also have many other American acquaintances among whom were the Naval and Air Attaches. On the British side I knew only the Brigadier who was the Military Attache and his Assistant. Due to this friendship I wanted to arrange with Colonel PEEKE some sort of a future plan that I already had in my mind but unfortunately just prior to my departure the mother of Colonel PEEKE's wife died and he and his wife flew to America for the funeral. Since he left I did not want to speak to any of the other attaches with whom I was not as well acquainted -- for example the Air Attache had only recently arrived and I did not know him too well -- and in addition when I left Turkey I expected to return. I thought I was going on leave but they held me up in Moscow and did not send me back. "They deceived me."

[redacted]

6. G: We know about this. Did you receive a telephone call (in Moscow)? S: Yes, I did, but this gave me absolutely nothing at all; I did not understand anything. The only word I understood in the whole message was the word "March". In a telephone conversation I do not understand English at all. Therefore, I requested that when a telephone call was to be made, that it be made in Russian. In addition the call should be made from a public booth. G: It was. S: The night before I was at a friend's house at a party and the following morning when the telephone rang I thought it was from him. My control time for the call was at 10.00 hours and the call came at 11.00 hours. G: That is correct. S: I understood nothing and I couldn't ask questions very well since my wife waswalking around. In addition, my mother and daughter

[redacted]

also in the room. Although they realise that I can speak English, to ...ge in a serious-type conversation would raise the question as to with ...om I am speaking. G: Is your wife absolutely unwitting of your intentions? S: No, she doesn't know a thing. I will tell you exactly who knows anything about it later. (This is in reference to the numerous contacts subject made, of which we are aware).

7. (Subject now begins his biography.) S: I was born in 1919 in the Caucasus. My father was a paruchik (First Lieutenant in the Czar's Army). My father's name was Vladimir FLORIANOVICH. My grandfather came from Stavropol -- maybe you would like to jot down some of this data since it would be hard to remember everything. (Notes were taken by all parties at least for the sake of appearances since Subject was unaware that the conversation was going to be recorded. Normal note taking was completely out of the question since Subject's manner of speaking was in a rapid-fire manner often jumping from subject to subject in incomplete thoughts. It had been previously decided to permit Subject to unburden himself in any way he was disposed to during this first meeting.) My grandfather's name was Florian ANTONOVICH and he was a well known jurist in Stavropol. Only recently I have been accused and confronted with having come from a background of nobility (dvoryanstvo). Allegedly this information came from one of the countries of People's Democracies. My mother brought me up alone -- I was the only son. My father had graduated from a Polytechnic Institute and he was a mining engineer and then he disappeared without a trace. Either he died of illness or was shot during the Revolutionary days since there were very violent conflicts in that district of the Caucasus. The town was formerly known as Vladikavkas. It is a tri-lingual city; its Ossetian name is [redacted] and now it is called Ordzhonikidse (later renamed again To STAVROPOL) → DZHAUDZIKAU

8. Well, both my grandfathers died; my mother brought me up alone. I finished ten year classes and immediately enrolled in the Second Kiev Artillery School. Since my father had vanished without trace it is not possible to state so simply in one's official records in the Soviet Union. One simply would be blocked for life from progressing in any speciality. They would not accept one in the Party and one would just about be a common laborer. Therefore, I worked out a legend that he had been killed in 1919. Actually we did find out from records later, and my mother knows this -- she is living with me now, -- that he was killed during the siege of Rostov and that he had been promoted to First Lieutenant in May 1919 -- Officer in the White Army. So everything was accepted and I had no difficulty. In my early years I decided I had better keep myself with enthusiasm to the Communist cause and, to be perfectly honest, I did serve quite faithfully. I am almost forty-two now -- in fact on the 23rd April will be my forty-second birthday -- that is this coming Sunday. G: We'll celebrate it. S: Thank you.

9. I joined the Komsomols and I considered myself a progressive young man of our country fighting for the idea of Lenin. My ambition then was to join the Party and in 1939 I was already a candidate for Party membership. Also in 1939, I graduated from the Kiev Artillery School. Immediately upon graduation I was taken for a twenty-day assignment to liberate the Western Ukraine and our action was in the direction Tarnopol - Lvov (at that time Poland).

[redacted]

that is between Novosibirsk and Krasnoyarsk on River Chulym

Politruk batarei
(Political commissar of battery)

At that time the Yezhovshchina (popular expression for the extreme NKVD purges in 1939) was acting in full force and there were many executions even of Army people. Since I was a Party candidate I was assigned, together with a lot of other candidates, to serve as a political Commissar (Politrobotnik) with various Army units. I worked in that capacity for four years. My rank was Senior Politruk. There was little loss of life in this campaign in Poland. This was in September and October 1939 and we were engaged in liberating Belorussia and the Western Ukraine. G: This was Polish territory. S: Yes it was, but we were liberating it, just as the Red Army liberated the Baltic states. At that time I was on what was known as the First Western Front.

10. G: Where did these troops come from? S: Primarily from Kiev, but also from other military districts. They were regular Soviet Army units which were engaged in occupation operations. Our Front occupied the territories including Lvov and then there was established a line of demarcation (with the Hitler occupation forces). I have been a cadre officer since 1939, upon my graduation from the Kiev Artillery School, and have served in the Army since 1937. After this operation I was transferred together with a number of my fellow officer to Achinsk which is near Novosibirsk. The 91st Rifle Division was deployed there and I was transferred to it. I was assigned the duty of working as a political worker in a battery. In December 1939, the war with the Finns began and in January 1940, our Division was sent into action on the Karelian Isthmus against the Finns. The Division was in reserve almost all the time, but two days prior to the arrival of KALININ -- who was to participate in the Peace Treaty -- our Division was thrown into action and only 10% of the strength survived. All regimental commanders were killed and I was fortunate to escape without a scratch. This was due to the fact that I was an artilleryman and our positions are somewhat behind the front line. Despite the hardships of weather and this conflict I was still full of enthusiasm and, as this war ended, I was accepted into the Party in March 1940. I am very glad that you have my original letter. My spirits have been buoyed up considerably and I am no longer tired.

11. G: Let me ask this brief question. Please tell us now how much time you have at your disposal? Can you get into any trouble for being away? S: I have received a special Intelligence mission during this trip now. I can leave at any time to do my own work and I will tell you later what my mission is. The other members of the Party realize that I am not an engineer or a specialist and that I am a member of this delegation because I work in the foreign relations section of the Committee (G.N.T.K.). They know that many Intelligence personnel work in this Committee and in fact in all ministries. All I need to say is that I want to go off. G: We ask you this out of consideration for your personal security. For example, if it is alright for you to go for a walk tomorrow you cannot again say, "I went out for a walk". We'd like to meet with you often but not every other five minutes. S: That's right. I would say that today I have about two hours' time. G: In addition, since you have a heavy beginning with tomorrow morning and are also tired from the trip today, you should have some sleep. S: If anyone calls me on the phone I will simply say I was tired and had disconnected the phone and did not hear it. I simply said "Good night" to the other

fellows and went to sleep. That's all there is to it. G: At any rate you must be on your guard constantly and it is difficult for us to determine what is dangerous for you and what is not. S: Yes, I have asked you to protect me and I will also protect myself. G: Enough dangerous risks have been taken by you already and by the grace of God everything turned out alright. Therefore, that is all the more reason for being extra careful now. S: Yes, after all the chances thank God everything turned out alright and thank you for your consideration.

12. S: After I became a Party member and the war with Finland was over, I was transferred to the Moscow Military district. My assignment there was Deputy to the Chief of the Political Section dealing with Komsomols in the Artillary School imeni [redacted] Later I will give you my complete autobiography in full chronological order as it should be done. I worked there until the beginning of World War II. I received a small room and brought my mother there. Previously my mother also had a room in Ordzhonikidze but we had to sell out there and lost everything. When the war began I was transferred to the Headquarters of the Moscow Military district. There I worked as a senior instructor in the Political Directorate of the Moscow Military District and again this involved work with the Komsomols. I was still full of enthusiasm and was already a senior Politbuk and I was twenty-three years of age then. After one year I was transferred to the Military Council of the Moscow Military District in the section for Extraordinary Missions. At that time the Commander of the District was ARTEMIEV and he is now working in Sverdlovsk as the Deputy Commander. He had some previous difficulties -- his full name is Pavel Artemievich ARTEMIEV.

Artemiev Sverdlovsk NKD

13. The member of the Military Council was GAPANOVICH, Dmitri Afanasyevich, a Lieutenant General whose daughter I married and to whom I am married today. He died in 1952. I have been married now for fifteen years. G: What was exactly his position? S: He was a member of the Military Council of the Moscow Military District. He was a prominent political worker and at one time he wore three rhombs. He died as a Lieutenant General -- two stars. He is buried in Moscow in the German cemetry. He was a very fine man; he helped me a great deal and he liked me. He saw that I was very enthusiastic, which was quite true at that time, and I do not deny this to you. I only make this remark now to explain why later I changed all my views and how I became more mature in my thinking.

14. I worked there until November of 1943. At that time the recapture of Kiev was being celebrated and I thought that the war would end very soon. Here I was with no distinctions or decorations. I received nothing for the Finnish campaign, only a commendation and a cigarette case. There were already a thousand Heroes of the Soviet Union so I submitted a request for front line duty and was sent to the First Ukrainian Front. I was assigned to a subdivision of this huge headquarters by VARENTSOV, Sergei Sergeyevich, a General who is now a Marshal. Note his name; I will tell you much about him

Krasinn

I was St. Soldiers

[redacted]

later. He was at that time a Gen. Polk. (Colonel-General) of Artillery and was the Chief of the Artillery of the First Ukrainian Front. He liked me since I was full of enthusiasm and assigned me as the Commander of a training reception center for anti-tank artillery regiments. At that time we had twenty-seven anti-tank artillery regiments in action on the First Ukrainian Front combatting German tanks. Therefore the General gave me this assignment emphasizing how important it was to have a constant flow of replacement units to the front.

15. Later on when I'd like to mention our mutual future missions I will come back to this point. One of Hitler's greatest mistakes was that the eighteen mobilization and training centers in the USSR were never destroyed. These centers continuously fed millions of replacements to the front lines of the Soviet Army. These were all the mobilization and organizational direction units and it is the very soul of the Army. They control not only manpower but also all sorts of equipment and supplies. German bombing was disorganized, and pointless small diversionist groups could easily have destroyed these centers and paralized the Soviet Army, but we'll come back to that later. Primarily my work there was to reorganize heavily depleted anti-tank regiments. In intensive combat the life of such a regiment was often only one or two hours since the Germans launched many mass tank attacks. These depleted units were filled out and re-equipped by an abundant and constant flow of tanks and guns from factories in the Urals which Hitler neglected to destroy and which still maintained supply despite extensive food shortages on the part of the factory workers and the population. This was a fundamental error and I will discuss this further when we consider what must be done in the future.

16. In my assignment I had three training units one each in Kiev, Belaya Tserkov and Zhitomir. Regiments were re-equipped at these points and returned to front line duty. I worked there for three months and wanted to go on line duty and submitted a request. I was assigned as a deputy to a regimental commander for personnel matters. At this point my service as a political worker ended and I was again a line officer. I worked two months in this capacity under my commander, a Hero of the Soviet Union named TIKVICH. He was a good fellow but he was a drunkard. He assaulted a woman and was removed, so I became the Commander of the 323rd Artillery Anti-Tank Regiment of the Eighth Artillery Anti-Tank Brigade. The Brigade consisted of the 322nd, 323rd, and 324th Regiments. The Commander of the Brigade was CHELALAK, also a Hero of the Soviet Union, who died recently in Voronezh. Then I was wounded and was sent to Moscow in June 1944. I met many friends there and at that time the Military Council of the Moscow Military District included BERIA, PRONIN, who was then deputy of the Council of Workers of Moscow, [illegible], and my father-in-law, GAFANOVICH, as well as all the chiefs of the arms and services. This military district organization was at that time the most important one because it also controlled the Headquarters for the defense of Moscow. This defense included thirteen defensive rings extended from the Kremlin to Mozhaisk. These were organized after the Germans were thrown back. These circles were organized into strong points and later when they were transformed into divisions they were sent forward to the front lines.

17. S: I was hospitalized for two months, released, and prepared to return to the front. I was the youngest regimental commander on the front at that time. I then had two decorations; now I have, altogether, five orders and eight medals. G: What rank were you at that time? S: I was a Major at that time. Just as I was about to go to the front I heard that General VARENTSOV, who was en route to visit General KONEV, was injured in a tank accident and was flown to Moscow and placed in a so-called Marshals' Hospital on the Serebryannyy Pereulok. His hip was damaged and as a result one foot was shorter than the other. He was suspended by a pulley in a hospital for four months. Since he was my commanding officer I brought gifts to him. He already knew me well and he assigned me to be his liaison officer from him to the front. He wanted me to do this during his recuperation and said that then we would go back to the front together and he would give me back my old regiment. I told him that that would be fine and since the war would end soon and the Germans would be crushed, I would like to go to a Military Academy. He said he would arrange this. I went back and forth to the front a number of times and reported to him.

18. S: At this time his wife, mother and his two daughters were already in Lvov. On Pushkin Street during the time the Marshal was hospitalized, they had a hard time getting food and fuel. Therefore, I took care of the family since not only was the Marshal a very nice person but I knew that he would reward me tenfold for anything I did for him. The Marshal had been married once before and from that marriage he had a daughter, Nina. She committed suicide at the time the Marshal was hospitalized because her husband, who happened to be a Jew named LASHAK, and with whom she was deeply in love, was shot for participating in a black market ring. I sold my last watch and went down to Lvov to bury the girl, purchasing a black dress and her coffin. After I returned to the front with the Marshal and he knew what I had done, he said, "You are like a son to me."

19. S: Up to this very time he supports me, and it is partially due to him that I am sitting with you now since as of yesterday he was still hesitating to send me here. Although I had my visa from you on the 8th of April, they were still undecided in the Central Committee yesterday as to whether I should be sent or not. This is because my father was a White officer. On the other hand I have had a distinguished military record in three campaigns, have been decorated and have no black marks whatsoever on my Party records. If I were not to be sent for the reason of my father, I should be isolated anyway. In fact, I once was because I was slated to go to India as the Military Attache and was not permitted to go even though I was completely prepared to go. I will tell you more about that later. They did not let me go and transferred me instead to another section, namely, this Committee. Of course, the work is along the line of Intelligence, but of a more passive variety, namely, to work with foreign delegations, the purpose being to obtain information -- possibly to steal some documents of value, and, of course, the ever-present mission of recruiting someone in a foreign delegation. At any rate this latter mission thus far has been unsuccessful as far as I am concerned.

20. G: For which organization do you execute this mission-the NKVD? S: No, the GRU. I am an officer of Strategic Intelligence of the General Staff. G: Even up to now? S: Yes. They had no cause to shoot me or to

[redacted]

arrest me. About a year ago I was called up by the Chief of the Personnel Directorate who questioned me about my father. He said, "This is what you have declared your background to be and this is what we have found out about your father. You said your father simply died." I replied, "I have never seen my father and never received a piece of bread from him." The General said, "But evidently you have concealed the fact." To which I replied, "If I had something to conceal I had a tenfold opportunity to run off during the war or on my assignment abroad in Turkey, and I did not do this. I was even in all of the countries of the Peoples' Democracies." G: Who was this Personnel Chief? S: The Chief of the Cadre Directorate is Gen. Leit SMOLIKOV and his Deputy is Gen. Major SHUMSKIY. The Chief of the GRU is General SEROV who was previously the Chief of the KGB. They asked me how long my length of service was and I said twenty-four years and in 1962 I will complete my twenty-five years of service. If I had already completed my 25 years they would have discharged me because for them I am politically unreliable. That is what I feel. Up to a certain degree they trust me, but they watch me closely. I believe they actually trust me because about a year and a half ago before they unearthed anything about my father they sent me to higher academic courses on new technology. It is from there that I wrote up all this material on rockets. In my opinion, had they already known about my father they would not have sent me there. However, they did not permit me to go to India even though I had prepared myself completely and had studied all the required codes and ciphers since I was to have gone as the REZIDENT.

21. S: Well, anyway, when VARENTSOV returned to the front at the request of KOREV I also went along and was given the command of another regiment, the 51st Artillery Anti-Tank Regiment, a G.H.Q. unit. This regiment was independent and not part of the Brigade; it belonged to the First Ukrainian Front. I commanded this regiment until the war ended. At the end of the war I wanted to go to an Academy but he asked me to work with him for a year with the occupation troops. At that time the Headquarters was in Baden, Austria. It was the Headquarters of the Central Group of Forces. I requested VARENTSOV to release me, saying that my bride, Vera, is in Moscow and has just graduated from the tenth class. At that time I had sub-let two rooms in Moscow which I had then changed for an apartment in which I have been living for the past fifteen years. G: Where is this apartment? S: It is on the NABERE ZHNAYA GORKOVA. It is about a two-minute walk from the Headquarters of the Moscow Military District, but I work at the General Staff on the Arbat. The General said "Go ahead".

22. S: I arrived two months after the courses began, but I passed the examination successfully and was admitted. Since I had commanded a regiment, I had no trouble passing a battalion commander's examination. So I entered and in 1948, I graduated from the Frunze Academy. Immediately upon graduation from the Frunze Academy I was offered the opportunity of entering the Military-Diplomatic Academy to study Strategic Intelligence. G: How long were you in Frunze? S: It was a three-year course. I consulted my father-in-law, General GAPANOVICH, who advised me to work for a year instead of transferring from one classroom to another at once. So I worked for one year in two places. My first assignment was as a senior officer in the

[redacted]

[redacted]

Mobilization and Organization Directorate of the Headquarters of the Moscow Military District, where I had previously worked in a lower capacity. I worked there for six months and then I was transferred to the Headquarters of the Ground Forces. I was also there as a senior officer and was perfectly satisfied with the job, since it paid 200 rubles a month more. But I did have in mind to enter the MDA in 1949 and fortunately we have a regulation which says that the pay of an officer received just prior to entering the MDA is retained by that officer during the period that he is a student. Therefore in 1949 I was accepted at the MDA which is near the subway station SOKOL. G: Is it not 13 Peschannaya Street? S: That's exactly right and I need not say any more about that.

23. S: I studied there for four years from 1949-1953. It was then a four-year course but now it has been reduced to a three-year course. The Chief of the School is Gen. Leit KHLOPOV. He is a Gen. Leit. of Tank Forces and had previously been an Intelligence officer. I don't remember his name and patronymic at the moment. Prior to this assignment he had been the Chief of the Information Directorate of the GRU. There are six directorates in the GRU, in addition to the Information Directorate, but we will come back to that later. The reason he was given this appointment was because two predecessors died -- one was Gen. SLAVIN, who was a Military Attache to one of the Scandinavian countries, I believe Sweden, and the other was Gen BRADVIN who returned from Germany. He was at GRU at the time I graduated and was the one who signed my diploma.

24. G: Wasn't KOCHETKOV there also? S: KOCHETKOV was the Deputy Chief. He was also a Lieutenant General. He was the chief instructor of the Scientific Research Department and I believe he was then a Gen. Maior. At that time there were 98 students in the class and now there are only sixty. As I reported to you in the data I passed. I will tell you how I got this information. At that time I was working there as the chief of a class, but they also removed me from there when they assigned me to my present position. I was in charge of selecting students for the class as well as being chief of the class. G: Isn't that a General's T/O slot? S: Yes, it is, but here I am already walking around eleven years and a full Colonel. I attempted to have WINNE photograph all these documents, my various passes, my Party card etc. since these had to be left behind, but he simply said he was afraid.

25. S: After graduation I was placed in the Fourth Directorate of the GRU. This Directorate is the Eastern Directorate (Strategic Intelligence). There are other Directorates, for example the Anglo-American Directorate, the European Directorate and the First Directorate which is the Directorate for Illegals under Vice-Admiral BYKHENEV, about whom you probably know. We will come to all these Directorates later. Anyway I worked there for about a year on the Egyptian desk. I became familiar with the agent nets there and remember something about it yet. At that time the leader of Egypt was NASSER's predecessor who was Brigadier NAGUIB. General Maior KISLENKO, who was the Director in Chief, called me in. KISLENKO had previously been in Japan. At this time KISLENKO is still living, but he had been discharged. G: Does the Eastern Directorate include the Far East as well as the Near East? S: It includes everything -- at le at that time it did. I'll tell you what the new organization is later but at that time it included the Near East, Middle East and Far East. His Deputy at that time, whom I remember well, was Nikolay Mikhaylovich SOKOLOV who went under cover

[redacted]

somewhere to the Near East. G: What is KISLENKO's name and patronymic? S: I don't remember.

26. G: Can you list me all of the other directorates of the GRU? S: The former structure or the present structure? G: The present structure. S: I will describe that all to you in detail later. General KISLENKO told me that they wanted to send me to Pakistan as the Senior Assistant to the REZIDENT. The Military Attache, who was REZIDENT, was my instructor at MDA -- his name slips my mind at the moment. I must be getting tired. Anyway I agreed to go, but when all my documents were prepared the Pakistani Government refused to grant me a visa. Another Assistant, a Lieutenant Colonel, also had his visa refused. Oh yes, the Colonel's name was DUBROVIN. The reason given for refusing the visas was that it was undesirable to expand the size of the Military Attache's office there. I will be remembering things from time to time, please forgive me for not being so alert since I have been so nervous. The visa was refused even though my appointment there was already signed off by VASILYEVSKIY. Therefore, I could not go and neither could the other assistant. DUBROVIN sat there all by himself with just his code clerk. and wife

27. S: I continued to work another several months on the Egyptian desk and KISLENKO called me up again and said, "We are thinking of sending you to Turkey". This was already at the end of 1954. Again I prepared myself to go and studied codes, the operational program, the economics of the country, the armed forces etc.. At that time a Military Attache in Turkey was Colonel KONDRASHEV. He is a little fellow who was an engineer. He is now working as an instructor in the MDA in the Area Studies Department. He had been in Turkey a long time - five years - but things were not going well for him. There were no REZIDENTURAS there and even now there is insignificant activity there. It was difficult to recruit Turks. Right now they bring in people from a third country for contact with the REZIDENTURAS in Turkey. I arrived in July of 1955 and became the REZIDENT. My official position was acting Military Attache and I took over the whole agent operation net. G: What rank did you hold - Lieutenant Colonel or Colonel? S: I was already a Colonel - let me clarify this. At the end of the war just prior to my entry to the Frunze Academy I was promoted to Lieutenant Colonel and I was promoted to full Colonel in February 1950. I was already walking about eleven years as a full Colonel in February 1950, and they will never make me a General. They have already said so and they have said I was unreliable. (Jokingly) Maybe I will become a General in another army.

28. S: So I arrived in Turkey with my wife and took over the REZIDENTURA. During the course of one month KONDRASHEV turned over all the responsibilities to me and I had for my assistant CHICHERIN, the Naval Attache, and at that time there was no Air Attache. There was an assistant, YERIN, who was concerned with air matters although he was not the Air Attache. SEVEN ~~Five~~ months later Gen. Maior SAVCHENKO arrived, but he arrived under the false name of RUBENKO. Many of our people use false names; for example, the Scientific and Technical Adviser to the Ambassador in Japan is a Colonel SERGEYEV but that is not his real name. I don't remember his real name now. G: Do you remember General RUZANKOV? S: Yes, I know him. G: His real name is

[redacted]

ROSHCHIN. S: That's right.

29. S: This SAVCHENKO was previously Military Attache in Afghanistan. This old man arrived; he was over sixty years of age. I turned over everything to him and he became the REZIDENT and I became his assistant. I worked until November 1956 and then we had a compromise. This took place three months after SAVCHENKO's arrival and it referred to Lieutenant Colonel Nikolay IONCHENKO. He was simply approaching Turks in restaurants and offering them money to work for him. S: IONCHENKO was attempting to purchase military manuals from Turks in this crude manner. Naturally the Turkish Counterintelligence was efficient and they noticed this. Now I will confess to you the following: My relations with the General and with IONCHENKO were extremely bad; they were trying to undermine me along Party lines. I will tell you the details of this later. (Note: This is a most salient theme in Subject's recent life and has contributed significantly to his decision to approach the West. Specifically it involves his life-long legend that his father had died of typhus in 1919. Actually his father was killed while fighting with the White Army against the Reds as a First Lieutenant in the City of Rostov. The significance of the fact lies in a KGB accusation that Subject had deliberately concealed the true circumstances and this accusation was a matter of record in his GRU file). I made an anonymous telephone call from a public booth to the Turkish Counterintelligence informing them of IONCHENKO's activities and specifying where his agent contacts were made. G: What was his rank? S: He was a Lieutenant Colonel; his first name is Nikolay.

30. [redacted] IONCHENKO was very bitter against me. Since he had [redacted] STUDIED the Turkish language at the Academy he was indignant that I with the English language was sent out to be the senior deputy to the REZIDENT instead of himself. He was very friendly with the General and they had become good friends in Moscow; both arrived in January 1956. They both were dead set against me and made my life so miserable that I wrote a letter to Headquarters requesting a transfer - anywhere. They replied that I should wait. By nature I am a vengeful person but at least on a basis of fairness. Even then when I saw how unjustly I was being treated I had already decided to come over to you. I want to take oath and to sign my willingness to serve you and spend the rest of my days, whatever they may be, in a new life.

31. S: Three months later IONCHENKO was compromised and was declared Persona Non Grata and I accompanied him through Istanbul and he went homevia Bulgaria. The General wrote a cable to Headquarters stating that the Turks and the Americans ran a provocation against IONCHENKO and while he was purchasing fruit he was seized. Incidentally, at this time the Shah and his wife were on an official visit and Turkish security and Counterintelligence services were intensively alert in protecting the visitors. We even had instructions from the GRU Chief, who was SHALIN at that time, not to run any operations during that time. However, the General permitted IONCHENKO to go out for an agent meeting since one was scheduled for the 10th of May. I remember the date since it is my mother's birthday. The incident actually occurred at the time that a Turkish lieutenant was handing IONCHENKO a military manual.

[redacted]

32. S: I was sitting in his office when the Embassy Duty Officer reported to the General and said, "Comrade General, yourassistant has been detained by the Turkish Counterintelligence due to his attempt to obtain a military manual from a Turkish officer." The General was completely upset and told me to go to get him out. I said, "Why did you let him go to this meeting?" The operational funds in Turkish lira were in my hands, but the General gave IONCHENKO money out of his own pocket. Some 200 lira to pay the Turkish officer for the manual were given and this was done so that I would not know about it. This is a considerable sum and it was not taken from the operational fund so that I wouldn't know. But since this compromise occurred, the General admitted it to me. We had an argument. I told him that he had always accused me of being a bad operator, inexperienced, etc.. He was preparing a cable to Moscow and I asked him, "Are you a Communist?" When he answered yes, I asked him why he had to lie. He asked me to leave the office, saying the affair was none of my business, and I said that I would report on the matter through another channel.

33. S: Then I actually reported the incident through the KGB channel, our neighbor's channel. It was through YEFZIN who was then the KGB REZIDENT about whom I am reporting to you now as the recruiter at the University of these negroes who are sent here from Africa to study at Friendship University. They are going to form powerful REZIDENTURAS. YEFZIN was then a colonel. Now, I believe, he has already been promoted to General. He also had been the KGB REZIDENT in India and his cover position was that of counselor. My cable was received by SEROV, the same SEROV who is now chief of GRU. SEROV immediately reported this cable to KHRUSHCHEV since all compromises must be reported to the Presidium, but SHALIN brought in the cable from SAVCHENKO-BUBENKO. ZHUKOV was then the Minister and the cable went through the Chief of Staff, SOKOLOVSKIY. KHRUSHCHEV yelled, "Which fool is the liar? (Subject's true name) or the General? Figure this out and report." I had told the truth and all I could be accused of is having spoken coarsely to the General. But even then that was because he was always criticizing me unjustly. I did not receive any reprimand, not even along the Party line, but the General received a severe reprimand from ZHUKOV, incompetence in duty. Shortly after my departure from Turkey he was removed and recently he was discharged. He is now working in the Institute for Area Studies as a department chief. G: At that time SHALIN was the chief of GRU? S: Yes, yes. SEROV only came in after SHELEPENKO, and SEROV was then the chief of KGB but he had as of then remembered my name because of the cable. We call them neighbors and they refer to us as nearest neighbors.

34. S: Well then, gentlemen, up to November I was still working there. I called the Turkish Counterintelligence anonymously once more and at that time there was a Turkish military exhibit. There was an assistant case officer, you may remember him, his name was SAVIN, who together with some Bulgarian agents stole a military manual. The officer I spoke to on the phone said to me in clear English that I should drop in to speak with him, but I refused because at that time I was still undecided. I was not sure to whom I should appear, but of course if then they had made this accusation with respect to my father and had expressed political distrust,

I probably would never have gone back to the USSR even then. I called up this last time on the 4th of November 1956. You can check this since the call must have been officially recorded.

35. S: On the 6th I left Turkey by train toward the East entering the USSR via Armenia. Upon arriving in Moscow both SHALIN and KISLENKO jumped on me. Evidently this SAVCHENKO-RUBENKO is their close friend. He had sent them all kinds of gifts and they had drunk vodka and wine together. They were indignant that such a 'snot-nosed' young colonel could have behaved that way with respect to a general. They assumed that I wanted to trip up the general in order to be the military attache in Turkey. To tell the truth, when I was acting military attache there was more organization than under the general and I could have run the agent net effectively. But I swear to you that that was not my motive even though I would have liked to have been the military attache. (Note: Wine was served and, incidentally, a very dry, mild Liebfraumilch was the only beverage consumed throughout all meetings.)

36. G: Could you help me fill out some names and patronymics and to review the organization of GRU? S: Yes, I'll be glad to. First of all it is called "The Second Chief Intelligence Directorate of the General Staff". The chief is SEROV. The deputies are now Gen. Leit. MANSUROV and Gen. Leit. ROGOV. G: Is ROGOV the one who is the deputy for all administrative matters? S: MANSUROV is the one responsible for administrative matters, but ROGOV is the one for operational matters. All cables go to ROGOV.

37. G: At one time did you not have a staff for Strategic Intelligence which was headed by a vice-admiral, but later this was changed again? S: Essentially we have strategic intelligence, operational intelligence, and military intelligence (VOYSKOVAYA). Many generals and admirals have left Strategic Intelligence and have joined Operational Intelligence.

38. S: The First Directorate -- that is the directorate of EFIMOVSKIY. He is a vice-admiral. The Second Directorate - under a lieutenant general - is the one involved with strategic intelligence on Europe. The chief is Gen. Leit. KONOVALOV. This includes Scandinavia. G: What are their names and patronymics? S: I never tried to remember them. We always addressed them as comrade-general. But I will get them for you later. For a long time the deputy to Gen. KONOVALOV was Gen. Major MELKISHEV, an air force officer. But now - before - there was Gen. KISLENKO -- I'll tell you what happened about him later. That was still at the time that SHTEMENKO was chief and SHALIN was his deputy, and later SHALIN became chief again; he became very ill. SHALIN is still ill, but is still alive. KISLENKO was discharged.

39. S: Now, Gen. MELKISHEV became the chief of the Fourth Directorate which is the Eastern Directorate of Strategic Intelligence. He replaced Gen. ZOTOV. ZOTOV, Gen. Major, had been a military attache in Italy and in France and he will go as the military attache to Hungary on the 10th of May. Our Strategic Intelligence Directorates are all on the fourth and fifth floors. Now the Third Directorate is the Directorate of Gen. Major SOKOLOV. It is the Anglo-American Directorate. I am now under the T/O & E of this directorate because I am sitting in the Canadian Section of the

[redacted]

Committee and our OTDEL consists of officers who are working under cover in Moscow. We have a total of 58 officers including myself. In all ministries which have any foreign relations, there are strategic intelligence officers. As members of these ministries and committees thereof they have contact with and conduct intelligence against visiting foreign delegations, tourists, lecturers, etc..

40. S: There is also a Fifth Directorate. The chief of this directorate is the former chief of the MDA of whom you (G.) have reminded me - Gen. Leit. KOCHETKOV. This directorate is concerned with the placement of REZIDENTURAS in all countries including the countries of People's Democracies, and the preparation of diversionists groups. This directorate studies all critical targets such as bridges, tunnels, etc. and analyzes drop zones for large scale operations for General Staff use as well as small group operations for behind-the-lines sabotage groups. G: Are they now engaged in sabotage activities? S: No, they are not now engaged in sabotage activities, but they do have the personnel trained and placed in critical areas where they will act when the order is given. G: In all countries, including the Democracies? S: In all countries, but in the Democracies it is of a different nature, like stay-behind, because we do not conduct active intelligence against the Democracies. We have a Tenth Directorate of the General Staff which deals with all matters of a military nature with the People's Democracies through the military attaches and this Directorate controls the delivery of all rocket weapons, in the countries of People's Democracies.

41. S: In this year all countries of People's Democracies must be furnished rocket weapons. VARENTSOV and his people are also working on the development of bases, storage areas, launching sites, and the training of cadres for the countries of People's Democracies. The rockets which we are now delivering to these countries are those which are now being mass-produced such as the R-11 about which I gave you a report. This one, and in addition all those which are on production lines, are being given to China and all other countries of People's Democracies. (Note: Later Subject emphasized that Albania was the one exception, due to the recent "revisionistic" attitude of Gen. Enver HOXHA.)

42. S: In the DDR we now have four brigades and of these two brigades already are equipped with atomic warheads. They also have special storage facilities and the engineers of the Artillery Academy Dzerzhinskogo are working on this. This Academy is now in the hands of MOSKALENKO, which occurred after the accidental death of Marshal NEDELIN due to a rocket disaster. That was not an aircraft accident. The report was a big lie deliberately reported to the world. But I will give you all details of this separately. I wrote a little about this but I must add to it because it is impossible to write all details.

43. G: Let me fill out the GRU organizational chart. S: I have given you five directorates, and there is no Sixth Directorate so designated. There is a separate Eighth OTDEL called the Coding Section and there are Rear Services units (SLUZHBY TYLA) which provide logistical support such as clothing and even diamonds and gold for agent operations.

[redacted]

[redacted]

44. G: What number does the Operational Directorate have? S: Under SHALIN that was the Sixth Directorate, but now it is being changed. However, it is under SEROV and may not be of quite the stature of an UPRAVLENIYA now. They control all of the RP Points in all of the military districts and with the Groups of Soviet Forces and they have a dual subordination. They report to the headquarters of the various military districts and also to us in headquarters. But, as I understand the structure now, it is not of the same stature as an UPRAVLENIYA as it had been before. Often Strategic Intelligence officers are transferred to Operational Intelligence. I remember that MORGUNOV came to Turkey after I left and worked with this Gen. SAVCHENKO for a while and did something wrong with money and received a criticism along Party lines and was transferred to an RP Point in Leninakan. G: Is the chief still Gen. SHERSTNEV? S: Yes, that is right, but it is no longer an UPRAVLENIYA. I would call it a group (GRUPPA) of Operational Intelligence. I recently heard, however, that SHERSTNEV will not be there any longer. G: What is ROMANOVSKIY doing now? Will he be the new chief? Who is the new intelligence chief in Germany? S: I remember ROMANOVSKIY's name, but I don't know where he is. The new chief in Germany is a lieutenant general. I will remember his name in the course of conversation. It escapes me right now. He did not get along with SHTEMENKO who sent him out.

45. S: Let me see -- there are a number of other services, and the MDA is also under SEROV. Now the course is only three years and the present student complement in the incoming class is sixty students. The graduating class has ninety students and the second class has seventy to seventy-five students. This last class is the one for which I selected the students. When I was at the Academy there were a hundred students, actually ninety-eight since two were summarily dismissed for political reasons. Now the classes are smaller because there are a large number of MDA graduates already who are members of Strategic Intelligence. Now our neighbors, the KGB, take almost half of our graduates, at any rate, somewhere between 30 to 40%. The KGB does not have a formal academy of their own for training their intelligence officers, but they do have intelligence missions abroad, primarily along political intelligence and technical intelligence lines. They take cadres from our academy and in one case, I remember, they took up to 50% of the graduates. Quite a number of those who graduated with me were taken by KGB. I may be able to identify quite a number of them from photographs and I know what cover many of them operate under.

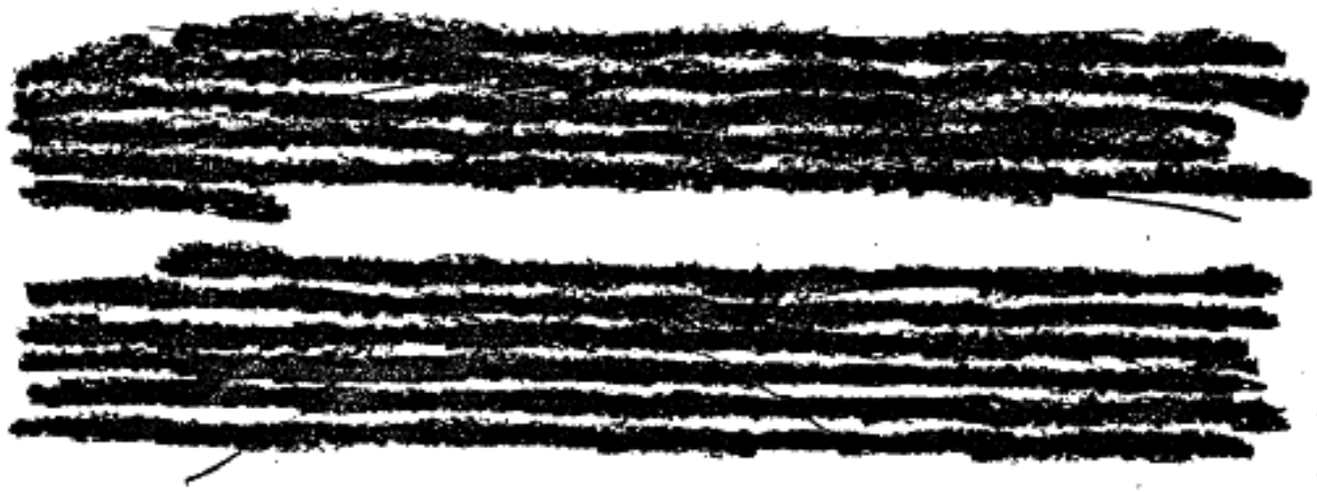
46. S: Well, having returned from Turkey, SHALIN and KISLENKO jumped on me. They accused me of having generated ill feelings with the general which was harmful for the GRU effort there and served no useful purpose. Basically, they said I was right, but I was not right to have behaved in a hooligan manner with him. They said further that no general in the GRU wanted to work with me because, "you are a tattle tale (KAPALSHCHIK). Furthermore, you went out of channels. Why did you report this to SEROV? You disgraced us in the eyes of our neighbors." So, since no one wanted to work with me, what should I do? I went to VARENTSOV. He told me to wait awhile -- until things blew over. I even went to see SHTEMENKO several times. He told me that he didn't know me and that I had made such a mess with my associates that he could do nothing for me. That was logical since, after-all, SHALIN was his deputy. He couldn't go against his deputy whom he depended upon for his operational experience. After all, SHTEMENKO had been Chief of the General Staff and previously had been a military district

[redacted]

commander, but his knowledge of intelligence matters was so-so. Thus SHTEMENKO and SHALIN rejected me and KISLENKO was preparing to retire.

47. S: By the way, excuse me...I just remembered. After KISLENKO, the Gen. Maior who took over the Fourth Directorate - I'll remember his name in just a minute - he is now the deputy to KHLOPOV who is the Chief of the MDA. He is the deputy for scientific research there. Still earlier, before he turned over the Fourth Directorate of ZOTOV, he had been the chief of the Military Diplomatic Service Faculty of the MDA.

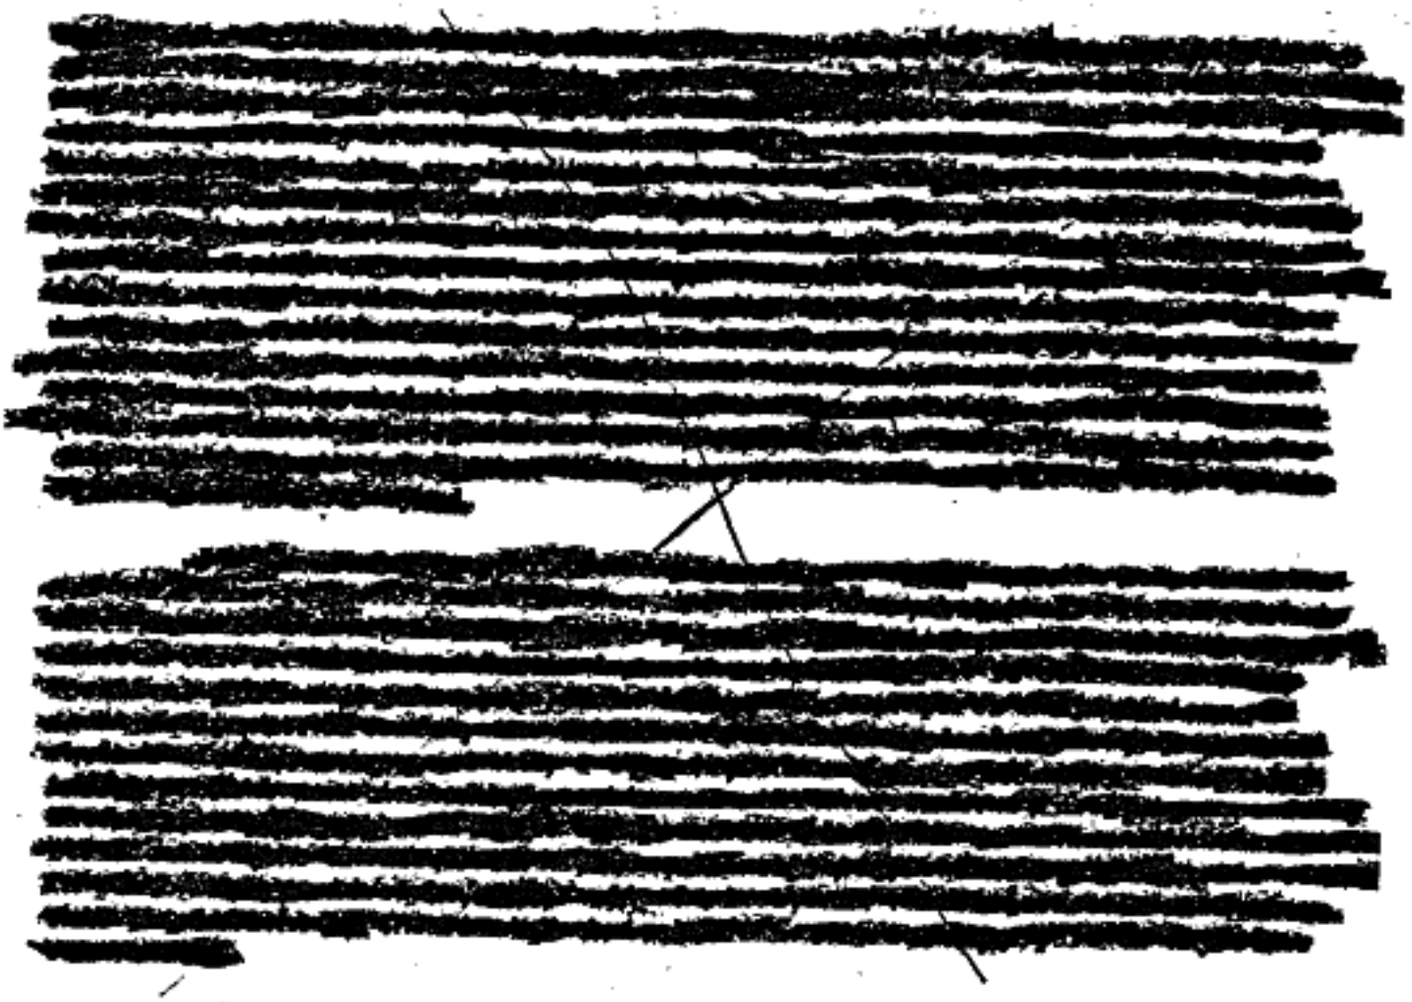
48. S: For a long time they kept me in the GRU reserves. They gave me intermittent assignments and then returned me to the reserves. This continued until the time KHRUSHCHEV removed SHTEMENKO. KHRUSHCHEV was afraid of ZHUKOV and SHTEMENKO was closely associated with ZHUKOV. And SHTEMENKO, without the knowledge of KHRUSHCHEV, on his own initiative opened a diversionists' school. ZHUKOV knew about this. When ZHUKOV stated, "The army will follow me", KHRUSHCHEV took action and it was discovered that SHTEMENKO and ZHUKOV had a large sabotage school in their hands. It was located near Tula. About two hundred specialists were being trained there and KHRUSHCHEV thought that these could be let loose against him. Somehow this did not get to KHRUSHCHEV since the Ministry allocated the funds and the information did not go up to the Praesidium. SHTEMENKO was removed and sent as the deputy commander of the military district with headquarters in Sverdlovsk.



49. S: I just remembered who this Gen. Maior was I mentioned earlier who had taken over the Fourth Directorate. It was Gen.Maior LYAKHEROV. G: Previously he had been a senior instructor at the MDA. S: That's right and later he became a department head. You know these people very well. G: Did you ever hear of a Col. PAPPE who is an instructor there? S: Yes, he is an instructor there, but he has recently been dismissed. By the way, SHTEMENKO who is now a General POLKOVNIK is the deputy commander of the Ural Military District with headquarters at Sverdlovsk and previously he was the commander of the Voronezh Military District. Four military districts have since been consolidated.

50. S: In September 1959 (at a later meeting Subject corrected this to September 1958) I was sent to the courses at the Military Academy imeni Dzerzhinskogo. These were called the courses of the General Staff for the study of new technology. Under NEDELIN the entire Academy Dzerzhinskogo on Salyanka -- you know where that is. Previously this was purely an artillery academy, but now it is an academy for rocket artillery and is under the control of MOSKALENKO. He came in after the death of NEDELIN and had been the former commander of the Moscow Military District. The Academy does not train any officers in conventional rifled artillery at all. There were four faculties at this Academy and now there are five. There is a new faculty on electronics and radio technology.

[redacted]



51. G: What is the formal name of the Academy? S: It is the Military Artillery Engineering Academy imeni Dzerzhinskogo. There are now 2,500 students there. Many capable young officers of the air force and of the navy who had some minimum technical ability were not demobilized in the general reduction program but were sent to this Academy. The students are trained as specialists and engineers in the employment of all types of rocket weapons. Specialists are particularly trained to service the rockets on their testing pads prior to launching. This training is under the direction of very experienced engineers of whom there are not too many - about thirty or forty. I graduated from these courses with distinction. The courses are given annually and are given even today, but the continuous duration of the annual courses is actually nine months.

52. S: I graduated on 1 May 1960 (later corrected to 1959). Immediately after graduation, BEROV, who had been informed of my progress, suggested that I go to India since India is considered to be our territory, that is, we might want to conduct operations in that territory in the future. Therefore, it would be desirable that an officer with my background in rockets should be sent there, since it is possible that in the not too distant future rockets may be given to India. I was almost completely processed to go. PAVLOV had been the military attache there - he has since been removed - and now there is a Gen. Major who is a troop commander there. I wrote about this new tendency of not having intelligence officers occupy the slot of military attache -- . And since the new military attaches do not need to have any intelligence background to fulfill their functions, they take people from troops -- just 'junk' who have no language or area knowledge, just a representative - a general to represent the Armed Forces of the Soviet Union. So a general was sent there and his senior assistant was a classmate of mine. I'll remember his name in a moment. Just as I was all set to go I was called out by Gen. Major SHRACKIY who is the deputy to Gen. Leit. SMOLIKOV. The latter was just promoted to Gen. Leit. in 1960 and heads the large Personnel Directorate. He is also the chief of the Personnel Section of Operational Intelligence. He has a whole breakdown there. They are really NAPRAVLENIYE. The Personnel Directorate is another directorate just like the ones we have listed and is part of the GRU.

[redacted]

[redacted]

56. S: There were all kinds of small changes in subordination and it is only by chance that one can find out what goes on in another department. For example, I cannot use my pass to enter the First Directorate of the General Staff the Operational Directorate.

57. S: Well then, they did not send me to India. I was very disappoir about this and was very worried. To be quite honest with you, my disaffection with the whole political system began quite a long time ago. I disagreed with many facets of life there -- I will not bother you by listing categories, but the whole set-up was one of demagogery, idle talk and deceit of the people. The people were waiting patiently for a long time and now they are tired of waiting and they are restless. Actually, KHRUSHCHEV to some degree has decreased the KGB controls. Many persons have been rehabilitated or received amnesties, and now one can say certain things, not everything of course, without being immediately arrested as was the case in the past. Of course, if this is done to excess a man can be ejected from the Party. He can be arrested and, of course, his working future would be limited.

[redacted]

[redacted]

58. S: There is a difficult situation in the country right now. Everything is subordinated to the armaments race, and also a great deal of money, billions, has been spent to sustain the countries of Peoples' Democracies. China has been given a great deal and now everything is directed to equipping our forces with rockets. Everything is going for rockets. In this respect they have already attained a measure of success. Some rockets are already proven and some are not yet properly developed. The greatest deficiency is in the field of electronics. Our main launching test site is at Kapustin Yar and the impact area is in Kazakhstan. There were very many cases where rockets had struck railroads or a settlement because they had deviated from their assigned course.

59. S: But a great effort is now being made; they have mobilized scientists, the most outstanding ones. Some of them have received four decorations as Heroes of Socialist Labor, and these never appear in newsprint, photographically or otherwise. They may be seen only on occasion at Party Congresses. They constitute a small circle and are given no publicity. There are little settlements (GORODKI) near Moscow and there is one GORODOK in which German scientists live. These are the ones who were involved in the development of the V-2. These Germans are used to a great extent and they are very well subsidized with the comforts of life including automobiles. Their families are with them and they have special schools for their children. Similarly all other scientists are kept isolated and in secrecy.

60. S: When this accident befell KHELIN, they were testing a new rocket. It was a two-stage rocket. By the way, when the SPUTNIK was launched it was with a two-stage rocket. The fuel was liquid; I wrote up the composition of the fuel. The very first SPUTNIK was launched with the help of a cluster (PAKET) of rockets. The rockets R-11 and R-2 were joined together in a cluster. Later I will draw what this cluster looked like. The overall weight of the rocket was about 100 tons of which the weight of the fuel was 68 tons. An outstanding engineer told me about this when I was studying at the Rocket Academy. Boron was one of the basic fuel components and this was being tested for the action of a new type of fuel, namely, by the fission of atoms in one stage. The accident occurred because the upper portion of the rocket was ignited. This upper portion, upon being set off, fell toward the earth and an explosion took place. Many scientists were killed, and among them was KHELIN. Just now GAGARIN was launched with the help of a large two-stage rocket. They say that the overall length of such a rocket is 24 - 28 meters. They are erected by a special hoist and tower and have their own launching pads. These launching pads are special ones, not the type that I have described for the ordinary free rockets and guided missiles. This is the field of endeavor now.

61. S: Let me finish my thought now or I will be out of sequence. I was thinking of becoming a soldier in a new army, to adopt a new people, to struggle for a new ideal, and in some measure, to avenge my father and millions of other people who have perished in a terrible way - as well as for my close relatives, etc.. I thought that words are, afterall, just words, but I should bring something tangible from the place where I sat. I was the

[redacted]

[redacted]

head of my class of eighty students. By 'head' I mean that though there was an assigned colonel who was the actual chief, I acted as the master sergeant of the class. At any rate I had a certain amount of authority. My own studies were outstanding; I had the opportunity of taking books as well as classified lectures from the special FOND (a classified library). By means of a pass, I had the opportunity of working independently. I had a notebook -- I even blocked the door by placing a chair under the knob -- and I studied by myself. If anyone knocked I would slide everything into my briefcase which was sealed, and I would simply say that I was studying. G: And this is the manner in which you wrote up all of your material? S: I copied everything down and, not having any camera, this writing took a very long time. G: And what time period did this cover? S: This was done during my courses. Everything was done consecutively and I did most of this writing in the evening. We were first taught free rockets, then guided rockets, and then all types of launching equipment and technical checking at various stages. Then we were given examinations. I graduated with distinction and received a certificate which I now have home and which I can show you, if you like.

62. G: Did you ever study ICBMs? S: No, we did not study them. But I can tell you this. There is nothing at all that is unusual about them. All these ICBMs and the rockets for launching humans into orbit are constructed in exactly the same way as the others except that they are much larger and have very large fuel capacity to give a greater thrust. The working principles however are identical. Thus this latest SPUTNIK was launched by a rocket of large size, working on the same principles. It was also a two-stage rocket, not a three-stage rocket.

63. G: Are the guidance systems for those large ICBMs not yet perfected? S: The electronics development is far behind. They are struggling with this. The foreign delegations who come to visit you, and now I must say that the American people are doing a very wise thing by cutting down on the number of scientific exchange delegations and contacts. The British are not yet doing this. There are still a great number of delegations going to England and a great number coming to us from England. Of course, I do not know, nor is it any of my business to conjecture on what benefit British Intelligence derives from these visits, but I can show you the technical reports which I have in my hands at the Committee. For example, there are twenty-two items (RATSIONALIZATORSKIKH PREDLOZHENII) exclusively on synthetic rubber which is of great interest to us now since we have had trouble in its production. The Canadian firm, the POLYMER Corporation, was visited and many problems were clarified.

64. S: We always get technical briefings for conducting technical intelligence. When our scientists and technicians are sent, they don't tell them to spy. They simply say 'to study' the problem and to adopt any useful process into their own industry. So they give them money, a free ticket, and send them off to study processes which can be usefully installed in our own industries. I can judge only by the twenty-two reports in my hands what shortsightedness and blindness there is to permit access

[redacted]

[redacted]

of Soviet scientists to such important centers, especially when the scientists have been specially trained in such matters.

[redacted]

66. S: How they will permit our people to attend electronic demonstrations here in England such as Plessy, Ferranti, and another one - I believe its name is Leo Something. Two members of my delegation are very experienced men in this field. They will certainly pick up something of value even though the firms will be careful not to divulge their secrets. However, since these people of ours are experienced and they will be shown various things, undoubtedly they will be able to find something of value. It astounds me how freely some of these things are shown in certain free countries. It is not for me to criticize, but since I now consider myself a representative of the Free World also, I feel that I have the right to criticize as I wish.

67. S: Well then, further, I will speak about the Committee in detail later with respect to its structure. The Committee has now become very large. Before, it was the Government Scientific-Technical Committee. Now it is the Government Committee of the Council of Ministers of the USSR on the Coordination of Scientific-Technical Work. KHRUSHCHEV became the chief. He is the deputy to KHRUSHCHEV, that is, one of his deputies. What this means is a still greater effort is being made to assign missions with an improvement in administrative leadership in order to still further activate scientific intelligence through the overt legal scientific delegations of specialists. Therefore in the future if access is given to these people, I would consider this to be shortsightedness, although I understand that all of this cannot be broken off suddenly. After all, many firms are engaged in normal trade relations. However, there should be many areas that are of no scientific interest or value. For example, where do we permit foreign specialists to go? We have many open installations where very little, if anything, of value would be discovered by making a visit there. Therefore representatives of capitalist countries are shown worthless installations. If requests are made to see something that is really of value, all kinds of excuses are given such as a bridge is closed, or repairs are being made, or anything to serve as an excuse. The legend is sometimes so stupid that your people see through it, but just the same they are not permitted to see what they want. Even though your people may find something of value, I am sure that it is not comparable to that which our scientists pick up.

68. G: Would you know of the location of any missile bases which may be planned or under construction even though they are not yet in use, that is, bases which can theoretically be used as ICBM launching sites, whether they are fully equipped or not? S: As you must realize, such locations are kept in utmost secrecy. In our Directorate the only ones who would

[redacted]

know about these would be SEROV and the directorate chiefs. I doubt if any subordinates would know it. However, our country is full of rumors. I have heard, for example, that bases and troops, that is, rocket troops, for use against England are located north of Leningrad, toward Murmansk, and to the north. The exact coordinates of their location are known to a very small group of people and the data lies in underground safes in the Arbat District. There are many things which I must report to you, and even though I may repeat certain items from time to time, at least I will expand on them. The General Staff of the Ministry of Defense is located in the Arbat area, that is, in the blocks bounded by Frunze Street, Gogolevskiy Boulevard, and Antipiyevskiy PEREULOK. (Note: See map of Moscow.) This should all be blown up with small, two kiloton bombs.

69. G: Please trace for me your path when you go to the GRU from the Arbat subway. S: First you pass through this little tunnel. Then there are three pass offices for various buildings. In the first building here sits Gen. Mayor SOKOLOV. He is the chief of the Foreign Relations Section of the Ministry of Defense. He is an intelligence officer and was formerly the chief of my class at the MDA.

70. S: By the way, the General Staff of the Ministry of Defense is connected to the Kremlin by means of a subway tunnel. You probably know that there are two Arbat subway stations, the old one and the new one. The tunnel leads from the new station to the Kremlin. The Minister of Defense and the Chief of the General Staff have offices in the Kremlin adjacent to the government offices and they use these whenever necessary. When they are not making reports in the Kremlin their headquarters are in the Arbat area. They go back and forth either by car or by subway in a special subway car. There are underground safes here which can be opened only by registering. This material is accessible only to special general officers at the direction of the General Staff. The normal operational charts by military districts are maintained by operations officers in a separate area.

71. (Subject spotted on the Moscow map the headquarters of the PVO of the Country which is under Marshal BIRYUZOV.) S: The command points of the PVO are located in the basement of the Lomonosov University in the Lenin Hills, and another command point which is really the Command Point of the Moscow Defense Zone is on Kirov Street, next to the Kirov subway station.

72. S: In the same group of buildings with the PVO of the Country is the headquarters of GAU, the chief of which is now Gen. Polk. ZHDANOV. Formerly the chief was Marshal YAKOVLEV whom STALIN removed because of malfunctioning of anti-aircraft artillery caused by overheating. For about three years after the end of the war there were no adequate anti-aircraft guns. They had installed liners and had cooling systems, and in addition there were recoil springs which would constantly break. Due to these failures, regarding which YAKOVLEV was accused of deceit, he was removed. If at that time bombing attacks had been made, there would have been no adequate automatic anti-aircraft artillery to defend Moscow. Now they do have automatic AAA. At one time YAKOVLEV was the deputy to BIRYUZOV, but now he is being retired for reasons of health.

73. In these also are located the Engineering Directorate and the Chief Directorate for Military Training. The Chemical Directorate is also there. On Red Square opposite the Kremlin in the so-called "Second House", the Chief Medical Directorate is located, as well as the Rear Services Directorate such as Automotive, Quartermaster - in short, the Rear Services. The reason why I mention this to you now, and I will mention it again later, is that as a Strategic officer, a graduate of two academies, and having worked for some ti e in the General Staff, I know what the sensitive spots are. I am convinced that my viewpoint is absolutely correct, namely that in case of a future war, at H-hour plus two minutes all of these critical targets such as the General Staff, the KGB Headquarters on Dzerzhinskiy Square, the Central Committee of the Party which organizes everything and similar targets must all be blown up by atomic prepositioned bombs, rather then by means of aircraft bombs or rockets which may or may not hit the vital targets.

74. S: In our Soviet Army we have a five kiloton, a ten kiloton, and higher weapons, but they have not been able to produce a one kiloton weapon yet. Our scientists are still working on it. I know this exactly. Such weapons would not need to be set within the buildings themselves, but there are many adjacent buildings where they can be concealed. Dwellings and stores are adjacent. For example, there is a large GASTRONOM next to the KGB Headquarters. The KGB Headquarters has seven basements in which many people have been executed. They also have eight or nine floors above the ground. I don't remember how many.

75. S: A small group of saboteurs equipped with such weapons should plant them governed by a time mechanism in the locations from which all of these headquarters can be destroyed. Irrespective of what other attacks will be made at H-hour, these essential headquarters must be destroyed by planted bombs. All military district headquarters must be destroyed. These headquarters can be easily spotted in every major city. They are easy to find in Leningrad, Sverdlovsk, Voronezh, Novosibirsk - I give these as examples. All one would need would be one man to do this per military district. This would destroy the mobilizational and organizational directorates which are the backbone of the Army. If these headquarters of the General Staff and the OKRUGs are destroyed, this will reduce the combat strength of the Soviet Army to a very great degree. A number of months would be required to assemble more or less experienced men from the reserves. Furthermore, not all of these can be trusted like ones now sitting in the headquarters. The complete disorganization that would be created could permit the execution of a military decision.

76. S: It would be well to destroy also all of the VOYENKOMATY of the OBLASTS. These are all easy to locate. In these VOYENKOMATY are also located the records and personnel of the city, RAYON, and even settlement VOYENKOMATY. The latter are responsible for mobilizing the village draftees. Of course it is difficult to destroy a headquarters down to that level, but to destroy the headquarters of the OBLASTs, VOYENKOMATY - of which there are eighteen or twenty - and the prime headquarters objectives is mandatory. The

Germans did very little damage. A few minor fires and broken roofs and glass, but the staffs remained in operation. This was due to inaccurate bombing. But now possessing atomic weapons, small size weapons of one or two kilotons as required can destroy these vital targets completely. The exact timing for this destruction is up to the big people who have to make the decisions.

77. S: But please give me your opinion of a Strategic Intelligence officer, now your soldier, your worker ready to fulfill any missions you may assign to me now and in the future. All I ask is for you to protect my life and I only have three persons close to me, my wife, my mother, and my daughter. I would be happy now to go to England or America myself, but I cannot leave them behind. It would drive me insane in time thinking about this should I leave them behind. I have to prepare a basis for my future existence and I believe that I can serve you most usefully in place for at least a year or two, particularly if I were to work under a specific directive set by you to fulfill missions which would be within my capability to accomplish. All I have said above about destroying our headquarters is my opinion.

78. G: With respect to what you have asked us, we are completely prepared to grant you your minimum requests. Of this there is no question, and it is most gratifying to us to realize that you can still continue to work inside for a year or two. We can give you in hand whatever you need and the balance we can deposit for you in the bank. Not only will this be an accumulation of monthly payments, but after you have joined us, we will review your entire scope of activities. S: That's right. Just so I have a basis (nest-egg). I see in your faces official, responsible high stature workers, my comrades, and also being an intelligence officer I know how to vet people (ZAKREPLIAT'). There is no need to keep things in the dark. No one needs this. I wish that your governments, and I consider them both my governments, to trust me as their own soldier. It doesn't matter whether you confer the title of colonel on me or not. I am still full of energy, although as WYNNE may have reported to you I have been nervous recently; and I have this eye disturbance which I picked up in Turkey, although my vision is perfect.

79. S: My request to you is this -- set up for me a definite, material basis. In general, I am a man of some substance. I have been a colonel now for eleven years. Previously I received 5000 rubles per month; now I receive 4,500 (old rubles). I have an apartment with quite a few personal items. I have been a regimental commander, and I have also been abroad. Everything is legended normally for me to have something. I married the daughter of a General Leitenant who had given her a lot of money, and in general my standard of living is good. But I would like to live even better, and to provide luxuries for my family. This is all explained at home easily because anyone who has been abroad would normally acquire all sorts of things to bring back. These things are acquired from one's own savings. As you well know, there are many things completely unavailable in the USSR and others that are extremely expensive.

80. I would like to receive a certain amount on hand, about which I would like to consult with you. I was thinking of acquiring a DACHA just outside of Moscow. A modest DACHA is entirely normal for someone of my age

and status. This would cost about 10,000 rubles in new money. After returning from the Front, I had a Mercedes-Benz, but after riding around in it I sold it since I couldn't get parts and I was thinking about buying a VOLGA. All my comrades have cars. From my small savings and the money I have I usually spend quite a bit on my family and to go out to restaurants. I am not an ascetic . .

81. S: What I would like to do is to swear an oath of allegiance to you, to give you a signed statement and to swear an oath in order to formalize our relationship. Secondly, to work out a communications system with me without personal meetings -- providing me with dead drops where I can pass materials. I would prefer not to meet with anyone. I did have the desire before of meeting with an American or a British representative and to ask them to take me off somewhere overnight. Our Counterintelligence is not operating as intensively as it would seem. People are caught primarily because of crude errors. Now that we have met, thank God -- and I have begun to believe in God -- we can consult on all these things together, and frankly I would like to avoid personal meetings.

82. S: It would be well if I would remain with the Committee for the time being. I have planned a possible trip to Canada in about three months. In addition, on the 24th of May, MCCLELLAN is arriving from Australia. I also am assigned to that country. In the Fall they want to send me to Australia. Yesterday, however, they issued me a passport with great difficulty. They are undecided. Some believe in me and consider that I have been a reliable Communist since 1940, a man decorated in the war, a regimental commander and two higher educations. They even sent me to the rocket school. In addition I have a great number of friends and many of them high-ranking both in the GRU and in the Artillery. We are such close friends, VARENTSOV and I, that his wife serves me soup before she serves his. I already told you about this matter with Nina. At any rate, we are close friends. VARENTSOV even spoke favorably about me to SEROV.

83. S: Incidentally, neither SEROV nor VARENTSOV know anything about my father or that this archives material has been unearthed. They do not know why I was held back in Moscow. I said simply that the climate in India is bad, pretending that I didn't want to go there myself, although I had already given my consent to go. Others, however, waver and consider that it is not right that a son of a White Army officer should have extensive privileges. There is no such thing as the democracy they speak about. It is all a lie and a bluff. Thus far I can maintain myself because they know they cannot simply dismiss me for then I would have every reason to go over to the other side. They would have to isolate me and keep me under constant surveillance. Right now my work is going well. I am receiving commendations and even monetary rewards. I feel I must develop my work in order to show that I have extensive agent contact capabilities in the field of economics and science, as well as for the GRU.

84. [redacted]

[redacted]

I do not have a document to support this, but I know this is a fact. G: Where did you find this out? S: The man who told me this is a civilian who works in the Central Committee of the Communist Party. He stated that at a dinner party given by VARENTSOV. [redacted]

CHURAYEV

85. S: Another interesting matter -- I wrote in my list about Perkhushkovo. It is near Moscow. This town is now the headquarters of MOSKALENKO, the headquarters of Strategic Rocket Forces. Previously this had been the center for training political officers. This was high level people; generals would attend completion courses there. There were extensive residential layouts there in the woods. One would go there by train from the Belorusskiy Vokzal. The distance from Moscow would be somewhere from 40-50 kilometers. I have been there myself and that is where MOSKALENKO and his entire staff physically are located. VARENTSOV is now the commander of all rocket artillery of the Ground Forces. This is both guided rockets and free rockets. But the headquarters of all strategic rockets is in Perkhushkovo.

7. 86. S: Here is another interesting item. On the second of July 1960, a letter of the Central Committee was issued concerning raising revolutionary security. This letter contained a curious statement and I wrote it down. A scientist who came from the USA and who was visiting the USSR, was called by the GRU and the Atomic Energy Commission prior to his departure. His name was not mentioned in the letter but it stated that he received an espionage mission when he was sent to the USSR. He was briefed by scientific specialists on the work of atomic energy in the USSR. Possibly this scientist was broken upon his arrival in the USSR, or possibly there is someone working in your Atomic Energy Commission or, excuse me, in your GRU. But how else could this information have gotten to the Central Committee of the Communist Party? This is the warning in the letter that your scientists are being briefed for intelligence missions in the USSR. G: But they allowed him to depart? S: Yes. G: What was the name of your Central Committee informant for the information concerning [redacted] S: This was told to me by CHURAYEV, who is a good friend of VARENTSOV.

87. S: Another fact stated in the letter was that there was an English student in the Leningrad University who received the rank of Capt. Third Rank. He was conducting intelligence operations in the Leningrad University. This was an example of what kind of people are arriving in the USSR. My thought immediately is where is the leak? Either these people are broken, or there is someone working for us among those who brief these people. G: Were these cases accusations or did the individuals confess? S: He confessed.

X

X? also? CHINAYEV
Mps? 8/31

[redacted]

88. S: Let us go further. I made a note here on the RB-47. This was brought down by rockets fired from a MIG-19. This MIG is equipped with four rockets, two upper rockets and two lower rockets. The rockets have a homing device; their range is between four and five kilometers. The point I wish to make is this. When the plane rises to an altitude of between 18 to 20 kilometers, it still has the capability of firing an additional four to five kilometers higher. Therefore when KHRUSHCHEV said that our planes can reach over 20 kilometers, even though we have no planes which can do this yet -- they are still experimenting -- the striking ceiling is actually above 20 kilometers when one considers the additional four to five kilometer range of the rocket. Anyway, the MIG-19 fired a rocket at the RB-47, and I can say with full assurance since I have checked this with many sources, that the RB-47 did not violate our borders although it was close. It was actually over neutral waters. Our pilot had itchy trigger fingers and fired the rocket which knocked it down. The length of the rocket is three meters. Only the two upper or the two lower rockets may be fired simultaneously; otherwise the plane would break up.

89. S: There is a town called Klintsy, where atomic warheads are assembled. I told you earlier that there are rocket bases north of Leningrad directed against England. There is a city called Severomorsk. A PVO regiment is stationed there. This regiment is equipped with V-75 rockets.

90. S: When asked about Soviet intelligence officers, Subject said, "If you would only show me a set of photographs, we would do a lot of good work since I can identify a pretty large number, well over a hundred." G: Are you personally acquainted with any illegals at all? S: I can tell you about those who have returned from illegals' work -- for example, such as this man from the German area (SHCHERBAKOV) -- who are members of the present incoming MDA class. I can also tell you which of my classmates are being trained as illegals. But whether they were dispatched out or not I do not know. The GRU has many covert installations such as those used for training illegals. All of this is handled by the First Directorate.

91. G: If you have time it would be very helpful if you could write out the names, ranks, and what you know briefly about other GRU officers, particularly your own classmates because you probably remember them better than others. S: There were 98 graduates in my class and I can probably list a large number of these. Let me name a particularly effective and dangerous intelligence officer. He was previously in England in the APPARAT of the Military Attache and he graduated with me. His name is Col. FEDOROV. He is an artillery engineer. Right now he is Military Attache somewhere in the Scandinavian area. He has many agents. I will name a lot of officers who have extensive agent contacts. Then I am prepared to give you a list of 15 agents who are presently located in Ceylon, Pakistan, and India. Those in India are presently on conservation. I have all this material.

92. G: According to your time schedule you have about twenty minutes left. We can't cover everything in this session. I hope you don't mind if I interrupt you from time to time and ask a question. S: Not at all. That is a very good idea because it helps me to remember. Please prepare a set of photographs for me for identification. Now as to the tenth point I have on my agenda which I have already mentioned, that is, about what should be destroyed. If necessary I will take the mission upon myself to blow up the General Staff (jokingly).

93. S: Here is another new item. There is a new rocket. It is called the RK-14. It is a long-range rocket, over 1,000 kilometers. I have no data on it. (Subject repeats again how easy it would be to blow up the General Staff.) This rocket is fired from Kapustin Yar, and the impact area is Kazakhstan. The impact area consists of high wooden towers which are erected in a triangulation pattern. Soldiers man these towers and there has not yet been a case where a tower has been struck by a direct hit from a rocket. The rockets fall at different points which are then re-sected with optical instruments to determine the errors in lateral deviation as well as errors in range. There are radio communications for relaying the moment rockets are launched. I already mentioned that there were many cases where rockets struck buildings, railroads, etc..

94. S: Let's see what else my notes have ... Re NEDELIN's death, the second stage ignited prematurely. It broke through the lower stage and an explosion resulted which killed a large number of scientists. These scientists were the ones who were engaged in developing a new type of fuel which required a small storage space and operated on the principle of atomic fission in the rocket engine. This is what our scientists are working on now and they have achieved a small degree of progress. Although nothing has been perfected this is the basic idea on which they are working. The purpose is to eliminate the large space required for the fuel tanks and oxidizer tanks by substituting a lighter and smaller fuel component and possibly affording a larger warhead for conventional explosive as well as atomic types.

95. S: A very large rocket using atomic energy for motive power was being tested when NEDELIN was killed. He was in the shelter (KAMPONIK). I don't remember its exact designation, but it is a deep reinforced concrete structure where people sit during test observation. After ten or fifteen minutes he (NEDELIN) received a report that the rocket engine malfunctioned and he came out. But at that time the fuel system of the second stage had already ignited and an explosion occurred, killing a large number of service personnel as well as scientists. Please keep in mind this is a two-stage rocket and that basically all our rockets are two-stage. When you report this to your scientific experts, emphasize this so they won't have to guess. Even when NIXON was there a question was asked whether a solid or liquid fuel was used. Only liquid fuel is used. Thus far no type of solid fuel has been developed

which can propel a large rocket at a great range. A high-caloried fuel has been developed using Boron as a component. However, I do not know what proportion of Boron is used.

96. S: Another item I am reporting on is that military pensions are being reduced still further. Now full colonels will receive only 150 rubles per month pension, and generals up to 200 rubles (new rubles). The next item I have here is the electric drill.

97. J: Before he goes on to that, since he has been speaking of Boron maybe his memory is refreshed concerning what he said about the first SPUTNIK. S: I will repeat it again. The first SPUTNIK only was fired by using a cluster of rockets. There were three rockets below and one above, all clustered together. The overall weight was 100 tons. Of this, 68 tons were fuel - liquid - and the rest of the weight was the basic shell and all of the technical equipment.

98. S: Now I wrote about the electric drill. The reason I wrote about this is because some of your scientists have been coming to the USSR and have been surprised that we have already developed electric drilling techniques. Our scientists have been keeping this secret. The principle is as follows even though I do not know the dimensional details. There is a pipe the diameter of which is 200 - 220 millimeters. An electric motor is mounted within the pipe. The motor is immediately adjacent to the drill bit. Wires are fed down to the motor and the rotation takes place down below, not on the surface. That is the principle, but what is the failure? Recently Swedish technicians who are drill manufacturers from the well-known firm of Stipko were there (in the USSR). They have both diamond drills and hard steel drills, that is special steel drills ---.

99. S: Incidentally, I have as one (150) of my missions here the assignment of obtaining a steel called Nimonic #105. This is a heat resisting steel which is available here in England. They have various designation such as Nimonic #150, 200, 220. They are all in the catalogue. They told me to get about 100 grams of Nimonic steel #150. (Subject means #105. This is later clarified.) S: (Looking up his mission assignment notes) Here it is - Nimonic #105, excuse me, not #150. The firm that makes it is Henry Wiggin. Later I will tell you what my missions are. Maybe you can help me fulfill them.

100. S: Well, comrades -- since we are such in the Western sense -- these drill bits drill only some two and a half meters. Then the teeth break and they have to be removed and new bits put in. In other words it is all junk, even though they drill as deep as three thousand meters and more. They give you the impression that one drill goes through a hundred and more meters, and that the drilling problem has been solved by us, but that is not true. There is a whole pile of broken bits for every effort.

101. S: My next item -- the Sixth Breakthrough Artillery Division is located in the DDR now. Its designation is exactly that - the 6th ADP (ARTILLERISKAYA DIVIZIYA PRORYVA). Remember that in the Soviet Union there

are also artillery corps. This division has four brigades. I do not know the composition of these four brigades. But in addition there are four other brigades which are rocket artillery brigades. Two of these are equipped with atomic warhead rockets. The atomic warheads are not assembled on the rockets but are stored in special atomic storage depots. I don't know where these depots are, but it should be very simple for you to find out.

102. G: To whom are these brigades subordinated, VARENTSOV? Or are they considered GHQ units? S: They are under MOSKALENKO because these are considered to be strategic weapons. VARENTSOV is in charge of all rocket artillery of the ground forces which would include regimental, divisional, and corps rocket artillery. G: Even though these brigades are located in the DDR? S: Yes, even though they are in Germany. G: This would mean that they are GHQ units. S: No, but you see the General Staff in a sense complements the staff of MOSKALENKO. The Minister of Defense and the Chief of the General Staff control MOSKALENKO, but this unit is not a part of the military formations under VARENTSOV. He is in charge of the Ground Forces Artillery which consists of rifled artillery and free rockets and guided missiles of a short range - tactical - but strategic missiles are under MOSKALENKO. He controls the ICBMs, the launching of SPUTNIKs, and this Strategic Rocket Brigade.

103. S: Then I gave you here a list of military districts and groups of forces. First there is the Group of Soviet Forces in Germany. Then there is the Southern Group of Forces and the Northern Group of Forces. The following military districts are active: The Zabaykal (Transbaykal) military district (M.D.); the North Caucasian M.D. with Rostov-on-the-Don as headquarters; the Belorussian M.D. with headquarters in Minsk; Sub-Carpathian M.D. with headquarters in Lvov; Odessa M.D., Hqs. Odessa; Kiev M.D., Hqs. Kiev; Leningrad M.D., Hqs. Leningrad; Transcaucasian M.D. Hqs. Tbilisi - Baku is also included here; the Pribaltiskiy (Baltic) M.D., Hqs. Riga. The Northern M.D., where I mentioned these rocket bases exist which are positioned against England, has now been transferred over to the Leningrad Military District. This Northern M.D. no longer exists. It was formerly commanded by Marshal MEHRTSKOV.

104. S: The Turkestan M.D., Hqs. Alma-Ata; the Volga M.D., Hqs. Kuybyshev. You better add this, that the Volga M.D., just like the Voronezh M.D. with its headquarters in Voronezh, are now considered to be incorporated into the Moscow Military District which is being expended considerably. During World War II the Moscow Military District stretched from Kalinin to Medselinsk in the East. In fact a big section of the RSFSR was included in the Moscow Military District. That is why such prominent people I referred to before, such as BERIYA, were members of the Military Council of the Moscow Military District. The Siberian M.D. Hqs. Novosibirsk; the Ural M.D. - I did not mention it here, but it very shortly will be incorporated into the Siberian Military District - Hqs. Sverdlovsk; The Far Eastern Military District, Hqs. Khabarovsk; and of course, the MVO, Hqs. Moscow. All of these headquarters must definitely be blown up. Please destroy these slips and notes of mine later as you wish.

105. J: Please ask him to clarify the impression he received earlier that he was the representative of VAZNYUKOV and possibly others who were dissatisfied with the regime. (G. repeats question as stated by J.) S: I mentioned this before and wrote in my letter that Marshal KONEV and Marshal SOKOLOVSKIY are absolutely healthy people and are VAZNYUKOV's friends. They did not agree with KHRUSHCHEV about his policy on reducing the size of the army.

106. As your soldier I must report to you that the Soviet Union is definitely not prepared at this time for war. All of this agitation for peace and intimidation on the other hand, which unfortunately many Western leaders succumb to, provesnothing. Back in 1956 when the Egyptian affair was going on the Soviet Union should have been sharply confronted, and even today this should be done. With Cuba for example, I simply can't understand why KHRUSHCHEV should not be sharply rebuked. I do not know what answer Mr. KENNEDY will give him, but he certainly should be accused of arming Cuba with Soviet tanks and guns, right under the gates of America. Czechoslovakia also sent considerable quantities of arms. KENNEDY should be firm. KHRUSHCHEV is not going to fire any rockets. He is not ready for any war. I respect and love the United States and I certainly, in KENNEDY's place, would be firm. Just as we helped the regime in Hungary maintain its power and everyone knew what we were doing, why shouldn't KENNEDY have the right to help the patriotic elements of Cuba, when you know what arms have been sent to Cuba from the USSR! This is my opinion and the opinion of many of our officers.

107. S: I didn't finish about these Marshals. When KHRUSHCHEV found out that they did not back him, he simply ordered them retired. They are living on a pension now, just like ZHUKOV. TIMOSHENKO was also retired, but he had started to drink heavily sometime ago. Many officers are displeased because many healthy generals and officers are being retired and because of the reduction in pay they have no other means of earning a livelihood. For example, a reduction from 5000 rubles income to an income of 2000 rubles per month is very difficult when one has a family.

108. S: I would say that of the total Communist Party strength of 7 to 8 million members, there are no more than two to two and a half million of strong, fanatical Communists. If a war ever began today on the scale of Hitler's war, even with conventional armament, countless numbers of officers and soldiers would simply desert to the other side. This is because all of these ideals for which many of our fathers, brothers and relatives died have turned out to be nothing but a bluff and a deceit. There is always the promise that things will be better, but actually nothing is getting better and things are only getting worse. I swear to you that only in Moscow and Leningrad can one even purchase foodstuffs decently. In Voronezh and Orel -- a friend of mine recently came from there and said that they are eating horse meat, nine rubles per pound by old prices. Even sausages are made of horse meat and it is difficult to get bread. Since there are no roads, this results

[redacted]

#1 — distribution

in unbelievable transportation delays and breakdowns, and grain is rotting since it cannot be delivered. The country is large and can produce much wheat, but such a large percentage is lost because they cannot make equitable deliveries. Much cattle was lost due to lack of fodder.

109. S: Last December a delegation of Englishmen, thirteen of them, came to me and I was arranging to show them the refrigeration equipment of the Refrigeration Plant Mikoyan #1. They were from the John Thompson firm which manufactures refrigeration equipment in England. Suddenly I received an order to cancel this because the cattle which were brought there were just skin and bones, and they did not want the Englishmen to see this. They told the Englishmen that repairs were going on. You can check what I say with this delegation. They did not see the plant. I could tell you much more, my friends, and I'm sure you know a great deal more yourselves.

110. S: But I would like to emphasize one fact and that is that KHRUSHCHEV has not renounced war and is patiently awaiting the time when he can begin a war. He has given himself the mission of being the instigator of a war. He wants to make a "rain of rockets" under which, as he says, "to bury my imperialism". I am confident that my government-now the USA and England-with the other free countries of the world such as France and West Germany are sufficiently flexible to withstand the onslaught of Soviet rockets and arms. All will not be destroyed and recovery may be possible. But still it seems to me that KHRUSHCHEV should not be permitted to initiate the war. Today he will not begin a war. He will rant and rave and even send arms here and there just as he did to Cuba and possibly even send small caliber rockets there. In fact there was talk about this with CASTRO and possibly a few rockets are already there.

111. S: In the USSR the younger generation are dissatisfied. Their incomes are small. They have few decent clothes and when they see your tourists and your visiting delegations, and see how well-dressed the foreigners are, this has an effect on them. Our youths have no money and theft is common. All kinds of crimes for theft occur about which nothing is written. After all, the press is entirely controlled. The people cannot organize. There is no opposition to the regime, and when a small opposition does arise such as MOLOTOV, MALENKOV, etc., they are immediately eliminated. The people are afraid to do anything because if they open their mouths they will lose even the little bit they have. There is no money in the bank; there is no property, nothing from which to draw sustenance. There is internal dissension and Hitler was right when in his time he attempted to have minority conflicts. All of these weak spots must be exploited before the external blow is dealt during a war. Even the Soviet help to the countries of Peoples' Democracies may serve a good purpose in that it is draining the national treasury.

112. S: Valuable production results from our labor even though the individual worker gets only pennies. But all of these billions are going out of the country and it's becoming a serious drain. Relations are not always the best with the Satellites. For example, with China we are having difficulties

[redacted]

[redacted]

#1 Soviet aid

Although we have given them foodstuffs and equipment, recently Mao Tse-Tung chased out our specialists. He said that his own specialists have now been sufficiently trained. It can even happen that if we stop supplying the Satellites more of them like Poland and Yugoslavia will be asking you for aid. There simply is no monolithic Warsaw Pact.

Sino Soviet relations

Soviet treatment officers

113. S: Now all of us are being squeezed more and more. Even of my present 4,500, I pay 500 rubles income tax. They took away allowances for household help for high-ranking officers. They took away privileges of those who are decorated who in Stalin's time were declared exempt from income taxes. All of this is done because they need more and more funds to build factories and other equipment for the manufacture of rockets. The discipline and moral of the Army has fallen greatly. There are countless cases of pilferage, drunkenness, and immorality. All of these things I mentioned must be considered. By itself it may not be a decisive factor, but it all adds to the general situation and can be exploited. Of course, I am sorry for the people, but they have suffered so much already that if they suffer just once more for the sake of a really better future, it would be worthwhile having this war. But in that case, let me know when I should be in Moscow.

factors for rocket X army morale

114. G: Therefore, you are not the representative of any group of disaffected persons? S: No, I am all alone. All I have is my mother, my daughter, Galya, and my wife, I am entirely in your hands. You can do with me as you will, and I wish only to work with you honestly. All the materials I pass to you are mine and all of my experience and intelligence training are at your disposal. I received a great deal of training earlier from the Soviet Government. I am associated with no one whatsoever. I would be afraid of this, and I do not wish it.

115. S: Therefore, I repeat I would like to have agent comms with you via a dead drop. Please give me a small Minox. I know it and I have worked with it before. I will not develop the film even though I have my own apartment, so that my wife nor anyone else would not notice. So I will deliver only undeveloped film to you and I will place it wherever you tell me to. I have many secret journals such as VOYENNAYA MYSL, manuals, and classified lectures by prominent people. I have a chance to get these items in my hands for possibly an hour, and I can photograph them. I would not have time to write. I wrote up this rocket material because I knew it was important. I did it carefully because I knew you would check every word and if it were perfect maybe I would get a decoration. G: That's fine.

116. G: Now the time is drawing close, let us plan for the future. S: That's right. I will leave in a few minutes. G: Now what is your program or your time schedule for tomorrow? S: (Looking at his schedule) Let us begin working together tomorrow at 2115 hours. I have a little change in my schedule. Tomorrow at 1700 hours our delegation schedule will be completed and I have to run to the Embassy because I want to see if I can extend the duration of this trip by five days. As it stands, we have come here for ten days. We received money for ten days and our passport notation states that we have come for ten days. However, there will be an engineering exhibition here in London up to the fourth of May and we have no delegation planned to attend it. They wish to pass on the assignments for covering this

[redacted]

to us. Tomorrow I must go to see SOLDATOV, the Ambassador, and ask him to send a cable requesting that an extension of five days be given to myself and my delegation. This will give me the opportunity of working a little more with you, to get to know you better and to rest up a bit. I do not know whether this will work out or not. In the meantime you must plan that I would leave on the 30th because there is no permission to extend as yet. G: When do you think you will know? That is, when will a cable reply come in? S: I will know about the decision on Monday.

117. S: In addition we want to see what the firms Plessy and Leo Computers can show us because they deal with electronics which is now a first priority, and it would be an advantage to report even on some new screw. Things are not sufficiently developed in electronics in the USSR. Some work has been done and they have various integrators and computing machines, but it is far from perfection. You have no idea of how many failures and unsuccessful tests have been made. The Americans are honest people. They write about their test failures and admit when a rocket falls into the sea improperly. We don't write anything about this but, believe me, we have more failures than the Americans.

118. S: Well, this is about all I had planned to tell you tonight. Possibly much of what I have said did not follow in proper sequence. However, I hope that next time we will continue our talk with more concrete details. What I would like to do is to look over the materials I have submitted and explain whatever may not be clear and pinpoint details.

119. S: Now with respect to the agent net -- in Ceylon there is this diplomat who is working for the Soviets. His father is a Kurd, which fact he conceals. I have the names and addresses of all people. It is hidden in a dead drop which I have at a DACHA. It is the DACHA of my uncle; it is a little place. This uncle is my mother's brother. In the dead drop I have this list of agents, which includes the agents in India who are on conservation. There are two brothers there. Formerly, they were very active agents, but now they are on conservation because we are not conducting intelligence operations against India. This is because NEHRU is a fool and says everything anyway. In fact, the entire government is that way. There is a radio operator in this REZIDENTURA which is on conservation, and in addition to the two brothers there is a Major in the Army and other military men.

120. S: In Pakistan there are six agents, one of whom is a Turk, and there are two agents in Ceylon. In Ceylon one of the agents is a corporal who works in a headquarters. He obtains all kinds of United States military manuals. All this material I will pass to you. Don't forget to prepare a set of photographs for me to identify. I will tell you whom I know about, and who are dangerous intelligence officers who should be gotten out of the country. Any means should be used to expel them, including provocation, intensive surveillance, etc.. Let replacements come in because it

takes a considerable time for a man who just arrives to do anything.

121. S: Incidentally, there was an important moment I want to tell you about. Yesterday when I was leaving I saw MELIKH in the General Staff. Why did you let him go? This is something I do not understand. He is an out-and-out intelligence officer who has even been an instructor in English. I studied English under him. Yesterday I saw him just before flying here.

122. S: Another important matter, and please give this attention - please contact all people who have had dealings with me and make them sign secrecy oaths to preserve my security. Last August I was in Odessa on leave with my wife and daughter. On my way back through Moscow from Kiev I found myself in a railroad car in which were American students and instructors in the Russian language, also Americans. I could not approach them because I knew that there was an Armenian with them who is a KGB informant. For some time I stalked the American Embassy like a wolf, looking for a reliable foreigner, a patriot. Across the street from the American Embassy there is a tunnel-like archway and two benches. I sat there for a long time smoking. There were two militiamen walking around. One was at the corner. Dozens of cars were coming out of the Embassy. I even went to the America House. I saw them playing cards there and drinking whiskey, and there was a militiaman at the entrance. I was waiting for some American to come out so I could contact him and say, "Mister, you are a patriot. Please deliver this letter to your Embassy. Everything in it is self-explanatory." I couldn't meet anyone. No one came out.

123. S: These two instructors, one was tall and one was short. G: They delivered everything properly and you can see here your original letter. S: I had noticed them in the railroad car and remembered their appearance. I arrived in Moscow on the tenth of August and on the twelfth I spotted them as they were walking down to the river from Red Square. The tall man had an umbrella since it was raining. They were going to the bridge and I approached them. At first they were frightened, but I spoke to them at length and told them what a coincidence it was to see them again. They spoke Russian very well. I was so interested in the conversation, that, as an intelligence man, I made an error. I didn't say farewell to them. I had already given them the two envelopes, and it was high time to end the conversation. As we approached a PERVIAK, I saw two militiamen by accident. One was talking to a woman, and the other was walking. I told the Americans to go with me to an entrance way so at least we could say farewell and I could shake their hands, but they were frightened and started to walk away.

124. S: So I didn't say farewell to them, but they kept the envelopes and on the 15th of August they departed from Moscow. My feeling was miserable. I went to the dead drop; there was nothing there. There was also no signal on the booth. I have a friend in Moscow who is an Armenian. I told him "Leva, come with me to a hotel. I am looking for another Armenian

who was on a train. First I went to the Budapest and then to the Balchuk, on the pretense that I was looking for the other Armenian. At the Budapest Hotel we were told that no Americans had been there, but at the Balchuk, again using my Armenian as a cover, I found out that the Americans left Moscow on the 15th of August. After that I walked around for months and there was still nothing.

125. S: Earlier that Summer they had assigned me to the commission for accepting students to the MDA. At first I was to be the chief of the incoming class, but later was told that this is not compatible with my background, that is, my father's having been a White Russian officer. Then I was transferred to the Committee. But in the meantime I was writing up all the data on these students from their personnel files. There were many who came to Moscow from foreign assignments, and there was one illegal. I will think of his name in a minute. G: He is SHCHERBAKOV. S: That is exactly right.

126. S: After this, in December, the WINNE delegation came; [redacted] They were elderly people. I decided to approach them. I was determined to get all of this information as fast as I could to the American and British governments. I was undecided. You notice that at first I wrote the letter when EISENHOWER was president. I didn't rewrite the letter later and I added, you can see, the addressees, Her Majesty Elizabeth the Second and MACMILLAN. I approached them in their room at the Leningrad Hotel and appealed to them like to my fathers. I asked them to help me and simply deliver this letter. If Col. PEKKE had not departed from Turkey I probably would have established at least a contact to whom I could go when the time came. [redacted] were frightened. They said that they would consider it, but did nothing. They know about me.

127. S: In January, the Canadian, [redacted], arrived. He is acquainted with [redacted], the Second Counselor. I thought of [redacted] since he had a diplomatic passport, whereas [redacted] had a civilian passport. I asked [redacted] to introduce me to [redacted] since [redacted], as a Commercial Counselor, had official dealings with our Committee regarding scientific-technical matters. Therefore, I approached [redacted] and told him to please deliver my letter, to be a patriot; that to tell me down the river was in his province to do, but what would he get out of that? He took the letter, but two days later when I met him again to give him the package with all this rocket material, he returned my first letter. He politely, but firmly, told me to go. He said he was not concerned with such matters. A month and a half ago he received a new apartment in Moscow. I went to a reception with my wife and took all my material with me again. I met [redacted] and thought maybe he had thought the matter over and would accept the material. He greeted my wife and myself and then stayed away from me during the entire time I was there. I also request, therefore, that you obtain a secrecy agreement from them and request that they

[redacted]

forget all about me. These are the paths along which I meandered like an animal in order to make this contact. Now I thank you for this very much. Don't forget the Minox camera.

128. S: I request that you evaluate my submitted material with respect to its financial worth. I am certainly not going to bargain about it, and I am a soldier. Whatever you determine I should get, I will accept. Please place whatever you decide in the bank and I will request small sums as I need them. During this trip I will ask you for some money, not this minute but during my stay, since I have to buy quite a few things. Some of the things I buy I can take with me. I can even take two suitcases with me if it is necessary since it is entirely normal, or I can leave one suitcase behind with WYNNE and get them from WYNNE next time he comes to Moscow. I have many purchase orders to fill for my friends, my wife, etc.. I have complete trust and know that you will decide this properly. Basically, those are all my requests. G: I am sure everything will be arranged accordingly. S: Fine.

129. S: Well, these are all my requests and please now consider how to establish a system of dead drops. I think that we can arrange all this prior to the 30th of April and it seems that there may not be any reason making it necessary for me to meet with someone until five or six months after this. G: Are you planning to possibly return here again in the Fall? S: You see, that all depends. Tomorrow I will tell you all about my mission here and what data I have to get in terms of certain catalogues, so that they would see that I have obtained something and brought it back. Then there is another mission, that of turning over some of my acquaintances to local contacts. I will tell you all about that tomorrow. I will ask your advice and possibly your help in some of these matters. Then it all depends on how all this will be accepted at home. If they trust me, they may even send me with my wife and family overseas. This could be to the United States, to England, or to Canada. By my experience and maturity I am eligible, but it's a matter of whether they trust me.

130. G: How about your mother? S: No, they would not let her go. You will have to help me arrange how to get my mother out some other way. G: Could she get to the DDR? S: Yes, it is possible that she could go there as a tourist. G: In that case it will not be a difficult matter to get her out through East Berlin. S: That is a possibility. I have another possibility in mind. After I have completed all my assignments for you in Moscow, I could go with my family to live in Riga or elsewhere in the Baltic States. Then I could get out either by submarine or surface craft. This may sound naive at this point but it is still a possibility. G: It would be much better if she could go as a tourist to East Berlin and then simply get to West Berlin. S: Anyway, think about this. The only other thing I want to mention is that you will be satisfied with me. G: We are sure of this.

131. G: Now let us arrange about tomorrow. S: I believe that I can meet with you again tomorrow in the evening, late, between 2100 and 2200 hours. That would be the best time for me because the others will already be tired and will be falling asleep. G: Can there be any difficulty for you from anyone in your delegation? S: No, none at all. I am perfectly sure of this. Tell me, what danger do you think there can be? G: We don't know the exact circumstances, but we are afraid that if a pattern of your disappearance is noticed, someone will report this to your people. S: Nothing can happen. My room is locked. Here is my key. If the phone rings there will be no answer, and I will simply say that I was asleep. G: Suppose they keep knocking loudly on your door? S: First of all, there are double doors, and secondly, why should anyone knock on my door? I said goodnight to them quite properly, and said I would retire. I am positive none of them are surveilling me. G: We are raising these points entirely for the sake of your security. S: That is fine, and you can say anything with respect to matters that I am not aware of. But these things I know, so far as my delegation is concerned. G: We certainly are most happy to meet with you as much as possible. Don't misunderstand. S: I believe that we can work during the night. Tomorrow I will come here about 2200 hours. G: Yes, come straight to this room. S: This is about all I had in mind to tell you tonight.

132. G: Now I would like to be completely honest in my relations with you and I would like to formalize our relationship by an official AKT, so that you can properly report this to your top people. I will sign all necessary obligations, oaths, etc.. I want to have a clear soul, that I am doing this irrevocably for my whole life. These are not impressions as the result of one day. After all, I felt these urges far back in the days when I was in Turkey. Maybe the Turks even suspected, although I was never identified to them by name. Now that I've waited patiently almost one year, God has granted our getting together. G: That is why no further unnecessary chances should be taken from now on. True, God has protected you so far, but there is a limit to taking chances. S: Yes, God does not bless fools. G: No matter how much we want to meet with you for long sessions and often, we must be careful.

133. S: I asked WYNNE when he was leaving on the plane. I gave him my letter and one document. If he had taken all of the material you would have had a chance to examine it by now. It would have been important for you to have studied this earlier in order to have saved time, since there are many items there and no doubt many questions about them. After all, there are all kinds of details about the technical equipment, the organization, etc.. After all, these were not notes from lectures. The material was directly copied from written lecture material and from manuals. These were all Top Secret, of special importance. I put them into a briefcase which was carried in and out of the building with a special PROPUSK.

134. S: Well, then, let us say goodnight until tomorrow. Tomorrow I will come as soon as I can, but it may be as late as 2200 hours. G: Come when you can. We will be waiting for you. Let me take you out and show you a rear stairway of the hotel, right across from this room. You can go right up to the fifth floor without being seen by anyone. This will avoid taking the elevator. (Subject was given his key #566, and G. escorted him to the stairway. Subject left about 0103 hours, 21 April 1961.)

Addendum to Meeting Number 1

During the time that the tape was being changed during the First Meeting, the information below was not recorded on the tape. Fortunately, Subject had presented his agenda notes.- The items thereon having fallen within the short space interval of 3-4 minutes during which recording was not possible. This situation was inevitable due to the fact that at the very First Meeting with Subject, the tape recording was made clandestinely whereas, with Subject's concurrence, all tape recordings for future meetings were made with his knowledge. No business matters were covered during the short periods when the tape required changing. The following items follow Paragraph 89, Page 27, consecutively and precede Paragraph 90. Therefore, they will be numbered 89A, 89B, etc..

89A. There are rocket launching sites established in the area north of Leningrad toward Murmansk. Exact locations are unknown but these are in the Murmansk OBLAST.

89B. There is a production center and a warhead explosive storage area at Shchakhtinsk which is 180 KM from Rostov-On-The-Don. These warheads are specifically for the TRA which is the heavy rocket artillery for the Ground Forces Rocket Command under VARENTSOV.

89C. At Glukhovo (from Moscow) in the direction of Konotop, there is a training center for officers of the Rocket Command.

89D. At Kuzhenkovo and at Staryye Toropy, there are training centers for cadres to handle all types of warheads for rockets. These are for enlisted personnel rocket teams.

89E. In general, all training with live rockets has resulted in numerous casualties. The most notable of which was the explosion in which NEDELIN was killed.

(10)

Meeting #2, 21 April 1961

1. Subject arrived at 2125 hours on 21 April 1961. Immediately following hasty greetings Subject sat down and began to report on his visit to the Soviet Embassy earlier in the day. He had spent the early hours of the evening after supper with SHAPOVALOV, a GRU officer in the Soviet Embassy and admitted having consumed a half bottle of cognac with SHAPOVALOV. This was quite evident as the meeting progressed in that Subject digressed from his main thought even more extensively than usual. This is the only meeting, however, in which Subject showed any sort of alcoholic influence and he certainly was not intoxicated even at this meeting. As a matter of principle all participants decided to serve only a mild wine at meetings. This served to quench thirst which was stimulated by being forced to sit in a hot, stuffy, smoke-filled room for hours. (The windows had to be shut to keep conversation from being overheard.) Subject said he went to the Soviet Embassy to see the RESIDENT.

[redacted]

Georgadze

of the Presi.

APPROVED FOR RELEASE
31 MAR 1992

[redacted]

5. G: Do you remember you said it would be interesting for you to get this Nemonic #105? S: Ah yes, I'll tell you about that. Nemonic.... the firm is Henry Higgins. G: How did you think you would make up a cover story for getting this material...a fairly small quantity...150 grams? S: I'll tell you about those intelligence tasks which I fulfilled in my position as a worker on the Committee (GWIK). I'll tell you about the members of WYNNE's delegation on which they wanted character details -- those who live in London -- so that it's easier for a member of the RUKOVODSTVA here to work with him and later perhaps to recruit him. I mentioned three people in my operational report on the visit of WYNNE's delegation to Moscow in December 1960. I gave you a list of the seven people who were there.

6. G: Would it be a good thing for you if you were able to get the material? S: This is what I think about it. I'll tell you the tasks I've got to fulfill. If I can fulfill them, this would strengthen my position considerably, because it's worse to do none of your allotted tasks. I've been given four tasks and if I can do them all, so much the better. If I can fulfill just two of them I shall have done well. If I do none of them, they will either say "he's lazy" or "he doesn't want to work with us". G: (in English) Should I ask you if we can help him extend his stay? H: I wouldn't at this moment.

7. G: (in English) Shall I ask him to analyze his mission now? H: Yes. G: Tell us about your mission here. S: After WYNNE's delegation left in December 1960, I wrote an operational report on the operational task which I had been given, that is, to report on the people I met under the auspices of the GWIK. They told me to cultivate the acquaintance of people, to get on good terms with those who lived in London, or not far from London, or in a town near London, because our people here have to get permission to leave London. G: What sort of man were they looking for, a businessman? S: Yes, but it doesn't matter because every Englishman or American has, in our opinion, some possibility or other as an agent. Even if we don't use him directly we can get in touch with other people through him, select those who are of interest to us, and give them money. We don't give much. G: In other words, a contact or a spotter. S: I give you my word that I got into no agent relationship with any member of WYNNE's delegation. Quite the opposite, since I approached [redacted] and [redacted] with my own problem, with my own life.

[redacted]

[redacted]

[redacted]

9. S: Now then, what tasks did they give me? To study these acquaintances again; to get to know them better; to work with them, estimate their value as agents, and if they have any value to report to the REZIDENT in London about their possibilities. The REZIDENT would assign an operational worker. His operational worker is Colonel PAVLOV. He is the son-in-law of VOROSHILOV. He is temporarily at the Center in Moscow at this time. Or he might allot SHAPOVALOV, who has a large mole on his right ear. He used to be a secretary in the APPARAT of the military attache in India. He's been in London six months. Or he might assign some other operational worker to the job.

10. S: I am to arrange a meeting with him and we might have a drink and so on. Then a further meeting would be arranged at which the Englishman's weaknesses would be explored -- perhaps he might be in debt, perhaps he might need money which he had lost gambling, etc.. He might ask for money himself. It might be possible to take advantage of these weaknesses, compromise him and eventually get him into a compromising position for recruitment. I should like, that is, another mission assigned to me is to make some new acquaintances, perhaps in the firm of Leo, to remember them and to report on them. Today the REZIDENT said to me that I should look out for new acquaintances at the Exhibition of Industrial Engineering and report on them to him before my departure, but about three days prior to my departure so that he can assign a case officer to whom I would introduce my acquaintances.

[redacted]

[redacted]

13. S: My second task is to determine the methods used by British Counterintelligence against me and my delegation, who is put on to us, any provocative questions, any anti-Soviet propaganda, surveillance methods on foot or from vehicles, the use of radio to report our progress from one block to the next, for instance, down Queen's Street. Those are the sort of things I should write about. Well, I'll write something.

14. S: The third task is the Nemonic. I told you about it yesterday. Incidentally, gentlemen, that reminds me, I thought about this in bed... I didn't sleep for two hours...today or tomorrow we ought to go through all my material and decide how you can use it freely -- through the press or through notes or however you like -- all the KHRUSHCHEV business and so on, but only that material which does not involve me.

15. S: I'll give you details on fifteen Soviet agents working in three countries, but don't arrest them now. Don't even put surveillance on them. Somehow we must cut them out in such a way that it won't do us any damage. As I said, in Ceylon a corporal is handing over all the American documents (USTAVY) for money. He has three children and needs money. He is not paid much but for him it is a material subsidy, according to his standards. But if you put this corporal in prison or shoot him as he deserves, then they will look at his file straight away. He has a pseudonym, "DICK" or "BOB", etc. and all the officers of Strategic Intelligence who have had dealings with him are listed: (Subject's true name), IVANOV, PETROV. They are called in and interrogated, has there been a leakage from these people who know that this man is an agent of Soviet Strategic Intelligence -- military, I emphasize. Therefore, this is a two-ended stick.

16. S: In India everything is frozen. They are not working now; they are on conservation. In Pakistan they are working, but producing only trifles. It is true there is one man getting material on computers (SECHETNO-RESHAYUSHCHIM USTROYSTVAM). He has access, but as I understand it, he is working through someone. Someone gives him the material as if he were interested in it, and this man sells it through a third person. The rest are worth nothing. They produce only scraps, nonsense. The material from Ceylon is valuable. It is always highly evaluated by the Information Directorate -- American documents, orders, and so forth. Incidentally, this government of Mrs. BANDARANAIKE is unsuccessful. It may be necessary to find a new regime. They are going a long way to the left. That is my personal opinion and I have the right and the duty to say these things. Well I ask you to think about all this and to come to an analytical, non-primitive decision, as one might say.

17. S: My next task is to get hold of as much information and material as I can which will receive positive evaluation. Incidentally, when KIRKWOOD was in Moscow, he gave me an overt brochure about obtaining fresh water from sea water. There are these evaporators. Our specialists were very interested because the methods we use to obtain fresh water -- this is in the Far Eastern Theater -- water for food, for drinking and for equipment, and water to drive equipment and tanks and so forth.....by our method the cost is six rubles (old currency) per cubic meter, but your method costs either one ruble five kopeks or ninety-seven kopeks. I don't remember exactly, but it was six times

cheaper. I got a good evaluation for this overt brochure. These types of visits give so many opportunities to our heavy industry, metallurgy, machine building, chemistry, artificial rubber.

KATZEL

18. S: Our specialists still haven't been able to work out how to fix artificial fur onto a fabric backing. In America there is a firm called Kapsel and in Canada, the Lion Fur Corporation. This Kapsel Company not long ago offered us a machine for doing this for $300,000 U.S. dollars. The factory is in Montreal and on the 15th of May three people are going to Canada to evaluate this machine -- two specialists and one interpreter. The name of the interpreter is NOZHIN and the head of the delegation is SAPZLEVSKIY and the third is a woman who is called KLYAKINA. I think, and this is my opinion, we will not give $300,000 for this machine but we shall study the process and perhaps steal the secret of the adhesive which sticks the backing to the fur. Why give $300,000 for a machine? Engineers, academicians, chemists and people like this are stealing all this from under your nose all the time.

19. S: I think the Americans do this the right way. They put very strict limits on the things these people can see. They show them very little. Our people go to Canada and we consider Canada a synthesis of the top scientific and industrial thinking of both the U.S. and Great Britain. The Canadians themselves have some clever people but they are working with American or British machines. You don't allow us to come to America and you don't allow us to do everything in England, but in Canada we go very freely and study them. We describe all the secrets and we say, "Thank you for letting us have everything so cheaply." The reports our scientists submit must be accurate or they are reprimanded. Irrespective of how the individual feels, even miserably, one has to do these things in order to survive in our system.

20. S: Well then, my task here is to get hold of materials which will be of interest on all those firms which have invited us. You, I think, should help me get this material without doing yourself any harm, of course. I won't be putting this material in my suitcase -- those are my orders -- but I shall be sending it back in the diplomatic bag through the REZIDENT, addressed to ROGOV - the small ROGOV. I've got it written down here, Vasiliy Maksimovich, not the Lt. Gen. ROGOV who is deputy to SEROV.

21. S: That's my third task, and the fourth is the Nemonic. This Nemonic, why give it to me? I don't think it necessary to give it to me. Why hand it over for chemical analysis -- or perhaps this is impossible. I'm not an engineer; I don't know. The REZIDENT said to me today that there are many Nemonics, 85, 120, 105, etc.. Through British Agents who are working for the Russians, they've gotten hold of one Nemonic -- which one he didn't know -- and he sent this off to Moscow by diplomatic bag on 17 April. H: I think that was Nemonic 90. S: Was it? I didn't know that. I'm only telling you what the REZIDENT told me.

22. S: I thought you would be bringing me photographs from which I could identify the REZIDENT. He's forty-five or forty-six. G: Yes, we'll get them for you. They're being prepared at this moment. I will have them for you tomorrow. S: I think this is a very important business. Yesterday you asked me to name all those officers with whom I studied. I will name all whom I studied with. There is this YERMOLENKO. You asked me about who worked as an illegal. He was in my class. Of course, he's gone abroad under a different name which I don't know, but I can identify his photograph, you understand? I will show you hundreds of these people and I won't make a mistake. I have a very good memory, but I did not want to clog it with a man's name and patronymic. I can tell you their ranks and surnames. You must do this now since we may not meet again for some time in the future. I'll show you which of them should be thrown out of the countries they are working in, so they'll have to bring in new ones. I will tell you about my classmates and graduates of other years. Incidentally the REZIDENT here used to be in America, and then he was sent to England.

23. G: Are those all your tasks? S: Yes, that's everything. G: Our question to you is whether if you fulfill these tasks, would it be a great plus for you? And if, perhaps as a reward, they would send you abroad again with other delegations? If so, this is the aim we should set ourselves. Exactly what would help you must be explained by you since it is clearer to you what would be most effective. S: If I do nothing, they'll say that I was just idle, that I came here only to see London and Great Britain, and to drink wine with the firm which gave us receptions.

24. G: We'll look into this. H: This is quite easy. I can get all the brochures he needs. S: Well I'll send the brochures by diplomatic bag through the REZIDENT, Col. ROGOV, not to the Committee, but straight to the Information Directorate, the former Second Directorate. H: Well, this is quite easy. I can get you stuff from all the firms. G: We're talking about the brochures. S: Yes, I want catalogues, valuable looking things with drawings, interesting things -- you know the sort of thing. G: We'll get you a whole heap of brochures. You can look through them and pick out the most important ones. S: Those dealing with electronics are the most useful if you can get them without damage to yourselves. At the Leo Factory they gave us a description of the Leo, II . Our specialists are very pleased with it. Today one of our specialists gave a lecture on the machine Minsk-1, the computer. Your specialists were not particularly interested. It was pretty old stuff for them. This man LOPATO, of course, knows a good deal about various big computers (STRELA) and the STRELA-4 which are kept in secret. (Note: These are Soviet models.) So I ask you to think about that and I ask you again to put me in touch with somebody suitable who could work with me properly. Later I can introduce him to a case officer of the REZIDENTURA here.

25. S: Do you understand how the list of code names I gave you is used? For example, 'yesterday I concluded a deal with Merchant B'. This means yesterday I had a contact with Agent B. This is how a dispatch or cable is

written up. Recently two couriers were killed. This happened not long ago, a few weeks ago. Sometimes they burn the pouches with this material and sometimes it may be intact. You may be able to intercept a diplomatic bag and, if you can do this, there you will find all the documents of Strategic Intelligence encoded with the code which I gave you. For instance, a "Merchant" is an agent, etc. You understand, when they are enciphering a telegram they use this code.

26. S: First of all, they disguise the operational words with this code and then with the help of ten-line figure ciphers, they encipher the message and send it off. (Note: This is a one-time pad.) In Moscow, they have a corresponding book and if in Ankara they subtracted, in Moscow they add, and get the true meaning of the message. So in order to decode a message, we need a code book which is kept in a safe by a code clerk. But, for instance, when I was REZIDENT I had access to the codes and did my own enciphering without the help of the code clerk. We've got these books at the Center. When I was getting ready to go to India, I went through all this in a separate room, and so forth and so on. It's important that we photograph two or three pages for the experts so that they can understand the order and frequency of the number sequences, and try to discover whether there is any higher mathematical rule in the structure of the whole. This is my future task which I will do when I get a suitable chance.

27. G: When you use the figures in order to send a message either by telegram or by some other means, surely you do not repeat the figures a second time in another message? S: No, because I subtract the numbers from another pad, and those sheets on which I've already crossed out numbers are burned in an incinerator by certification. In each REZIDENTURA there is a cipher room, in England and everywhere else where there is an oxygen tank and a device for the rapid destruction of cipher material in case of an incident. That is the general rule. G: What do you call these tables, one time tables (ODNOVREMENNYE TABLICHKI)? S: No, these are called RAZOVYE tables, on thin cigarette paper. (Subject gives an explanation of the system by which a word is encoded by syllables in alphabetical order; for example, the RAZVEDCHIK is encoded syllable by syllable.) S: And when I take the RAZ, 45855, I take pad No. 1 or I take pad No. 7, and they use pad No. 7 or No. 1 in the Center because they know which pads I have destroyed. Where I have subtracted, they add, and vice versa.

28. S: The operational code that I gave you is a fresh code (SVEZHIY). It is used in all REZIDENTURAs. It's a red booklet. At the beginning is the encoding section and at the end is the decoding section. It is in alphabetical order like a dictionary. I gave you some examples. I copied this booklet early in the mornings or when I was on duty. I kept it in my safe. I kept it together with my ciphers. But only this one code which was intended to make operational letters secure so that there were no words like intelligence officer, agent, safehouse, or dead drop. For instance, if I wanted to write Rome, I wrote "VILLONA".

29. S: I copied this list out on a piece of paper and then typed it out on a typewriter which I got from Germany when I was a regimental commander. I did this as accurately as possible. I wanted to insure that it was done more tidily than what I write on rockets, although that too should be comprehensible even though it is not beautiful. I tried to write out all the words in toto. I did want to copy the whole lot out on a typewriter but I would have needed two months to do that. My wife kept asking me what I was typing...we live in two rooms...and I always told her it was just a report, or (I would type) when my mother went off to my uncle's DACHA with my daughter. If I had had a camera -- a Minox or something like that -- then I certainly could have done it. G: You know how to use a Minox then? S: Of yes, I know how to make microdots, how to use secret ink, and I know how to develop secret-writing, that's all.

[redacted]

31. G: Have you eaten yet? S: Yes, I ate with SHAPOVALOV, with intelligence officer SHAPOVALOV. His English is very bad; mine is better. The REZIDENT was complaining to me about him today. The REZIDENT is an experienced and cunning man. He was in America. Incidentally he intends to take a TDY trip after PAVLOV, his deputy, arrives. He's going to go all around the country and if you put heavy surveillance on him he'll report on it to the Center. He'll begin to wonder why because there wasn't surveillance on him before, but since (Subject's true name) was here, surveillance began. You see, he'll get suspicious. Perhaps, on the other hand, he won't think about it.

32. S: Now we'll go through the papers which I have given you. I'll tell you what you can publish tomorrow in the papers if you like or in notes or on the radio on the "Voice of America" or on the "Voice of the BBC". Let's begin with the question of YERZIN, Pavel Dmitriyevich. I used to drink wine and vodka with him in Ankara. He was the KGB REZIDENT. He was a colonel there. Now he is the Prorector of the Peoples' Friendship University in Moscow. Incidentally, this University is in the building only recently occupied by the General Staff Academy imeni Voroshilov which is now being united with the Frunze Academy. It is not far from the crematorium.

33. S: Let us suppose it would be possible to expose YERZIN and to show these stupid Africans like Patrice LUMUMBA who are being prepared as a fifth column. Many of the students there have been recruited already. They take these people there who are poor and enraged, feed them, give them money and recruit them. They have lessons and Marxist-Leninist training, develop their political views, get a signature from them for material assistance and send them back to Africa to stir up trouble for you -- strikes, revolutions, etc. This university must be unmasked, and we can do this through this YERZIN

[redacted]

who is both Prorector and KGB REZIDENT, and who studies the prospects and does all the recruiting. Some have already been recruited. I heard this and believe it. However, if YEVZIN is exposed they would say, now who knows YEVZIN? A hundred people know that he is a KGB officer and on this list, of course, is my name because I worked with him in Turkey from the beginning to the end of his tour. I was with him for eighteen months. So I should like to unmask him but I am apprehensive about it at the same time. I had all this material ready at the time KHRUSHCHEV came to America and I should have liked to have been able to produce it then and to confront him with it and to say, "What are you doing?"

34. (Subject then gave a rambling monologue on political conditions inside the USSR with particular reference to the hunger strike in Voronezh reported in the written material.) S: KHRUSHCHEV should be confronted with specific instances of bad conditions within the USSR, of which he is fully aware but pretends otherwise. I wrote all this up. Now the individual KOLKHOZNIK's right to have a cow has been taken away. The order was given that the cows were to be taken to the KOLKHOZ. (Subject described miserable rural conditions -- no roads -- impossible to gather in harvests -- and the KOLKHOZ system completely failed.) G: Let us continue systematically. S: Please excuse me, my nature is such that I get carried away. I am afraid of forgetting when a thought comes into my head. (:))

35. G: All that you say is very interesting and clear and no one would quarrel with it. But our agenda....S: Excuse me before I forget, yesterday I began to tell you and I should like to emphasize this -- on the newspaper photograph which shows BIRYUZOV's headquarters, the PVO, and where I said GAU was -- Colonel General ZHDANOV of the Artillery is the head of the GLAVNOYE ARTILLERISKOYE UPRAVLENIYE which is the soul and heart of the rocket artillery and of what remained of the classical artillery. The place shown is the largest Chief Artillery Directorate under which are concentrated control of electronics, the production of all military rocket factories and the storage dumps. I ask you to remember that this building must be destroyed. It is the center where the planning and direction of the technical military machine is concentrated and control of the technical production.

[redacted]

37. S: Insofar as the agent situation for our workers in the countries I deal with -- now my adopted countries -- it is complicated. It is not particularly easy to work in them. AGENTURA is thin and in America -- and I will talk about America in particular -- at this moment there is a REZIDENTURA which

[redacted]

has direct contact with the center. It is illegal. The radio station is not outside Moscow like the station which received cipher telegrams from all countries but is directly on the Arbat in the General Staff. There is a powerful station and the agent and illegal REZIDENT whom they have sent off is in independent contact. They train radio intelligence workers. In Turkey I had GUS'KOV. He is now studying at the Academy. Nikolay... he's taking part in the first course of specialists.

38. S: We have two types of radio equipment which are sent out to our REZIDENTURAs -- large powerful sets and smaller sets. We set up large sets on the frequencies on which our radio stations originate and receive cipher telegrams, and this other smaller set listens in to the channels used by the Air Force and the PVO and to other military channels. If the message is of a civil or commercial nature from one town to another, let's say from Ankara to Istanbul in Turkey for instance -- that was where I had a radio station under my control -- he there changes the wave length and searches. He listens to all the channels used by aviation etc. transmitted by bases, as I remember it, and all the other channels. He intercepts them and he records or writes them down, or he makes a digest or a transcript of the conversation.

39. S: In this way they get a great deal of factual material. He can pinpoint deployments exactly because there are very many careless people, officers and others who give numbers in open text or ciphered numbers which can then be deciphered and understood. For example, an intelligence worker may go for a walk or go fishing and meet a soldier. He stops to talk and smoke a cigarette with him and asks him, "What unit are you serving with". The soldier says, "Oh, I'm in the 65th Infantry Regiment." Well, they have a different number which they use on the air, but we know that this is the 65th Regiment. The fool told us. In this case the agent would not say that he was a Russian. He would pretend to be a Yugoslav which is also in the Balkan Pact, and the fool soldier would believe him. This is a terrible business, your task and mine. Perhaps other people more experienced than you are in thinking out how to curb Soviet Strategic Intelligence, could figure how this could be done. This I can't tell you at the moment.

40. S: One thing I can tell you about is this is work with small radio transmitters which are carried in operational cars. Every REZIDENTURA has these operational cars. For instance, in London there are many. The car is specially equipped. The REZIDENT told me that your counter-espionage services have sometimes stopped a number of these cars and checked them. They are doing the right thing, but it is necessary to know what to look for and how to recognize them. This is an important matter. They are connected with radio intelligence. These cars should be confiscated. That is my opinion. Operational cars are given great significance.

41. S: Contacts are made, as a rule, in operational cars nowadays. Agents are picked up en route when the cars have shaken surveillance. Money and materials are passed and the agents are dropped off. You can stop the car and you would not know there was secret material in it. In a car there are a large number of places in which one can make hiding places. For instance with the upholstery, like the arm-rests, you can take off the upholstery and make a small cavity. You might have one already made in which there is a small pipe in which a cassette, like a film cassette, can be put containing material which is being taken from or given to an agent. There is an invisible cavity into which a flexible hose with a special head can be lowered. It screws onto the container hiddan there. This is made by the First Section of SHELYGANOV. More and more they are using the gas tank with a false section. They are even fitted out to enclose radio transmitters. They make a cavity inside the tank, completely sealed off, and they put the transmitter in there. Also, under the floor where the plating is, they use all the projections and exhaust pipes and portions of the car chassis as concealment devices. You must look very carefully, especially for places out of the line of vision, as I described.

42. S: To continue, they drop off an agent as the car moves. A switch turns off the brake lights as the driver brakes and no red light is seen in the rear. The surveillants think the car is moving, but he has stopped and unloaded the agent in the darkness. The stop signal had been disconnected. The same can be done with the interior lights when necessary. The door opens and normally the light goes on, but it can be disconnected so that when the agent is picked up or put down the car remains dark.

43. S: Operational cars, particularly foreign models, are kept at the AVTOBAZA on Gritsevets Street, the AVTOBAZA of the GRU. Yes, there are special instructors, drivers who have worked abroad, and they teach courses to new drivers and sometimes teach us. I studied there. I did thirty hours. I know where there are hiding places in the Pontiac, the Ford, the Mercedes Benz, for example, I told you the floor, and the arm rests. In front where the driver and the passenger sit, the floor opens up and there is a hole underneath. Sometimes when a car is followed, material can be jettisoned. If they held me up I could throw the material out. I throw the stuff out; I am picked up; I have nothing in my hands. They throw stuff out; they drop it. Therefore the cars are adjusted so that when the car stops or brakes, there is no red light at the back. The car is dark when picking people up or dropping them off and there are many hiding places. An operational car -- all operational cars -- are equipped like this. But such ingenuity! They take off the metal upholstery holders and make a hiding place. You would never guess that there is a hiding place there. You look at the outside surface under the seats. You must take the plating off and there you will find the hiding place. Knowing who the operational case officers are, you can spot their cars.

I just left SHAPOVALOV. He brought me here. I wanted to get the number of his car but that's easy for you to find out -- that's no problem.

44. S: On the question of radio intelligence -- great significance is attached to this. We have it here too. In the Embassy there is a powerful station which listens in to all of the channels. In all the capitalist countries there are huge stations and little portable ones. They switch on the station, search and listen to the channels, pick on one far away from the town -- a base or a storage area which has a radio link. They listen to it, write everything down, locate it, work out its designation and the matters which are being worked out. They hear very interesting, secret things. Thus without agents we obtain precise details from radio data about the location, about the formation itself, about those questions which I had on record -- that supplies are running short, that they have not delivered produce for three days to that division. We know its status. They transmit by radio -- here is Balikashyr, there is Samsun or Trebizond. Well, this is a very great asset of strategic military intelligence.

45. S: KGB intelligence also uses the facts which are obtained by radio intelligence on the subjects which interest them. What does the KGB do? They do surveillance of us and of all Soviet subjects and political intelligence. What sort of organization do they have? There is the First Directorate -- this is operational -- on Dzerzhinskiy. It is necessary to smother the KGB. They are very experienced people and they do a lot of harm to good people. It is a terrible business, a huge organization, flourishing and rich. They get large salaries -- more than we. Well, they also use this data. The First Operational Directorate (of GRU) is also split into sections (OTDELS). All our directorates are divided by areas, but theirs are divided by sections which are working groups against countries. Also in the sections there are directions (NAPRAVLENIYA). There are senior officers who are the heads of directions; that is also the organization in strategic intelligence. There are no sub-sections (OTDELENIYE). In the Directorate there are sections. But there, a section is divided into directions while with us a directorate is straight away divided into directions.

46. S: A head of a direction -- . Say in the Fourth Directorate there are three directions. Colonel ZASORIN, Konstantin Alekseyevich is the head of one. He was military attache in Syria -- you must know this. The other two are headed by Colonel DOLIN, military attache in Iran, and Colonel BLAKHIN. He was military attache in Syria after ZASORIN. He was there a long time. Those are the three heads of directions at the present moment -- they are all alive and kicking. With them I was a senior officer under ZASORIN and looked after three countries. I had SHAPOVALOV as an officer. He is now an intelligence worker here. G: What are these directions called? S: Near East, Middle East and Far East, and each direction has several countries. G: And working groups? S: And working groups.

47. S: There is a safe in which the personal files of the formation -- the files of the agents they are working on -- are kept, along with operational correspondence, the operational code which I gave you, a journal and accounts and a stamp for the documents which we type. We type all documents ourselves. I do a little typing myself. S: We do the typing ourselves and enter the number in a journal. This is seen by a sub-committee twice a month or at least once a month. We receive an enciphered telegram. I make a short entry and take the number. It is already filed. If I have replied I write a short outline of the reply; I write the answer on a red form -- a cipher telegram -- code it with that code, and the head of the direction signs it. He also has a pseudonym -- KAR, [redacted] -- like that, you understand. He signs it. I take it to the Eighth Section on the third floor, where the financial section is. The head of the Financial Section is Colonel TELEGIN and Colonel SHESTOV. Excuse me, TELEGIN is the head of the Financial Directorate. Colonel SHESTOV is the head of the Administrative Directorate. The head of the Medical Section is Colonel MAKEMOV.

48. S: Well, gentlemen, -- our task -- and this is what we work for -- clearly all our efforts are directed to the localization of Soviet intelligence connected with recruitment and agent work. We are not successful everywhere because they work skillfully to deceive counterintelligence. This is a science in itself. In America, in order to carry out a meeting, sometimes an operational worker will spend the night at his desk on a divan in his office in order to go out early when the militia is not there -- when the counterintelligence agent has gone to sleep because he is worn out or the policeman is drowsing. He spends the night in his office in order to go out early and to make his contact.

49. S: I ask you to pay particular attention to radio intelligence. This is a very vulnerable spot which they attack with great success. May I go on with my paper? G: Yes.

50. S: Well then, on the subject of operational intelligence work, SHERSTNEV's Directorate, I have heard, and I will check up on it, that now there is no directorate and I don't think the head of SHERSTNEV. We must look into this. G: SHERSTNEV retired in 1958. Nikolay Vasilyevich. S: Yes, I remember. Operational intelligence is in the hands of SEROV -- in the hands of Strategic Intelligence. G: The head now is KOCHETKOV. S: Quite right, but it is not a directorate. I'll check it. It is also not a section. It is a group which deals with operational intelligence, but it's not important what number it has. I shall find out.

51. S: The principle is this and this is very important. In each military district which borders on a capitalist state there are RP in which there are officers of our Strategic Intelligence. They run and dispatch agents but they have little depth of intelligence, penetration (geographically). These RP's are also engaged in radio intelligence. They listen in on the channels. They collect data on one question or another. So, let us suppose I send material from Ankara which I got from radio intelligence and they also pick it up in Tbilisi and in the Trans-Caucasian Military District RP at Leninakan.

(Razved punkt)

[redacted]

61. S: Incidentally, an interesting detail about Turkey -- it is interesting how little they value a man with us -- even a general. Major General KAZAKEVICH, the military attache in Turkey was chosen to be Secretary of the Party Committee in the Embassy at Ankara. There it is not called the Party Committee; for camouflage purposes they call it the Trade Union. These Party Secretaries are called back by the Central Committee once a year for "refresher courses".

62. S: He went back and said -- SUSLOV was in the chair -- "I want to express the opinion of Ambassador RZHEV -- that was our Ambassador in Ankara -- and of myself as Secretary of our Party Committee. We consider that the Soviet government is pursuing the wrong policy towards the Turkish Government and the Turkish people. The Turkish people are in a state of poverty. The lira has fallen, there is little wheat, everything is expensive etc.. The Americans are not giving as much as Turkey needs. We should make a large loan -- some tens of millions of rubles to the Turkish Government so that it moves away from the Americans". But SUSLOV

[redacted]

said, "What sort of experiments are these with millions of rubles? What assurance have you that we can give this loan and that the Turkish Government and people will turn away from America and come over to us!" He looked a complete fool -- "what assurance?" SUSLOV is a clever man, a clever politician. He abused him saying, "You want to make such a huge loan to Turkey at the expense of the people but what guarantee have you? They take the loan, they eat it, and how do we get them away from the Americans -- from their embrace?" as SUSLOV put it. Well, they told him that he politically shortsighted, illiterate. They removed him and proposed to replace him with ZASORIN, Konstantin Alekseyevich. But Colonel MAKHNOV -- I mentioned him not long ago -- examined him. He had pains in his liver and pains in his heart and he was rejected on health grounds. He's not going abroad now. He will work in the APPARAT -- perhaps for two years. Now they are looking for an attache to gothere. But SUDIN is preparing to go as a counsellor. Well, that was a digression. One thought leads to another.

63. S: Now about agents who are known to me -- I'll give you their full surnames, names, patronymics, even the years in which they were recruited. I have already talked about this a lot. You should consider how to locate them, but because I ran them, I am certain to be called up for questioning. Well, I asked you about this. I have told you about RESKIN. I have told you about YERZIN. Think about how to handle him. He is the prorector.

64. S: Now about agent work, and methods of work in the US and in England -- I'll tell you about America. What SERGEY told me -- he used to be counsellor, excuse me, First Secretary in our Embassy in America. Now he is a counsellor in India. They call him Sergey. I have forgotten his surname for the moment; I'll tell you. He was in America a long time and he knows English quite well. Sergey SERGEYEVICH. G: VURUKHIN? S: No. Well, I'll remember. He babbled away. We have people like that, too, who chatter to one another. How difficult it was for me to work while he yapped about how he spent the night on the divan in his office waiting for the dawn. In Washington the REZIDENTURA is under cover. The agents are old, they were recruited long ago, and they have little value.

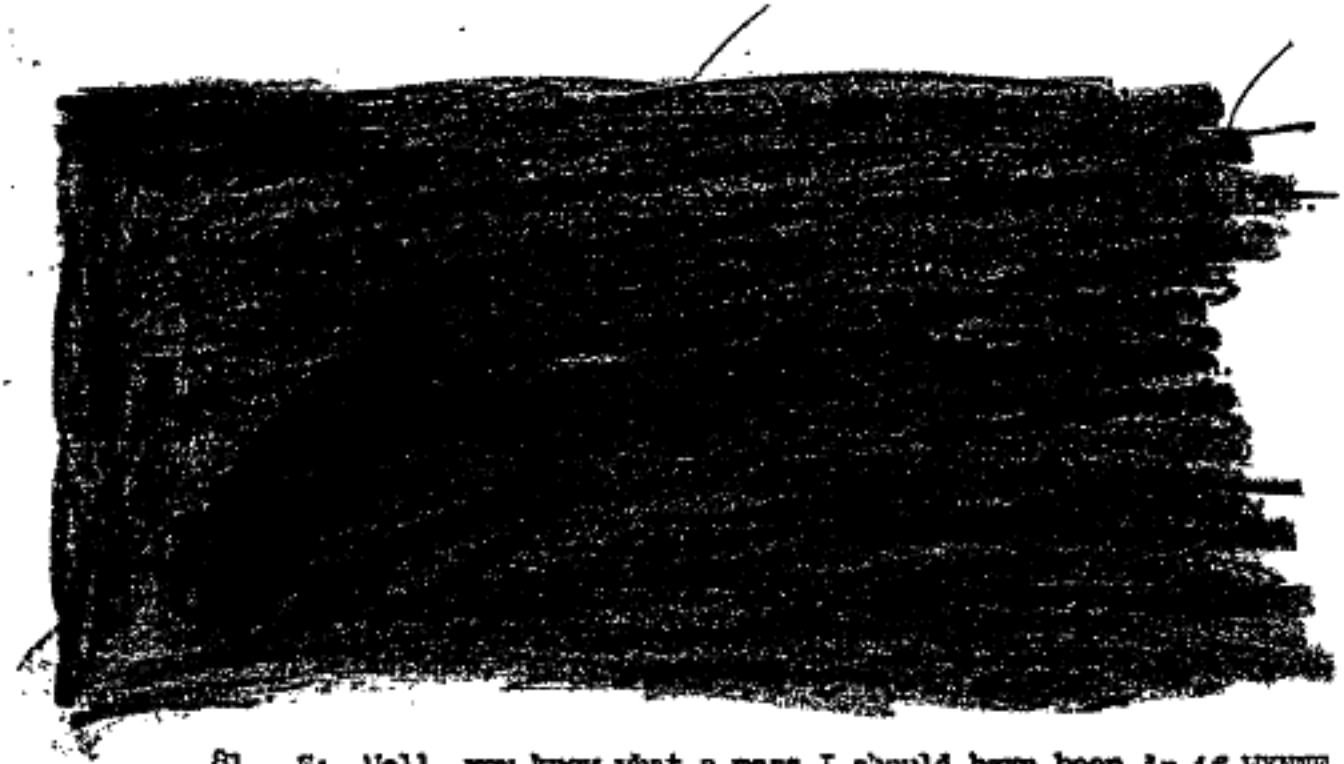
65. S: In New York, there are two REZIDENTURAS, basically under UN cover. That was where the man (MELEKH) was whom you threw out. You should have shot him; you had so much proof. Incidentally, the American Counterintelligence knew he was a SVOLOCH -- MELEKH -- they had evidence. Then they wrote it all out, expelled him and resettled him. How can that be? I remember I said to [redacted] and [redacted] that in this material there are certain facts about MELEKH which may give a clue. I do not know what MELEKH said in court about where he was between 1950 and 1952. If he pretended that he was not working in the Military Diplomatic Academy as a

teacher, it would have been possible to show him my two pages and to say, "You are the author of a book on the English language and here is a no. 75033, the number of the Academy VCh, used in correspondence.

66. S: Just prior to my departure I saw MELEKH walking through the GRU corridors. I read that KENNEDY's brother who deals with legal matters ordered the case against MELEKH dismissed. When I approached [redacted] and [redacted] (if they had accepted my material) this data about MELEKH would have been known. You would have known that he is an intelligence man. (Note: Subject again repeats how he appealed to [redacted] and [redacted] to accept his material and how they feared it was a provocation.) Thus you probably did not believe me for eight months. If only you had let me know in two words. This hurt me a great deal. J: It's much more difficult to work in the Soviet Union than it is out here. S: Of course, you are right.

67. S: I recently listened to a lecture by a general of the KGB on the operations of American and British intelligence personnel in Moscow. He mentioned that American intelligence operations were observed to be concentrated in the Krasno-Presnenskiy Rayon of Moscow. Evidently the area was found to be suitable for conducting meetings there.

68. G: Was anything mentioned about an American attache who was PNG'd? S: Yes, I remember he spoke of a meeting in a bus where money was passed, a considerable sum, but I don't remember the details at all. I didn't pay close attention to it. G: Was the identity of the Soviet agent mentioned? S: No, nothing was said about that. You see, in a case like that the KGB immediately takes control. Maybe our GRU chiefs know about it, but the rest of us were not informed.



69. S: Let me ask this question. Why couldn't two words have been posted, stating, for example, that I should wait for eight months? G: That could have been done, but we deliberately refrained until we could give you instructions for a secure way of passing the material you told us you had. This was to provide maximum security for yourself as well as for our man. S: Did you not receive my first letter through those two Russian (language) instructors? G: Yes, we did as I already told you. We have it here. But we received it after a considerable delay. S: I made a mistake, as I told you before. I wanted to say farewell to them properly at the Naberezhnaya, but I went to the Pereulok and ran into the two militiamen. They saw that I was apprehensive when I saw the militiamen, which was a mistake on my part. When I told them in Russian to follow me into an entryway to finish our conversation, they became afraid and went on. They went along Osipenko Street toward the Baltchuk (Hotel) and I surveilled for a distance since I was afraid that they might throw away the material. Later, after there was such a long interval of silence, I began to think that although they did not throw away the material, they may have disposed of it later in the toilet of the hotel or something like that. Later I checked

(and learned) that they left on the 15th as I told you before. I used this Armenian friend of mine as my cover for asking about them.

70. S: Of course there may be questions here which are not any of my business, so you can simply tell me,("Subject's true name), this is none of your business." G: By the time the material reached us in Washington, some time went by. S: I asked them to deliver it to your Embassy that same evening. Did they do this? G: Yes, they did. They delivered it as you requested. S: Then they were fine lads. I wish them good health. Tell me this, did you understand at once what the subject matter was about and that I was (Subject's true name)? G: Of course we did, immediately. S: That's fine.

71. S: Now let me mention this, in the future if a telephone call is to be made to me, do not speak in English. This, of course, is in case our other means for communication are interrupted and you do know my telephone. By the way, what was the substance of what this man who called me at 1100 hours on a Sunday tried to tell me? All I could get was one word - "March". G: "March", of course is the month. He tried to say that during the month of March or April there would be a signal for you. Furthermore, he said that you should wait for this patiently and should not contact anyone until you see the signal. A signal will be placed and you will be called again. S: This all could have been said in two words.

72. S: Why couldn't you have placed this information behind the radiator? G: Because such a signal would say only one thing -- keep waiting. Then to go back again to the same dead drop with a complete set of instructions would create an additional risk of compromise. S: People go there all the time. G: Why should the dead drop be used for this purpose twice when one time would serve more securely? S: All that needed to have been done was for a signal to be placed and a note placed telling me to wait and that the material got into the right hands. I am sure that there is no surveillance on me at all at this time. G: Most probably not, but there is certainly surveillance on our man whom we planned for you to contact. Consequently this surveillance is also a source of danger to you. S: But you did believe me, that I had this other material that I wanted to pass. G: Of course we believed you because the material that you first sent made it very clear what the situation was. S: You checked all that? G: Of course we did. S: Another thing which confused me was how to convince [redacted] and [redacted] to accept my material directly. However, I won't talk about that anymore.

61. S: Well, you know what a mess I should have been in if WYNNE had not taken the material. I keep the material at home where my agentsa are. The material consists of typed sheets which are wrapped with insulation tape. G: So you keep it at home. S: No, in a hiding place on my uncle's MCHA. The position was ticklish. They might take me out of the committee for training to work under cover in the capitalist states of England or Canada, even the United States. May God grant that this happens because then I could play an important role. Everything would be in my hands, everything - ciphers, radio intelligence, people. This would be important to us. There is one agent -- I don't know whether he is in England or in America, but I'll swear by my life that there are agents.

62. S: Yesterday CHARDYNOV had an agent meeting. He told me about it yesterday. The man is somewhere on the other side of London. I got the impression that he is some kind of a clerk or a press worker as far as I could find out. I couldn't put direct questions to him but he told me enough about it for it to be understandable.

83. S: The question is what will my position be? Suddenly things will get bad for me. Some member of the Central Committee -- you know the sort of SVOLOCH -- will say "Such a man", as myself, "cannot be tolerated in the GRU. Let's finish with him." Besides, they know that the deputy of Major General SHOLDKOV -- the lame one I told you about yesterday, Major General SHUMSKIY, -- told me officially "This report has come from the KGB archives saying that Colonel (Subject's name) made a false declaration. When he reported on his father, it did not tally with the actual facts. His father Vladimir Floriyanovich was of noble descent." His father was my grandfather Florian Antonovich.

84. S: I have recently found a distant relative - he commands the Far Eastern Military District -- Colonel General (Subject's name). He is my great uncle but since he knows about our past he does not keep in touch with me. I see him on rare occasions. He has a wife and a son -- he is a fat man -- Valentin Antonovich. He was Chief of Staff to MALINOVSKIY when the latter commanded the Far East Military District and when they made MALINOVSKIY the minister -- this fool -- they will take him away. I wrote all this down. There is no suitable candidate. ZAKHAROV, the Chief of the General Staff, is ill. Incidentally ZAKHAROV was himself head of the Second Intelligence Directorate at one time. I have not seen Valentin Antonovich for a long time. I think he ignores me because of our past, and our noble background. He keeps a flat in Chistyye Prudy in Moscow. We meet occasionally and he says "How are you?" but no more and I do not seek him out either. He is the younger brother of my grandfather. My grandfather was a great jurist, a high-placed official. He had a rich home and everything was elegant.

85. S: They christened me -- I was born in Ordzhonikidze -- in Stavropol and my name is in the church register in Stavropol. They searched out the entry in the archives which were taken away by the Germans when they destroyed the city. They are still studying them. The KGB is studying every name in the archives. That's the way they work. Well, they turned up the fact that my father was a White Army officer, a second lieutenant, that in May 1919 he received the rank of first lieutenant in the White Guards, and that he was killed when his unit was surrounded near Rostov. That's what my mother heard -- you know these rumors -- and what she told me. But he said, "Your mother reported that he died of typhus during an epidemic". My mother did not want to wreck my life. She gave me this cover story and that's what I wrote at the beginning. I suspected

P. Baptized

of course that this was not true. My father was well born. He finished at the Lyceum, he was a mining engineer and then of course he joined the Whites and fought against the Soviet regime in the civil war. Well, I felt this. My mother never told me, the more so since I never saw him and never called him father. I was 4 months old when he last held me in his arms and he never saw me again. That is what my mother told me.

86. S: Well, SHRAYKIY said, "Well, there you are. Write me an explanatory note." I took a small piece of paper and wrote. My wife does not know about this. She loves me and I love her. She has a sister, a brother, and a mother. They are of proletarian descent. Her father was a POLITRABOTNIK. He died in 1952; he had three stars. He was a good man. He swore at Stalin; his family didn't agree with him but he criticized everything. He was a straightforward sort of person. I called my mother to my aunt's house. She (the aunt) lives on the fourth Meshchanskiy street. She is the sister of my mother. I called my mother there and told her what had happened. She said "Oleg, I knew nothing about this". I asked her to write me an explanation. She let me have a letter explaining that in such and such a year she had gotten to know so and so; he said he was an engineer and showed her his papers; they got married, the civil war began; she bore a son shortly after this and her husband disappeared without a trace. This two-page letter is now in SHRAYKIY's safe. Now, when I was filling out the form for the trip here I went to SHRAYKIY and said, "What can I write after what you have told me about my father?" He said, "Write just as you have always written".

87. S: The KGB supplement reporting all this was in the file, with a note on top stating "We trust Colonel (Subject's name)". That saved me from being dismissed from intelligence. They must believe me because they gave me my passport even though it was held up. As you know they gave everyone their passports except me. I got mine at the last moment. The Foreign Travel Commission of the Central Committee examined it at the last moment. SVOYCHII of the KGB sits there. If they hadn't given it to me I would have gone straight to the British or American Embassy and said "To hell with you. Good Bye! "

88. G: This Central Committee, is it a military committee?"
S: The Military Section -- the Moscow administration -- generals and all

P's wife has a brother + sister + Mother

the colonels. G: Did they take your Party card? S: That is for a PC3 but when I came to you I gave my card to the Party committee. I left it there and the Party committee put a stamp on it. G: And they give you another book? S: They give you a small coupon as a receipt. Well, that is my situation.

89. S: What do I want to ask you gentlemen? First we must think about and develop one or two dead drops. This is essential. I need a place where can I put a film -- undeveloped, of course. I repeat I will never develop them since I have no means to do this. G: Remember that the servicing of a dead drop by one of our people who is possibly -- probably -- under heavy surveillance is a constant danger. It can be done like this but nevertheless..For you to fill and clear a dead drop when there is no surveillance is no problem. But although you live in Moscow and although you are #2, I am sure that you can have no idea how heavy the surveillance of all our people in Moscow is. S: I do understand. G: Then double this understanding and you will be closer to the actual facts. This is a great danger. Understand me, we are not worried about our men. What can happen to him as a diplomat? A small scandal and he is thrown out. He will be alive and well but... S: I am gone. G: Thank you, that is right. Secondly, even with an ideal dead drop there is uncertainty if hot material is in it for any length of time.

90. S: Let us work in such a way that the drop is full for only five to ten minutes. G: If you are working with such a short time schedule, personal contact is more reliable. Since at least it would be known that the material got into the right hands. S: The meeting place I gave you by the statue of REPIN -- before the entrance to Lebyadinskiy Street, the Tretyakovskiy Gallery -- is a good place. You can change the times I gave you. I changed the series of dates. G: A signal is no problem. For example, you know the Novo-Arbatskiy Bridge. S: Yes. Foreign cars turn off there. They live on the Kutuzovskiy. I wanted to put a note in one of them (i.e, the cars) which said, "Give this to the American or British Governments". I was ready to do it.

[redacted]

[redacted]

car pick me up along his road of travel? It's dangerous, I suppose. G: They would arrest you and the car. You would be surrounded by 5 cars. S: You know I was looking for a diplomatic car which had stopped outside the restaurant and which had the letter "D" on the back. I know the types of foreign cars. I looked for foreigners too, but they were all tourists. You know how tourists react -- like MOYNIHAN and MCBRIDE.

92. H: I think we've got to get it over to him that whatever is done, not only must he know that this is really going to be removed but that the material must be removed in the shortest possible time. This is the first thing. Now just to continue for a moment --. There are various ways this can be done. We've already mentioned a party at which he would be. He would know that the man who was going to pick up the material was there -- he would put it in place and the man would remove it. That's one method; the other is equally simple. If there isn't a party there are certain public places, restaurants and the like in Moscow where he and the man can be on given days. Even if there is surveillance there, they can still go to or pass through certain parts of the building within a reasonable time of each other. You have that variation as well. So even if he does get removed from his post and doesn't come to meetings on a given day of a given month you can still have the two people who are already known to each other and who recognize each other in the same area. Do you see what I mean? This is again a DLB and not a brush contact, but in fact has the same control as a brush contact. This is an extention of the original idea.

93. (Note: G translated the preceding for Subject.) G: The simplest thing would be if you and someone whom you know were in the same place. The essential principle is that the material is there for as short a time as possible. Other variations of the same theme might be like this -- in various public places it would be quite normal, if you know the time and date to be there, to leave some material in a given place and at a given time so that it could be passed though not by personal contact. Thus, you lose no time and you know that it is in safe hands. This can be arranged to be done in hotels, etc. Of course, the toilet is particularly dangerous -- this is well known. S: Yes, in the GRU we call it SORTIRNAYa TAKTIKA. G: But if there is a telephone booth in the entrance, you can go in an telephone and ...

94. H (In English): Couldn't you do it much more simply than that? Look, you go into a restaurant; our friend is there first of all;

he is sitting at a given table. He knows that he has got to finish his meal punctually at 7 o'clock or whatever time is agreed upon. At 7 o'clock he gets up and moves from the table. Somebody else comes in and sits down at the table. He goes off to pay his bill. The other chap sits at the table, puts his hand under the table and removes the stuff which is stuck underneath. There are all sorts of variations on this. G: If you have made your table bookings. H: Yes, these things can be done in this sort of way. These are just general ideas. (Note: G explains this in Russian to Subject who asks about surveillance.) S: Surveillance is very concentrated against your people in restaurants. H: (in English) The whole point is that you can do it with surveillance there because they can't see it. (Note: This is explained to Subject.)

95. S: I already have some material prepared for you. They are without classification stamps, top secret, and written for service use, not for sale. For instance, there is a new artillery instruction (NASTAVLENIYE) -- very interesting. In the journal VOYENNAYA MYSL on which is written in red "Only for Officers, Admirals, and Generals of the Soviet Army" there is an interesting article on future planning, training, and so on. These are big journals. I also have three small studies (POLOZHENIYA).

96. S: You should pay special attention to the Dzerzhinskiy Academy. I'll tell you more about it. There are 2,500 students studying there and more than 1,000 teachers. This is the blacksmith shop where rocket cadres are forged. The students are accommodated together. There is one set of living quarters on the territory of the academy on the Solyanka and the other is near the British Embassy on the Sofiyskaya Naberezhnaya at No. 36. The reception hall of the Minister of Defense is there and your embassy is three or four houses away. If your man stands on the bridge at eight o'clock in the morning he'll see all the officers going along with briefcases, crossing the bridge to Solyanka. Hundreds of them live there in a huge four-story building. Both bachelors and married officers live there -- they have small separate rooms -- "It is something terrible" (in English).

97. S: I have a very interesting description of the Academy; the principles of planning the duties of the departments (KAFEDRA) signed by a colonel general, the head of the Academy -- ODINTSOV. His initials are "G.F." but I don't want to give you his full name just now. This is what I have ready for you. A large hiding place is necessary for all this. But this is interesting. You will detect the principles on which the instruction process is planned. There is no mention of the word rocket,

KAFed

but you will know. Then there are diagrams giving the division of the various special classes -- which floor they are on -- departments with actual models. All the rockets are broken down in diagrams. That is the material that I have. And then I might be able to take from the secret library (GRU) any of our documents (USTAVY) on theoretical perspectives, in which wars are planned and concrete orders beginning with the ..lowest echelons.

98. G: Do you have classes once a week, or once a month? S: We have Commanders' training every Thursday. They give us lectures. And then one can work in the top secret library. One writes his requirements on a piece of paper, gives class and room number and are locked in and can study what one likes. I haven't done this yet myself because I thought ... G: This is of the greatest importance. S: Just listen. I will give you material... G: (to H in English) You know what this is? Every week since they are military and high ranking they must keep up with their military studies. They have commander days on which they are given the afternoon off -- they have lectures. But then they are going to be given examinations and they have practical, as he says, map studies. But in addition to this, because of the quizzes coming up which are registered on their efficiency reports for examinations they must have very highly classified reference material which is locked up in the secret room, which they, under receipt, are issued, not to take out but to sit down in a little study room and study for two or three hours on Thursday afternoons. He can copy from this, put the material there, return the books, and the receipt is okay, because he has studied and is authorized to do this.

99. S: Selected copies of all the lectures of the VPA which are kept in the academy safe at Sokol are brought to the general staff of our directorate so that our intelligence officers should read them and know what goes on. Whenever I like, I can take out a lecture on intelligence (SPETSPODGOTOVKA) -- on theory -- we in strategic intelligence consider this a science. G: (to H in English) Intelligence texts. S: And I could photograph all this -- they are all typed and bound. G: Can you take them away? S: Not out of the building. G: Is there enough light for photography? S: Well -- at the windows with a Minox -- the negatives might be weak -- you would have to strengthen them and develop them. The quality might not be very high, but I could not copy them out.

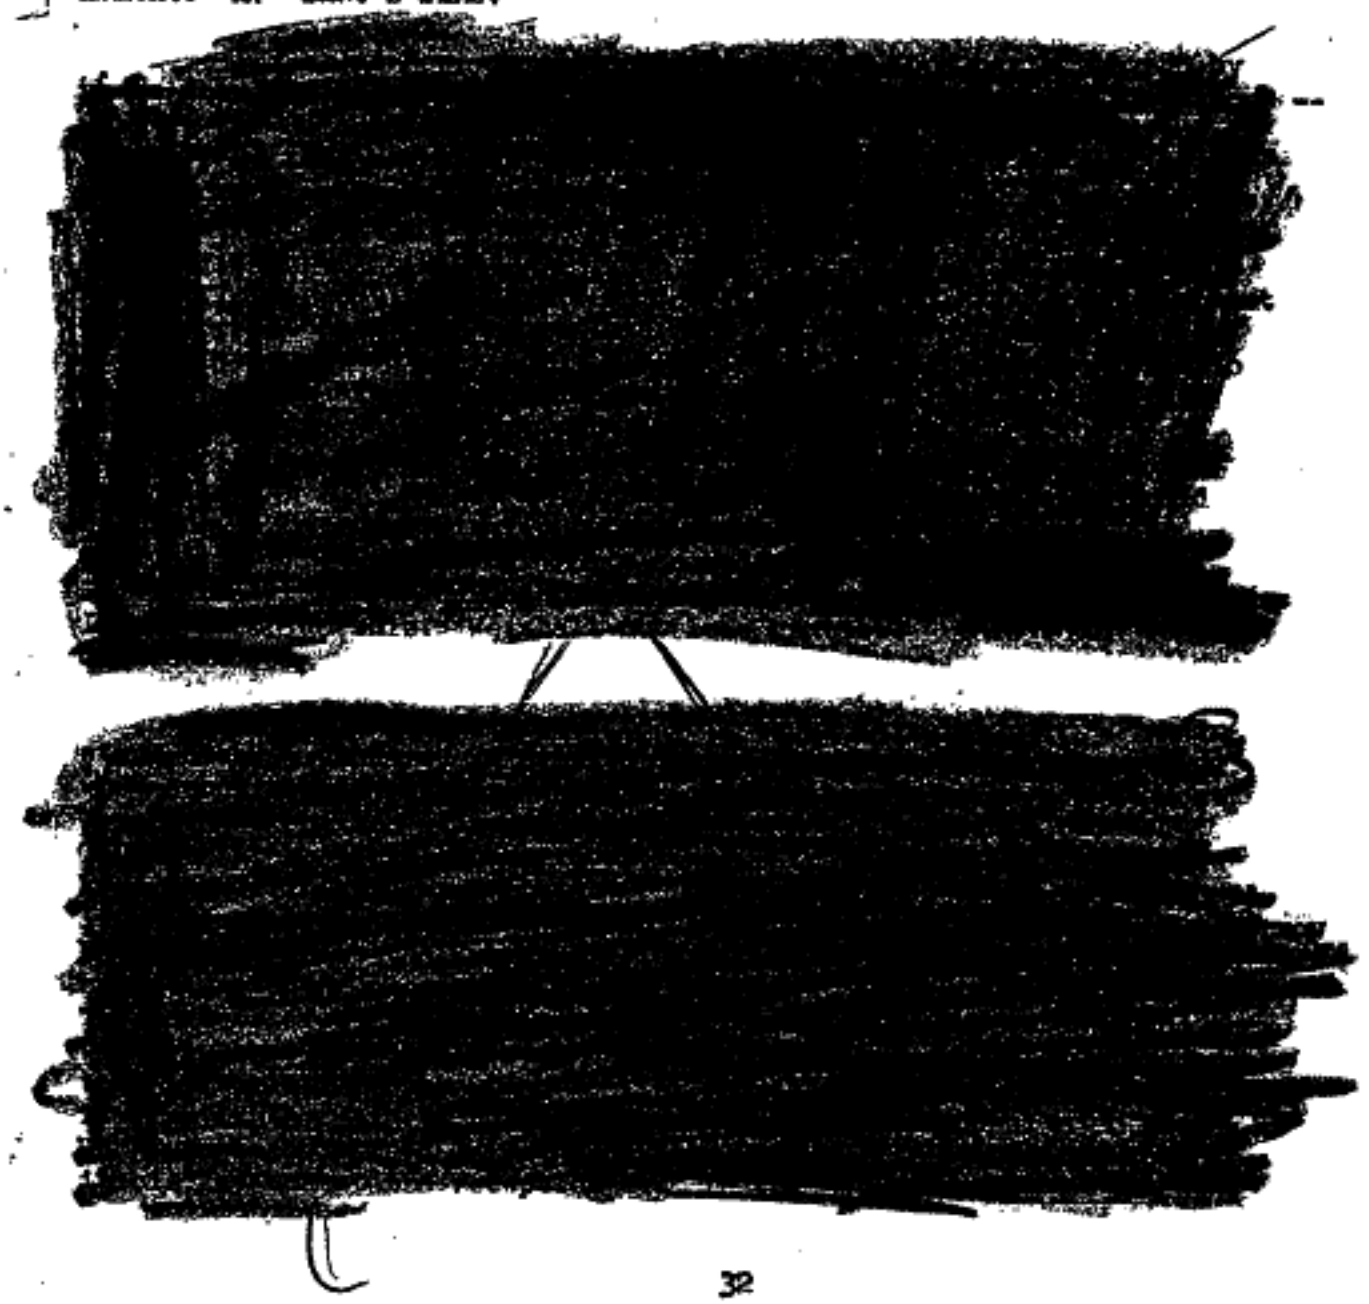
G: Returning to communications; - I have a suggestion. Football matches -- you go to a football match at the Lenin or Dinemo Stadium -- Hungary or someone else is playing. Our man buys a ticket...During the intermission at the half whole crowds go to the buffets for a glass of beer or what not. To break away from surveillance in this crowd is simple - and you meet our man at a very crowded buffet and brush-pass materials back and forth in relative safety --. S: This can be easily done.

100. J (In English):...Carry one of these (a briefcase) and drop part of it. S: Do you know why this is a bad idea? Because in the crowd there are many thieves. You put down your bag and they would steal it. J (In English) I wonder if as a basis we would get some idea of his movements -- of his normal movements -- where he lives, where he works, where he goes every day (explain to Subject). S: I live on this island GORKOGO NABEREZHNAYA NAKSIMA 36, Flat 59. The entry is from the courtyard, 3rd floor - 3rd entrance -- if there were no surveillance I could have you all as guests in my home for tea. There is a lift. The attendant is an old woman. J (ask him how high the building is) S: The building is new. It was built in 1944. It is a grey building with a balcony at the top. Nine stories -- a large building. And that is where all the big people live. In this alley is the headquarters of the Moscow military district. G: There? Also on the island.

imp

101. The headquarters is on Osipenko Street and Maxim Gorkiy Street. J: How many families are on the same floor? S: Four, each has its own flat, two of the flats have 2 room and two have 3 -- I have two rooms -- a good large flat, 45 square meters. Before I lived on Mayakovskiy Square. Not directly on the square -- you know the military political academy on Bol'shaya Sadovaya at No. 2. I lived at No. 6. There we had a common flat of 2 rooms. That was during the war. Well now, how do I go to work; -- along Ulitsa Osipenko to the bridge and across Red Square. J: This is on a daily basis - every morning? S: When the weather is good I go on foot. When it rains, I go either by cab or on a bus -- no. 6 bus along the Gorkiy embankment. G: Does it go over the bridge? S: It goes along Osipenko Street to the Balchug and past the British Embassy to Kamennyy Most, across the bridge to the Voyentorg and Kalinin Street. G: By the Kremlin? S: Yes. From there it goes to the Arbat and then along Vorovskiy Street where your embassy is, across Vosstaniya Street to Krasnaya Presnya to the Archangelsk cemetery and along Khorosheyskoye Shosse.

imp



102. J: And where do you get off? G: On the Arbat? S: No, no, I work in two places. In the morning I must go to sign in at 11 Gorkiy Street beside the telegraph office and from there I go by Bryusovskiy Perenlok where the church is, behind the committee, to the Chaykovskiy Memorial. The conservatory on Gertsen Street. There I go left along the lane to the Voyentorg and from there straight to Frunze Street, where the General Staff is. I do to Entrance No. 5, which, as you go straight from Frunze Street, is on Gritsevets Street. Entrance 3 is on Gogolevskiy Boulevard where the pistol range is. The people who use entrance 5 from Frunze Street are the Minister and his Deputy -- as a rule though the minister goes through the gates from Gritsevets Street in his car -- a Cheyka. G: And then there is a square where they play volleyball. S: Quite right (in English), when you were in Moscow. J: Can you identify the block, according to this map, that he lives on. S: Excuse me, gentlemen, will it be difficult for me to get into America House. G: Do you need to go in -- by the side of it, yes, but not into it. S: Why should I go by the side of it? Just to throw something over?

103. G: Yes. That's just a variation, but excuse me, between which streets do you live? S: I live on and my windows look on to Gorkiy Embankment on the bridge. We have a yard with a thoroughfare which takes me from Gorki Embankment to Osipenko Street. I turn to the right immediately onto Osipenko Street -- the tram stop is there. [Discussion of exact location of house on map.] S: This is Usinskiy Bridge. There is the Dzerzhinskiy Academy. Here is the Kitayskiy Pereulok and here is the Solyenka. The academy takes up the whole block; there are many buildings there. In the first unit sits VARENTSOV and the staff of his ground rocket forces and the other buildings are for training, even storage, etc.

104. G: But which bridge are you nearest to? S: To this one, - about 200 meters, and to this is about a kilometer. Opposite my flat is a stop used in the Summer by the River Boat System. When I was at the academy, I used to get off at this stop by the bridge and come along past the mooring here. G: From the other side? S: Yes. I've lived in this flat for 15 years, since 1945 -- everyone knows me. Right behind by home is the garage of the Moscow Military District - an Avtobaza -- a large garage for all the command cars...the exit is onto Osipenko Street.

[redacted]

watch us. KGB people always go to the receptions. If your man intends to go to them it will be necessary to go to the bedroom, to the toilet or to the kitchen where the wine is - close the door and to choose the moment. H: That's fine.

[redacted]

The exact coordinates -- X and Y are not known -- of course this is difficult and will not be learned. This is why Khrushchev and his General Staff have set a goal -- to comb through huge areas with atomic and hydrogen weapons -- understand? To create a rain of missiles -- this is Khrushchev's own expression, and was told to me by Varentsov; I believe Varentsov as I believe Churayev -- who said that Cyrus Eaton has offered his services. Such dangerous people we are dealing with; -- how this is done is your business -- as far as my own safety is concerned --, as far as I am concerned, I have aggressive and iron will power and am just a cog -- especially now, in fulfilling new assignments.

114. S: It seems to me that (in spite of the tremendous tasks which are being done by the American leaders and the British and American military commands--) the evaluations are wrong -- too much giving in and compliance, and indifference. For instance -- whatever amount of dollars and pounds you expect to allot in your planning -- you must triple this amount in order to be really strong. Then, when you hear by your "grapevines" that Khrushchev is ready -- that he has many missiles (and I also will hear things through some of my channels--either in my present line of work or through other channels with which I have indirect contact--) then the first blow must be struck- a knock-out blow-and then we will be in a winning position. As I have said before, in regard to your thinking about the targets -- which we discussed -- you must be as sure as that 2X2= 4, that such targets don't exist.

115. S: If Hitler would have done this, he would have won the war. After all -- what did Hitler do? He wasted millions of tons of metal -- but did not destroy completely even one Headquarters. This I know exactly -- I read it in the reports of the General Staff, and heard it in lectures given us on military strategy. The Chief of the General Staff and his depty -- MALANDIN - a General of the Army - (4 Star) - the Deputy Chief of the General Staff -- I heard his top secret lecture about 2 years after the end of the war -- in 1947 -- . He had a lecture about Hitler -- not one of the Military District Headquarters which provided the front with the batallions, regiments, brigades, and divisions -- was destroyed by him. All the millions of people in the Moscow Military District from Kalinin to Kaluga were trained -- and all the time the Moscow District General Staff was located on Osipenko ulitsa and the Moscow Defense Zone was intact. If Hitler could have blown up

all this by commando groups -- if he would have done away with the core that does all the planning, that has the experience, the know-how, then the Soviet Government and military leadership would have been powerless.

116. S: That is why I insist that you consider these targets-- such as the General Staff -- the GAU, PVO, the CC/CPSU, where all the Ovolochi who rule everything are presiding -- all the inspectors who have the privileges of a Secretary of an OBKOM -- they have a salary, cars for their own use, and an allowance. I am not mentioning the bases and ammo dumps which are under ground, but the military districts -- there are 20 of them -- no -- 19 now -- in a few months I shall be able to report to you that there are even one or two less -- they are being consolidated --. It would be desirable to destroy the Headquarters. It would be good strategy to get rid of the experienced commands because they are the heart of the Army.

117. S: When this H-hour takes place -- then you need 2 minutes. Everything must be in readiness, by way of mines equivalent to one or two kilo-tons -- they can be put into a little suitcase (this is just my own idea) -- a little satchel, and left next to a house -- not inside-- you don't even have to go inside -- there are guards all around and you need a pass to get inside -- and if you don't have one you might get killed -- but put the things all around the building -- right next to the guards -- with a clock mechanism -- and let the whole establishment go up in smoke. Then, when the leaders, the framework of the working body--the framework of the general staff and the central directorates, which are the brains of each type of troops -- tanks, artillery, aviation, antiaircraft -- when these are all destroyed, then let's see them pick themselves up and recover quickly...Then they will have to use some old, sclerotic poets, not fit for military duty -- who will not be able to do anything. When you destroy all the operational documents -- not from the air -- not by rockets -- you know how many errors can be made by missiles and aircraft -- pray God the accurate missiles will be on your side -- now mine.

118. S: It is so easy to make a mistake with a missile -- a simple error in calculation -- a mischeck on one of the control mechanisms - and a mistake is made. Even while the rocket is being

wheeled to the launching pad, and after it is on the pad, checks are mandatory. One time Varentsov brought all the Artillery Generals together -- commanders of artillery divisions and Artillery in Districts and Groups of Forces and he made them measure and check all the control mechanisms with the help of special instruments, panels, voltmeters, so that they would be familiar with the work of their subordinates -- how many hours are spent on a technical check, so that when they give an order to make a check, they would know what they were asking. So he made the Generals climb up and down the ladders and find this out. He made them do this for several months. It was a good idea, this -- he was a very experienced man.

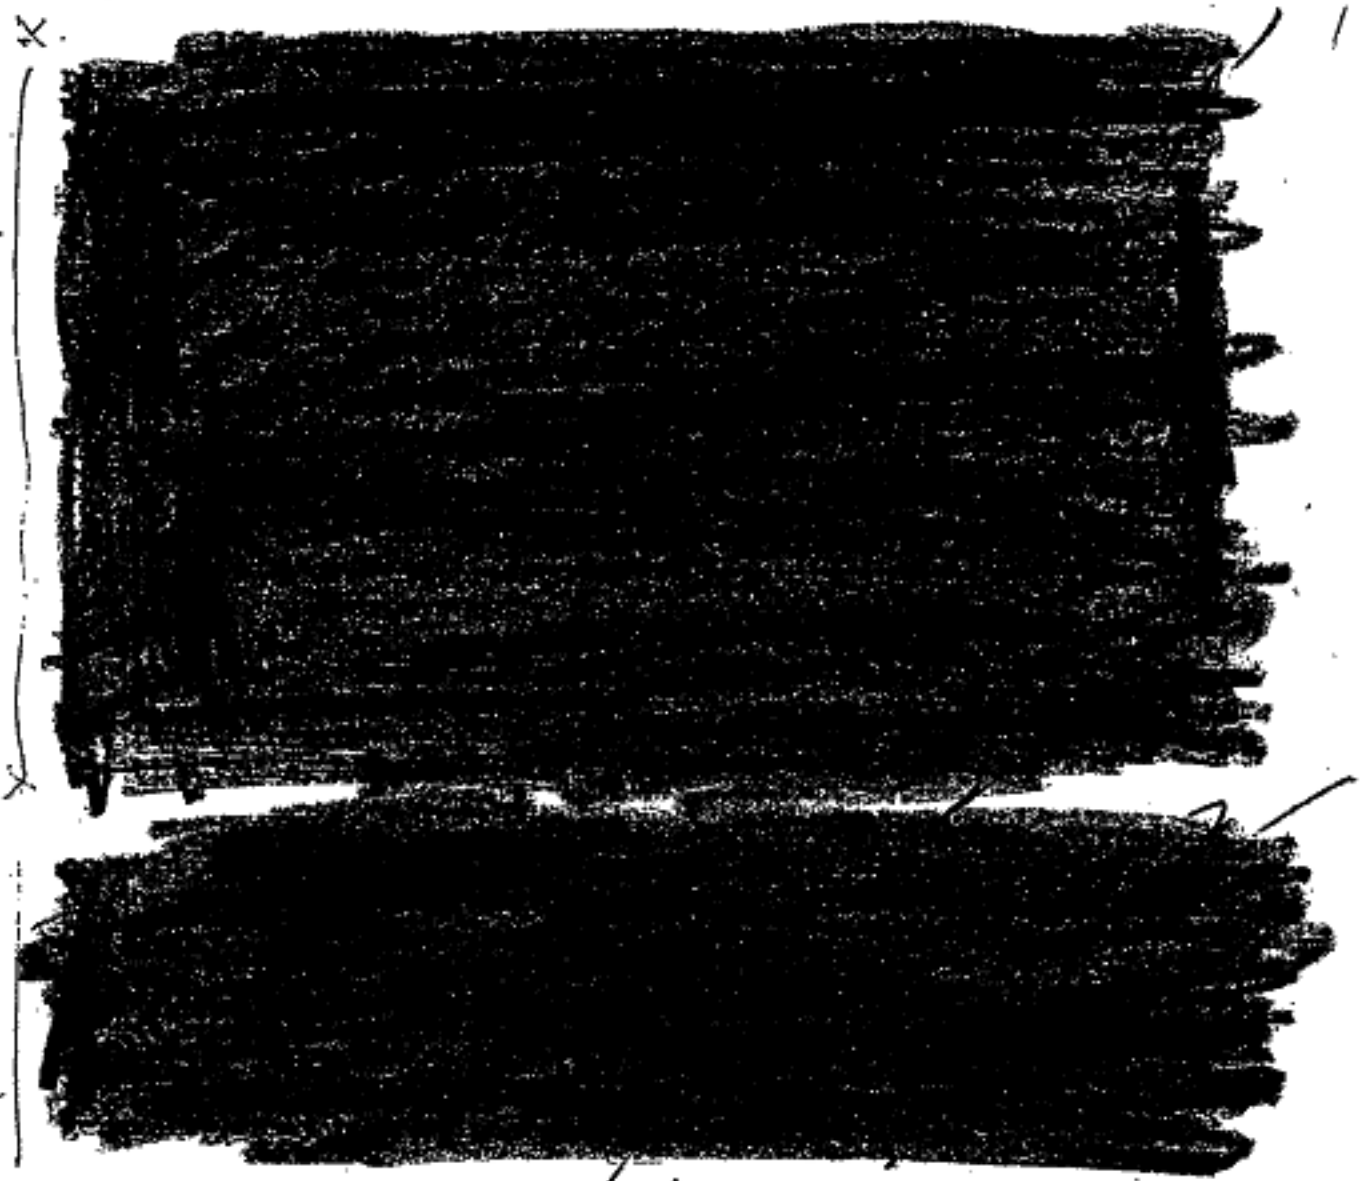
119. S: Now, what else, I keep harping on being an officer of the General Staff but now in your service; I know a good deal about it -- I studied a good deal about it, as I told you before. I would like to have someone report my idea -- the idea of a soldier in your service -- but that of an experienced soldier. This idea is, first: that we must penetrate to the command echelons so completely that we will be able to liquidate everything at once. Point number 2 is to cut all this discord and differences of opinion, and third to divert more money toward military preparedness, so that the level of our readiness is higher than that of the probable enemy. I know that in some aspects your "missile business" is going very well. We know that it's better than ours in many respects from information we got from our agents. We know it's better than we are doing in the Soviet Army. But, we also know that you are not entirely ready. We know that all the guidance assemblies are not perfected and that your scientists are still working out problems. God willing, I hope that my so-called "copied labours" will help your scientists, who, in the space of the next few months must study all this, assimilate it -- see how the problems are resolved; perhaps the information may not be all there (in detail) after all, it is condensed -- these were courses, not the Academy. I did not study 5 years as one does at the Dzerzhinskiy Academy -- but the push in the right direction is all there for the specialist who will study this.

120. S: Talk things over, you are responsible people. We are resolving serious government problems, from my vantage point, with my capabilities, much of what I have to offer is not complete, that is,

complete in the sense of being conclusive, but the basic information, which I have gleaned from my General Staff and from the people with whom I have contact, I entrust into your hands so that it can be fully exploited. Not only by you, but so that it will reach the very top level people in order that they may examine and evaluate the entire matter and come to a practical conclusion, otherwise its possible to lose all. All the gold, all the treasures, diamonds, everything of material value, all the plush economic abundance which your people really possess. After all, one can tell your people live well, just look at the way they dress. They may not eat caviar, but they have bread and vegetables and not just for today - but for tomorrow as well -- don't laugh -- I just use this as an example..

121. S: The government must become so thoroughly aware of the seriousness of the situation, and must, in this one respect take an example from Khrushchev and the Communist Party -- their ability to centralize and to extinguish contradictions. Look at the divergence of opinion which arose between USSR and China. They extinguished that. There are great differences, even discord, theoretical and even political, but I don't want to go into that now. But they know how to centralize so well. Things are not going so well with Albania. At the meeting of the Communist Parties, Hoxha took such a stand that Comrade Dolores Ibarruri said "Such a revisionist is second only to Tito". This was the comment made by Comrade Ibarruri. There was an interesting conversation between Khrushchev and the representative of the Chinese Communist Party, the deputy to MAO Tse-Tung there. You know this leader. He, as are all the Chinese, is defending Stalin and berates Khrushchev, and says that by his unwise, loud, public, world-wide disclosure and denigration of the personality cult, he has undermined the authority not only of Stalin but of the entire Communist Party. Stalin was the symbol of the Party and of the people, even of the people of other countries. Khrushchev became quite agitated and said "Take your Stalin out of here, together with his box". In other words - "Take Stalin's body". And you know, there was a time when they wanted to put Stalin into the ground, there was such a time.

122. S: I repeat, we must be able to resolve any major differences of opinion, we must come to an agreement, and this we must learn from our enemy. He knows how to do this -- the Central Committee,



the Presidium, Khrushchev himself. He is not so smart, but he is energetic and resourceful. He was the Minister of Agriculture for three days when he called in all the secretaries of the Obkoms whom he had appointed as secretaries of Obkoms -- they are all members of the Presidium -- (he had been appointed Minister of Agriculture by Malenkov, Molotov and Kaganovich only three days before) and through the apparat of the Central Committee of the Communist Party, he was able to gather together, by plane, all the secretaries of the Obkoms to old Red Square, thus he had a quorum -- a majority of people who were candidates or members of the CC -- and they supported Khrushchev because he was the one who appointed them as Secretaries of Obkoms. The reason I bring this up now -- if he could not have called them all in on a moment's notice, then he would have remained among the ministers. Perhaps Molotov or someone else would have been seated, what would have happened later, I don't know.

123. S: There are many differences of opinion between the Satellites and the USSR, but Khrushchev knows how to localize these things and put them aside. Take a look - rocket weapons are delivered to all the peoples' democracies, without the (atomic) warhead, without the head, with the exception of the DDR -- the DDR already has this -- you know this. There are two brigades there and two dumps of atomic warheads (Soviet Army, not in the hands of the DDR). The Eastern sector there welcomes Soviet power the way I would welcome a well-aimed blow. Well, he knows how to handle such things. What is happening right now -- many specialists, such as engineers, have been sent to these countries. You know, you have your own channels, you watch such moves. There are all kinds of things going on -- construction of launching platforms, building up cadres.

124. S: Here is an interesting detail: recently, when Khrushchev was calling together all the leaders of the Warsaw Pact -- political chiefs -- all were chiefs of general staffs, and all defense ministers were there, and we have a great exercise (CPX) at the General Staff for about two weeks. All the ministers of defense and chiefs of staffs of the peoples' democracies were operating in maneuvers with ours. Offensive operations on maps against the foe, openly naming the targets which were open to attack from the air by the British, Americans, French and West Germans. The games were on a Headquarters level and

[redacted]

lasted 2 weeks. The political leaders returned to Warsaw Pact meetings after about 2 days, but the military leaders all stayed behind. The games went on for 2 weeks. These were full scale maneuvers, centralized. Now war preparations are going on full scale - there are many disagreements -- much money demanded and squeezed out.

40

[redacted]

[redacted]

127. G: The Second Directorate is ours. Then there is the large Organization - Mobilisation Directorate -- ORG-MOB. G: What number has it? S: You know, it has a number. It used to be the 4th Directorate, but now they are changing the structure, since the arrival of Zakharov. I will give you specifics later and an organizational chart. There is a Directorate -- called the 7th which is for Chemical and Bacteriological Warfare. Here you have the most important generals, specialists, and important chemists and bacteriologists. They have their own bases, in Siberia and other places. By the way, it is very important to bomb the Ural district - you must make a literal rain there. In order to knock out the brain, the all-powerful brain. The Urals are the forge -- the smithy. All the heavy industries are there, and factories are being built underground. I don't know exactly what kombinaty.

128. G: Is the radiological -- under the Chemical Directorate? S: Yes, it is under it, yes. G: I see, so it is like ours - CB. S: That's right -- absolutely right. Now then, there is the Code Directorate in the General Staff. We have (in GRU) the 8th Section-- but here it is a Directorate. The 7th is the CBR, then the 10th Directorate is the one which works with the Countries of the Peoples' Democracies. It controls the army there with a bureau of instructors - the weapons, brings their people here for instruction -- this is the 10th Directorate. G: This is in the General Staff? S: Yes -- in the General Staff. That is the structure of the General Staff.

129. G: Don't you (GRU) also have a Directorate for the countries of the Peoples Democracies. S: No we don't. We coordinate everything that has to do with countries of Peoples Democracies with the Tenth Directorate of the General Staff. We do not conduct intelligence operations against the countries of Peoples Democracies. G: How about the advisors? S: We have advisors who are intelligence

[redacted]

officers of GRU who study the intelligence of the countries of the Peoples' Democracies and they are sent as advisors to the Tenth Directorate of the General Staff. They send the officers off from there and they control them and coordinate their efforts. We teach the intelligence people of the Countries of Peoples' Democracies thru our advisors.

130. G: I have another small question, before I forget to ask you, with respect to the missiles. The Russian language has a curse in printing since the letter "Z" and the number 3 are the same on a typewriter. Which designation belongs to the rocket you've described. The "Z" could stand for Zenitnaya. S: No. It is a three, and it couldn't be Zenitnaya since the rocketa are surface-to-surface. Let me explain: The 3R is a rocket designation and the second number such as 3U1, 3U2, etc., are developments of the rocket; that is, rockets with modifications. G: Why does it begin with 3R? S: That is because the adopted model was the third series and the additional numbers are modifications thereof. Furthermore, everything in the series beginning with 8 means that it belongs to rocket artillery. It is like a code designation and all auxiliary equipment if it has any designation at all will always begin with 8. G: How about the designation "P"? S: That is merely a designation for a launching installation (Puskovaya Ustanovka) for free rockets. They launch at an angle.

131. G: How about the SP-5? S: That is a rocket which was a special improvement of the submarine rocket P-5, which can be launched from a submarine or a surface vessel, and the SP-5 has been adopted for use by the ground forces. Frolkovenko, who was formerly my chief of staff, and who is now studying at the Military Political Academy and who was a senior lecturer at the Artillery Academy, told me about this, and they are now studying it. G: What does the A designation "P" mean here? S: That means submarine (Podvodnaya) and they added the letter "S" when this was adopted for the Ground Forces. I wrote all this up.

132. J: Does he know how many atomic submarines they now have? G: (Translates) S: We were told "up to ten". They did not say exactly ten, but I believe they were misleading us. G: How is that-are there less? S: I believe that there are more, maybe as many as twenty. G: Exactly when was this you heard it the last time? S: This was at the time I was

taking the courses over a year ago (Subject's courses ran from 1 September 1958 to 1 May 1959.) This construction is being pushed. Khrushchev has ordered a number of old naval vessels to be scrapped. However, much attention was always paid to submarines and these were never touched. They are not building any aircraft carriers; they are too expensive. This all began when Kuznetsov was removed. He is now completely retired. At that time he protested about the lack of vessels in the Soviet Navy but Khrushchev, supported by the General Staff, decided to reduce even the very small Soviet Navy. However, submarines are being constructed. What other questions do you have.

133. G: What do you mean by the term "Kren"? Is it a deviation from the course? S: Yes, it is a deviation from a set course. This takes place after the various stabilizers and rudders have brought the missile to a position of zero deviation and after the missile then completes its active period of flight and continues on toward the target, "Kren" is the amount of deviation, or turning, of the missile necessary to strike the target. G: In other words, "kren" must be established. S: Yes. It is a calculated deviation, and if it is not correct, the rocket will not hit the target. You see what I had planned was for WYMIN to have picked up all the material and have your experts analyze it prior to my arrival here. G: Do you feel competent to answer questions on this? S: Yes, I can, and even if something is not clear to me I can check it our later. However, I am sure that what I have written would be understandable to your scientists.

134. G: What did you mean by the term "Chislo"? I'd better find it for you in your original notes. Then you can see the original context. S: Please keep in mind that these large missiles are all two-stage missiles and advise your scientists not to look for three-stage missiles. G: (Shows subject his original notes.) S: I see what you mean. Here is how this works. This means that the control circuits operate in a specific pre-set sequence during the rocket's flight. I have drawn up how these control circuits work. At first there were difficulties in controlling the exact current impulse feed at the right time, but this has been solved. Another interesting detail is that the gyroscopes which are so extensively used in rockets are gold-plated to avoid corrosion by oxidation. Platinum is also used to be sure that delicate instruments do not corrode. G: Here is the diagram where the "Chislo" is indicated. S: What that means is that

at different altitudes the atmospheric pressure changes, it drops as the missile rises and this affects the thrust. To maintain the desired thrust, the fuel feed rate is made to vary to obtain the necessary thrust, and this is what is referred to by "Chislo". Your scientists will understand this. It has to do with altitude and this system of Pitot tubes, and the pressure regulator provides for the correct thrust and speed of the missile thru all phases of its active flight.

135. S: All this began from the original V-2 of the Germans, whose scientists are still working for us. Speaking of Germans, you have seen how often Khrushchev threatened to make a separate peace with the DDR. He will not do this because it could involke a war. He is not ready to fire missiles now and he will avoid a war at this time. Even though he is giving rockets and training personnel to the DDR, they are still far from being ready to use them.

136. S: Incidentally, I have heard something you should check on: The Turks have sent some secret military mission to Moscow. I hope that this may have been done with your sanction but you should check to see if the Turks are not making some secret deal with the Soviets. I can tell you exactly when this happened -- it was between two and one-half and three months ago. The Turks had requested some Soviet specialists from time to time, which doesn't seem significant, but you'd better check on this Turkish mission to Moscow. I know this because the man who accompanied this military Turkish mission was a MVD officer who formerly was GRU and who graduated from the MGIMO one year after I did. His name is VOSKOBOY. He is now stationed in Turkey and he accompanied the mission to Moscow. I was supposed to meet him because he was bringing some things for me from Turkey. They were for my wife. I worked in Turkey with him a little before. He was here four days and did not telephone me, but my secretary, PODTEREVA, who now works for the Min. of Foreign Affairs, saw him on the street. His name is Alekseev. She asked him what he was doing there and he said that he was visiting his parents in Leningrad; but he had not been in Leningrad and he came with the secret Turkish mission to Moscow for four days. He has been in Turkey for five years now and has still not been replaced. You should check on these Turks. Of course, if this is a planned mission, that is different; and if aid from the USSR goes to all countries, that is good for us since it is a strain for them.

SHAPOSHIKOV, Boris Mikailo

b. 1882 died 1945.

Colonel of Tsarist Army during WWI - colonel.

Marshal since 1940.

one time chief of General Staff (1928-1931)

again since 1937 - to 1940

then Deputy Peoples Commissar of Defense

1943-1945 chief of General Staff Academy

Died 3-26-1945

[redacted]

137. G: Do you know SNOPOV or STAKH who were formerly in GRU and are now in KGB? S: No, I don't know them, but I told you yesterday that some 40% of the MIA graduates go to KGB. G: It would be very helpful if you could write up a list of your classmates and give all information about them as to where they went and what their present functions are. S: Show me a group of photographs and I will spot GRU officers for you. H: We will have this for you. S: Before my departure? G: Of course. S: Please try to arrange them in packages such as Soviet Embassy personnel in Turkey and also include the TORGPREDSTVO. By the way, I wanted to have a diplomatic passport just as I did when I went to Turkey, but they gave me only a service passport. (Subject shows his passport.) See, your visa was issued on 8th of April.

[redacted]

139. S: I spent many years amongst generals and marshals, even my wife's father was a general and my grand-uncle also; but his grandson, me, I'm only a colonel. I'll never be made a general, since my father was a White Army officer. G: I wouldn't be too sure. Look at SHAPOSHNIKOV. He had even been a White Army officer himself at one time. S: They don't trust me; they'll never make me a general. My problem now is to do our work and be ready to fulfill your orders. G: I want you to realize that the most basic consideration we have toward you is humanitarian, irrespective of how important you may be as a source of information. We regard you as an individual first of all. S: I understand you and am very grateful for this. It is quite different with us and many good people have perished. G: The difference in the systems is very simple to understand. All government leaders in countries of the Free World are servants of the people. We even use the expression that a man is in the service when he is military or in government work. In the USSR the government is everything and the individual is nothing.

Imp

[redacted]

140. S: I request that prior to my departure you have your experts look over the material I have submitted so that we can review it. We can work here together without sleeping and so can the experts. H: The problem is not only to find rocket experts but one who is a Russian speaker, and besides we are trying to keep this whole matter secure. G: We're going ahead very carefully with this even by consulting with experts, we must be sure that the knowledgeable people are kept to a minimum. S: In my opinion, this should be coordinated by someone high up in your general staff who understands how to handle this. Although there may not be many questions now, I'm sure they will arise later. G: You're absolutely right.

141. S: Tell me--do you think WYNNE did the right thing by not taking all my material when I offered it to him. G: Remember he is a simple mortal, and not an intelligence man. S: Don't tell him anything about this. G: Of course not, we are discussing it amongst ourselves. S: I gave it to him on the way to the airport. We were sitting in the back of the car alone and I knew that the car was "clean". He said he was afraid but he took the letter and one document. Later in the toilet he was frightened; he took it anyway but he wouldn't take anything else. Frankly, I was very disappointed in HERRIMAN and McBRIDE. They should have simply delivered my material to the British Embassy and their mission would have been completed.

142. G: By the way, do you know a man in your outfit called SOVVA. He only joined the GNIK recently and is presumably in KGB. S: I don't remember any such name. I know my own section perfectly but I don't know all the others. G: He's working in the German Direction. S: All their offices, some ten of them, are next to ours. I don't remember any such name. Our neighbors are everywhere in the committee--they are all over the place. G: Do you know who they are? S: Of course, I do. For example, their resident in our committee is Yevgeniy Ilich LEVIN. He is a colonel just like me. He is tall and handsome man. I know his depty.and I know his case officers. They also do the same thing that we do--I'm glad you asked the question. They and we coopt ordinary workers of the Ministry of Foreign Affairs and of Foreign Trade. They work for us; we pay them money; and they sign an obligation. We also do this with scientists and the women. I coopted MILOVIDOV. He is now working in the English Sector with BERDNIKOV. BERDNIKOV is the English Sector chief in our group of

[redacted]

143. G: What is your program for tomorrow? S: My program is as follows: I will get up at 0700 hours; after breakfast I will pick up my professor (KAZANTSEV); and we must be at the Soviet Embassy at 0900 hours. My cable is there now and I must get it released so that we can stay in London longer, not only to see more of England but to work a little longer with you, which is important. I don't think the Ambassador will receive me before 1100 hours and at 1330 WINNE will come by with his car and we will go to see something or other. After that we shall meet with WYNNE for supper and later we will be able to work together. G: At what time will you be able to come here? S: When would you want me? G: You tell us when you will be free. S: You know I'd like to walk around London a bit -- I haven't walked five meters yet. There are very many fine things to see in the stores and my wife has given me a whole list of things to get. There are beautiful vases made of porcelain. They cost about 10 pounds. When I was a regimental commander, we liberated a porcelain-manufacturing town -- the center of the industry in Czechoslovakia, and I brought home all kinds of porcelain vases and other items. They even gave a crystal vase to Konev and to me. Anyway, I have many expensive things at home, including rugs from Turkey, and I live on a high scale for Communism.

144. S: This aide-de-camp Buzinov to the marshal (VARENTSOV) is always broke. He has three children and he often asked me to take him somewhere, so, having money that my wife doesn't know anything about, I buy him cognac. He knows that when one is abroad there are always extra allotments in foreign currency, so he is not surprised that I have all kinds of things--that is normal. I like to live freely and now and then take a lady out. I know how to approach them and I never drink to excess like Buzinov. I say all this to you because I feel you should know all about me, and if you ordered me to stop doing all these

[redacted]

things, Id have to stop. You know what the moral views of our government are, and so far I've never been in any trouble, but all these activities require money for gifts, entertainment, etc.

145. S: Anyway, I got myself into debt and I wish you would consider how to reinforce my financial basis a bit. I've already thought of buying odds and ends here that I can sell at a profit there. I know some wealthy Jews in Moscow who can even handle diamonds. Whatever is too bulky, I may need to buy five or six navy sweaters and all kinds of other stuff. WINNE can bring that to me later, but if it is impossible, I would like to have more money to buy these things while I am here and as many rubles as you can spare to take back with me. Frankly, I have one debt of 1,020 new rubles. A good friend of mine gave me the money to get him, through my connections in Moscow, a suite of furniture. I ordered this and have the receipts to show but I spent the money gradually. How many rubles did you plan to give me? G: (Deliberately wishing to mention a lower figure than 3,000 we planned to give him, said about 1,000.) S: New rubles? G: Yes. S: Well you see that would just about cover my debt less twenty rubles and would leave me nothing at all. Well, I'll be able to buy the furniture since I have it ordered. I have just bought a new TV set, a Temp six, I used to have a Rubina. I thought of buying a small transistor radio here (Subject was given an operational transistor radio later). I swear by my daughter and my future work with you that I must do the following. I must bring each and every friend of mine some small item, since they know that I am going abroad. It does not have to be an expensive item in every case but it would be extremely bad to neglect anyone.

146. (Subject listed a long and wide variety of items such as fountain pens, neckties, ladies' nail polish, lipstick and a gamut of medicines for just run-of-the-mill friends, and more expensive specific items for influential friends such as generals, marshals, and colonels. As mentioned again in a later transcript, after this meeting was over Subject knocked on the door some 10 minutes after he left. He was dressed in trousers and his jacket over his undervear. He came to look for a notebook he lost, which fortunately, fell into the slot of the armchair in which he was sitting. This notebook was a most detailed, beautifully prepared list of items which

his wife prepared. It contained magazine clippings of all conceivable fine ladies' wear written out in red ink and itemized. There are also replicas of the actual foot sizes of his wife's and daughter's feet in the notebook. Subject elaborated on these items, which visually more than adequately supported his earlier statements concerning the items he was expected to bring back. In view of the fact that arrangements were made later for WINNE to bring back a suitcase full of items which Subject had planned to get through Customs with no check, it should be stressed here that many of these items would unquestionably have important operational significance, since they will be given to important Soviet personages who will automatically be valuable, unwitting informants.)

147. (In addition to friends Subject mentions who are prominent, Subject also had mentioned one assistant to Petukhov whose name is, Pavel Avrakovich OBOLENTSOV.) S: By the way, this name is famous, since he was the chief administrator under Molotov and now is the chief administrator for Petukhov. In my notes it says I should bring a light filter for his camera, as well as a hood. I am sure this will cost me 2 to 3 pounds, and although I did not receive money for this I cannot avoid bringing it. I've got to bring every girl and my secretary in all offices at least one item, even though it may be the cheapest lipstick in England. Even to GVISHIANI's secretary; I must tell you about him. He is my chief, he is married to the daughter of Kosygin. His father was a lieutenant general in the KGB. He was a Georgian. I think he is dead. His secretary, Valya, asked me to get some nail polish to match lipstick. If I don't bring this, probably Denis POLYAKOV, who is occupying a similar slot to mine, but in the US Direction will bring this. He has been in the US twice now with delegations.

148. S: By the way, I just remembered something important. We are conducting scientific intelligence against the US. For the assigned intelligence missions of the year, covering all conceivable types of industries, there were 150 specific intelligence targets listed. On each target there were supplemental questions - two, three, or more. The targets, broadly speaking, were non-ferrous metal industries, steel industry, all phases of the oil industry, etc. The interesting thing is that all U.S. targets were duplicated and transmitted to the

delegations going to Canada. I know this because I gave it to them with my own hand. Our letter specified that they should seek this in Canada because so much of basic Canadian industry uses US products. You should stop this. I will get for you, with all official seals, a complete list of all these espionage instructions given to our delegations. Other duplicate copies of this were also sent to other countries where US products are used.

149. J: I would recommend that we discuss his financial situation again tomorrow. G: Let us fix the time when you will come tomorrow. S: I just thought of something. If I could have a 1 carat diamond, exactly 1 carat, not more or less, I am sure that I could cash it in for 1200 rubles. Consider this, and possibly we can so work it out that you will not be concerned about passing any monies to me through contacts in Moscow for some time. G: We will consider all this and we'll talk about it some more tomorrow and will try to comply with all requests which are reasonable. S: Very well, I will go now and tomorrow let us plan on meeting between 2100 and 2200 hours. I'll try to come at 2100 hours if I can. S: Where is my key? (The correct key was found and given to Subject) (Subject left at 0140 hours on 22 April 1961) /

[redacted]

(12)

Meeting No. 4 at Leeds, England, 23 April 1961

1. By prearrangement in London Subject was to walk into the lobby of the Hotel Metropole in Leeds during the evening of 23 April 1961 whenever he could conveniently find free time from his delegation. The delegation was staying at the Queen's Hotel only two blocks away. G met Subject at the entrance to the hotel lobby at 2220 hours and escorted him to Room 31 which had been prepared for audio recording and which was occupied by Harold.

Tape Begins:

2. (As soon as Subject arrived he said that he was almost hospitalized because he had stomach pains. After visiting British firms in the Leeds area Subject, with his delegation, stopped at a small restaurant and Subject drank a whole liter of cold beer. As a result of this he developed pains which were some sort of cramps.) S: I thought I had an appendicitis but since they examine all Strategic Intelligence personnel and GRU every three months, I knew that I should have no symptoms of this. MAKHNOV (GRU doctor) examined me. You probably know him. I suffered for about two hours and WYNNE called a doctor. The doctor said that I did not have an appendicitis but if the pains continued I should be hospitalized in Leeds. He diagnosed my pains as an extreme kidney irritation due to my having consumed a large quantity of cold beer quickly. I feel alright now except that I'm a little weak from the anxiety of this ordeal. I was terrified about going to a hospital since the people back home who were not too willing to have me go in the first place would probably criticize me for doing this deliberately. They would say, "Why did he have to go to a hospital in England when we have adequate facilities here?" Now I feel alright and I think we can work a little while.

[redacted]

APPROVED FOR RELEASE
31 MAR 1992

[redacted]

[redacted]

at night. S: I see. Then it is up to you to decide on the hours.

4. S: I have taken some notes here but they are incomplete since people knocked on my door while I was writing. First of all, here is a note about target #1 which must definitely be blown up by a bomb of one or two kilotons. As I mentioned before, a five kiloton bomb is the smallest we have developed. I know this for sure since the Marshal (VARENTSOV) told me so. They have computed a one kiloton charge, but they have not yet developed the practical adaptation thereof. Your scientists can determine exactly what size charge is necessary to destroy target #1 (the General Staff complex), but it should be designed for extensive subterranean damage which could probably be effected by a shock wave if placed in the right position. The timing for this destruction is very important and I suggest that it should be several minutes prior to H-hour because later there may not be an opportunity. This destruction could be the signal for an all-out attack by other means such as aerial bombs and rockets. Of course, it can be done a few minutes after H-hour or even simultaneously. The KGB structures are mostly old buildings although there are some new ones. In between the four main buildings are many private dwellings with dark entryways. It would be simple for anyone to place a suitcase, an urn, or a spittoon there. No one would pay any attention to it there. If they saw a spittoon they would simply spit in it.

5. S: The best time to set the explosion for would be between 1000 and 1100 hours because all of the Command personnel would then be in the buildings. We poor workers begin our day at 0900 hours, but Command personnel with late breakfast engagements, etc., don't arrive until about 1000 hours. All cables and reports for daily business are brought in about 1000 hours. Remember the KGB has seven sub-basements. I know this because KOVALENKO, who is now a colonel and was formerly the adjutant to Pavel Artemyevich ARTEMIEV, told me this. He lives next door to me. He is now a KGB colonel who is charged with the protection of the PVO of the country offices which are scattered in Moscow. He graduated from the Frunze Academy and is a good friend of mine. I have often invited him to go out for a drink, but when I do this I always pay for his cognac. All KGB archives are also located in their headquarters and the entire group of buildings should be destroyed by about three bombs.

[redacted]

6. S: I will draw this up for you in detail and show you how easy it is to place charges in adjacent buildings, even in the GASTRONOM. A bomb could be disguised as a basket of fruit. (Subject then described the layout of the GRU buildings, Entrance #3, adjacent to the POLYKLINIK of the Ministry of Defense -- a three-story red brick building -- and particularly the pass bureau where packages, suitcases and the like must be checked in and left in custody while one visits the GRU offices.) S: An old lady takes care of this and there is even a toilet there which is little used. A suitcase could easily be left there since the toilets are in locked compartments. Then one could simply leave and it would be hours before anyone would notice it. Many packages are left overnight and during the day, officers even leave bags of groceries there to pick up when they go home. A simple round metallic tag is given as a receipt and the number of the tag is chalked on a suitcase until it is picked up. This would be a good place to plant a charge.

7. (Subject then continued describing the building complexes on Frunzenskaya and Naberezhnaya which house the PVO of the country, the GAU Headquarters, and other Defense Ministry Offices.) He suggested that two bombs would be sufficient to destroy this complex whereas four would be required to destroy completely the General Staff complex in the Arbat area. Subject then described the headquarters of the Moscow Military District only a few blocks from Subject's residence.) S: A huge underground shelter some 30 meters in depth with all living facilities and operating areas for the headquarters was built there during the war. (At meeting #6, 25 April 1961 Subject plotted all of these suggested targets and others, totaling 24, on a blown-up section of the Moscow map covering the center of the city.)

8. S: BERIYA was also brought to the basement of the Moscow Military District Headquarters, and was shot there by a Gen. KOZLOV in the presence of other generals. This building complex was surrounded by armored cars and tanks, all in firing positions, during the night when BERIYA was executed. There was some apprehension that BERIYA's KGB cohorts would make an attempt to seize this headquarters at that time. An important signal center is located in this headquarters now and there are switchboards for VCh lines as well as telephone machines. Incidentally, BERIYA's body was burned in gasoline in the basement of this building. (Subject then continued to briefly describe the other targets

[redacted]

for destruction which were later sketched by him in considerable detail in the map referred to above, during Meeting #6. MOSKALENKO's headquarters at Perkhushkovo was also cited as a target for destruction. Subject again repeated the incident of NEDELIN's death, adding that KHRUSHCHEV should be confronted with the lie since a great number in the USSR know the truth. As an example, there was widespread mourning in Dnepropetrovsk due to the fact that many of the personnel working at the launching site who also perished in the explosion came from Dnepropetrovsk.)

9. S: The PVO headquarters of the Moscow Military District on Kirov Street should also be destroyed. I mentioned this building to you before and I will draw a detailed sketch of it. One mine should be sufficient to destroy it. There is a similar headquarters of the PVO in other cities as well such as Khabarovsk where my grandfather-once-removed is stationed. There is also one in Baku. Kiev also has one and it overlaps the PVO defensive zone of Lvov. The PVO defensive zones have a Corps structure. There are no divisions in the corps. They have brigades which, in turn, are composed of regiments. I think this structure has all been written up, that is, I described the exact military complement of the PVO rocket units.

10. S: Another important target is the KGB Headquarters of the Moscow Oblast. This is located near the main telegraph building on Gorkiy Street. It is a huge white building, designated as the KGB of the Moscow Oblast. And, of course, as I mentioned before, all the headquarters of the military districts should be blown up, as well as the headquarters of the Groups of Forces. To cover them all would require somewhere between 18 and 22, each one assigned to place one mine. One man should not be assigned more than one task since the distances are too great between the headquarters.

11. S: As I mentioned before, it would be well to destroy all of the regional VOYENKOMATY also, since they have all the basic requisition plans for mobilization involving equipment as well as personnel. I worked in the headquarters of the Moscow Military District at one time and I know exactly how detailed these mobilization plans can be. If the regional VOYENKOMATY are destroyed, this would paralyze mobilization completely for a period of at least from D-day to D plus 90. This is the planning time for the first mobilization echelon; D plus 180 is the planning time for the second mobilization echelon into which even physically unfit persons may be taken.

[redacted]

15. S: I cannot arrange for WYNNE's expenses. He could get British industrialists to subsidize him, but even then I know we will buy very little at the exhibition. There are only two million dollars authorized to purchase specific items which are of interest to us, and that is all. They are restricting expenditures because money is needed for making rockets. WYNNE will hesitate to spend money advanced to him by the industrialists here since he lives on their small commissions. They give him only about 200 pounds per month. Therefore I wish you would consider this. It is an important matter. Please see if you cannot subsidize WYNNE. G: Don't worry about this. We will treat WYNNE very well. Everything will be taken care of, but do not get yourself involved in any personal dealings with WYNNE. We will take care of WYNNE separately. S: Of course, he asked me to help him, and he has turned out to be a very wonderful person.

16. G: Our clandestine relationship is one thing, but our dealings with WYNNE will be entirely adequate. It is something different and under no circumstances should you be involved in this. S: I felt it my duty to report this to you. G: Remember, he may inadvertently talk too much either here or in Moscow. S: He is afriad and will not talk. G: Remember he is inexperienced in clandestine matters. S: That's right, he is inexperienced. However, he did take my one letter and a document when I saw him off at the airplane. I prevented any KGB officer from approaching WYNNE at the airport since I had a pass and simply said politely that I was escorting WYNNE. Even though escorts usually stay behind the gates, diplomats are often escorted to the plane ramp, and I did also. He waved to me and I knew that the letter would be delivered. I even went to the second story of the terminal building and waited until the plane flew off. G: I assure you WYNNE will be adequately taken care of and everything you request will be included, but don't talk to him about this again. S: Very well, I won't speak about WYNNE any more.

17. S: I just remembered -- do you remember when I was looking at the picture of the KGB REZIDENT in London and I said VOROBYEV, Zhenya? It was actually IVANOV, Zhenya. However, there is a VOROBYEV there also. He is a naval man. The two resemble each other and when you show me the photographs again, I will point this out to you. IVANOV graduated from the Academy with me.

18. G: Now that you are through with your notes, let us proceed to our agenda. The first question is this: When you were at the Rocket Academy and studied the missiles about

which you have reported in detail, in this nine months course you say only tactical missiles were taught and no strategic missiles. Why is this? S: There was a general (OBZORNAYA) lecture on strategic missiles, but these were not called ICBMs. They were simply referred to as missiles with ranges above 1,000 kilometers. The Academy has prepared its courses for training officers in technical aspects of rockets employed by ground forces. These rockets are studied in great detail with all kinds of charts and diagrams.

19. G: Do you have a category of rockets which we call IRBMs which are of greater range than your tactical rockets but not as great as ICBMs; for example, say roughly between the ranges of 800 to 1500 kilometers? S: We have no such designation. We have only one division. Everything I have given you is under the control of VARENTSOV, and everything else including what you mentioned is under the command of the Strategic Rocket Command of the Land under MOSKALENKO. These are separate headquarters and they are always in conflict with respect to requests for budgetary allowances. The ones who decide are KHRUSHCHEV together with SUSLOV, and also MIKOYAN, etc.

20. S: Up to now VARENTSOV is still a Marshal of Artillery. Actually he should be by now Chief Marshal of Artillery, especially since NEDELIN's death. But they are not giving it to him. Incidentally, on the 2nd of September VARENTSOV will have his 60th birthday and my wife and I are invited to this celebration. SOKOLOVSKIY will be there and MALINOVSKIY will be there. There will probably be an overt order regarding the award of the Order of Lenin to VARENTSOV. Everyone will bring gifts. I already know which artists will be invited for musical entertainment. There will be souvenirs, albums, etc. I must also get him a good gift. His hobby is collecting watches. He has a collection of watches. I want to buy him a good, expensive watch, and have inscribed on it, "From the (Subject and wife's true name)". I'm going to be the major-domo, the bartender, etc., and the affair will take place at his house on the Frunzeskoy Naberezhnoy. He has a six-room apartment on the fourth floor.

21. G: To what extent were you told about the ICBMs? S: We were told that they exist and, as I have written, the basic characteristic is that they are two-stage rockets. Emphasize this to your scientists to spare them an analysis for more than two-stage rockets which do not exist. Next, the fuel capacity is much larger, and of course the overall space in the

rocket. There is more high-calorific fuel which is a liquid fuel. The only solid fuel we have is used for these free rockets which look like pencils. They must be very careful in handling these rockets especially when they are being loaded. There was an incident when a rocket had its frame slightly bent during loading and when it was placed in the launcher the friction ignited the rocket, causing casualties. G: Are they still trying to develop a solid fuel for rockets? S: Yes, they are trying to develop atomic energy fission. NEDELIN perished in such a test.

22. G: Are there any operational ICBMs at all, or are they only experimental? S: They are all experimental for strategic purposes except for the one I mentioned which is, as you said, of an intermediate range. This is the R-14 about which I wrote stating only that this rocket has now been included in our missile arsenal, that it has a range of over 1000 kilometers and that further data was unavailable to me. Otherwise the strategic rockets they have told me about, I repeat again, are two-stage liquid fuel rockets with a length variation between 18 and 24 meters. But I have never personally seen such a rocket or its installation. The basic objective is to have a high caloried fuel and to have all of the circuits and control mechanisms working properly with respect to each other; to reduce the deviation errors from the planned trajectory, or to correct the errors to a zero deviation position; and then the rocket can travel from one continent to another.

23. G: Now with respect to the rockets which are in production, where are their storage areas, manufacturing centers, etc.? You already mentioned that somewhere toward Murmansk there were launching sites. Do you know of any others? S: Regarding the bases (launching sites) in the general direction of Murmansk, only five or six people would have access to the location maps. One needs a special pass to go to the First Directorate (Operations Directorate of the General Staff of the Ministry of Defense). Even when I have to go to the Tenth Directorate (Countries of Peoples' Democracies), either I am met by the officer I am to see, after a phone call, or am told to go to a specific room or they may issue me a temporary one-day pass. Everything is done in a recorded manner. They are so strict about lost documents. There was one case where an officer was court-martialed for losing his working folio. Actually, two officers were enemies and one burned the working folio of the other and the one whose folio could not be produced was tried.

24. G: Did you have any inkling about rocket bases from conversation? S: This I can find out in the future now that you have advised me exactly what is of interest. If you will repeat this to me as EEI before I leave, I am sure I can find out. Even with VARENTSOV, conversation would not be as a direct answer to a direct question. But he tells me things like this -- "You know, they're not giving me enough funds. They even criticize me for having spent too much money for the erection of permanent-type protective shelters for artillery ordinance. Previously I was authorized to use canvas, but the canvas becomes weather-worn and disintegrates after a season, and that is a waste of money. So I built brick structures with permanent roofs, but the cost was criticized since the big priority for military expenditures is rockets." I have to approach him in a roundabout way, indirectly, to conversation we are interested in. G: As a suggestion sometimes this works well. One could mention that in the Western press one hears about accomplishments in new missiles, particularly in ICBMs, and the say, "Is it really true, comrade-Marshal, that they have everything and we have nothing?". S: That is right. He certainly would answer a question of that kind.

25. S: I give you my word, and I swear by my child, that he has so often told me "You know, (Subject's true first name), with respect to ICBMs, up to now we don't have a damn thing. Everything is only on paper, and there is nothing in actual existence." He was specifically referring to ICBMs. He continued, "For short ranges we can fulfill the missions, but beyond that what? There is nothing." G: I appreciate the fact that you probably would not have access to determining the exact coordinates of the launching sites, but would it be possible at least to find out from conversation that someone had been say, off-hand, at a place like Novaya Zemlya and who might say what an extensive rocket launching development there is there, should that be the case. S: There certainly could be conversations of that kind.

26. S: By the way, Marshal VARENTSOV is a very good administrator. He delegates many projected plans to his subordinates and then just corrects and supervises what what they have to do. I have friends in the Artillery Headquarters. Beginning with his Chief of Staff of the Ground Forces Artillery, KARIAVILI, a colonel-general, Georgiy Spiridonovich. He recently had a 60th birthday but because of the fact that he had quarreled with ZHADOV -- his former name was ZHIDOV but Stalin made him change to ZHADOV because ZHIDOV sounded too Jewish. KARIAVILI lives across the river from my house on the

Kotelnicheskaya-Naberezhnaya. Anyway, on his 60th birthday he did not receive an Order of Lenin, but only a gold watch. Incidentally, VARENTSOV was also there and the artists who were present are the same ones who are going to go to VARENTSOV's birthday party. I just mention this because that's how I know who they will be.

27. G: You mentioned ZHADOV. S: Yes, he is the Chief of Staff of the Ground Forces. G: Is ZHADOV in any way related to KHRUSHCHEV? S: No, there is no relation there. G: How about Marshal GRECHKO? S: GRECHKO, yes. He is married to some relative of KHRUSHCHEV's, exactly whom I don't know. But KHRUSHCHEV is certainly pulling him along. They say he is a fool. He did well on purely military matters before, but now in his present position as a deputy to the Minister, he is called a fool. Anyway, this is how ZHADOV spoiled things for KARIAVILI.

28. S: Now I told you before about an aide-de-camp PORUCHENETS -- a very intelligent artillery colonel, Vladimir BUZINOV. He graduated from the Artillery Academy, and is a very smart fellow. He is the aide-de-camp to Sergey Sergeyevich (VARENTSOV). His problem is that he is broke. He has three children and receives less than I do. His wife drinks and also smokes. Her name is Anastasia. I know because I visit them at home. He loves to drink too, and often I take him out because he is broke. He can drink up a half liter of cognac at a time. When he is drunk he talks a great deal. It is so easy to talk to him. All I say is, "What was all this excitement about on your last trip?", and he would say something like this, "Well, there were maneuvers; KHRUSHCHEV came down and MALINOVSKIY, the Minister, made a speech saying that he is introducing to the comrades marshals and generals, the Commander-in-Chief of the Soviet Union, KHRUSHCHEV." They call him that, even though his rank is still lieutenant-general. (Jokingly to G) - Just like your relative KHLOPOV. I promise to bring you his photograph. He looks just like you. This BUZINOV is not an adjutant who, in effect, is nothing. BUZINOV carries Top Secret dispatches and reports from VARENTSOV to the Central Committee. It is even possible for him to show me some of these items. Of course he would be entirely black in this respect, that is, unwitting. G: That is the only way he must be, strictly unwitting.

29. G: I have some more questions on subjects that need clarification. All these questions supplement the field of knowledgeability that you have already shown familiarity with. S: I understand what you want to know about rockets. All I can say is that the experimental effort now to make ICBMs is all based on those shorter range rockets which have already

[redacted]

been proven except that all dimensions would be proportionately increased. G: I just have a few written questions left and then it will be time for you to go. S: Yes, I better go soon but tomorrow I will go as early as you like and we can work for a long time.

30. G: Please tell us now all you know about atomic submarines. You previously stated that you were told that there were up to ten submarines already produced in a serial production. S: This I found out several months ago. G: This means that the submarines operate on atomic energy fuel? S: Yes - just like the icebreaker, Lenin. G: May it be assumed that they are continuing to produce additional ones? S: This I do not know. G: Where are these being produced? Do you know? S: Yes, I know this -- that separate components for the atomic submarine are made at Menzelinsk on the Volga, ~~about 30 kilometers from KAZAN~~. (Note: ~~Subject corrected this and said it was not Kazan but~~ Zelenodolsk.) This is 30 kilometers west of KAZAN on the Volga. Menzelinsk is the town 200 kilometers east of KAZAN which Subject previously reported to have been the eastern town of the former Moscow Military District.

31. S: During World War II this little town had a naval base established there. All kinds of naval equipment was mounted on vessels there. I almost married the daughter of the rear admiral who was sent to this town as the chief of the base. His home was in Leningrad. I used to see the girl, Masha, there (Menzelinsk). Her father has since died. There were also very large artillery ordnance plants there and storage dumps. At that time the Moscow Military District had a transient hotel there and my friend Col. Aleksandr Aleksandrovich MARENOV introduced me. He is now the Deputy to the Chief of the Political Directorate of the advisors to Hungary. The Admiral's name was Nikolay NETSVITSKIY. Earlier, I worked together with MARENOV in the Moscow Military District in the Political Directorate and he was chief of the section of the Komsomols. He is not an intelligence officer.

32. G: Very well. They equip the submarines here -- then what happens-- do they take them up the Volga? To another base? S: No. The atomic equipment is shipped in large packing crates to an assembly point in the Leningrad Oblast. G: Where in the Oblast? S: I do not know, but I believe it is somewhere in Leningrad or somewhere just out of town. In addition to Leningrad, there is also an assembly base somewhere in the Far East. G: Do you know if there are bases in the White Sea? S: Yes, there are. G: Assembly points? S: Of that, I am not sure. There are docks which receive the material from

[redacted]

Menzelinsk which are located in the Far East and somewhere near Leningrad on the Neva River. I just remembered something important. Near Leningrad they are digging extensive underground shelters for these docks or assembly points. They lead right to the water and are like pans, or rather like our Moscow subways. These are constructed very quickly.

33. G: How about the Belomor canal? Do they not take submarines up this canal to the White Sea? S: I don't know if they take them up the canal, but I heard that there are factories on the White Sea. A year ago when I was on vacation in Sukhumi at a sanitarium, I happened to stay at a former naval sanitarium. There are no longer any naval ones now because they have all been pooled together. However, there I met a certain first rank who lives in the very areas that you are talking about, north of Leningrad. I couldn't ask him exactly where, but he mentioned that near the sea there are secret bases where much activity is going on. Whether they build anything there or assemble, I don't know.

34. G: And do you know whether these submarines are equipped with rockets that can be fired even from a submerged position? S: Yes, they have rockets that can be launched from a surface position as well as from a submerged position. G: What are the ranges of these rockets? S: These are the P-5, and I believe that I have listed the range. The launching wave (BADISNAYA VOLNA) was determined. This is the wave which must be computed in order to eject the rocket through the water. They determined the height of this wave and under what wind conditions the rocket would deviate from its set course. G: Are there any other kind of submarine engines, other than atomic, that have recently been developed? S: The usual other motors are diesel but now they have very powerful ones. I know of no other types.

35. S: Incidentally, we were told that your scientists have not perfected the exact nozzle feed which permits the precise desire per second of fuel consumption with the admixture from the oxidizer. I described all kinds of nozzles in my notes. G: By the way, what do you mean by a SHNEKOVYYE nozzle? S: That is an orifice of a nozzle in which a float or a ball pulsates. G: I see what you mean now. It is like a ball valve. S: These nozzles operate to feed into combustion chambers through the space between the inner and outer wall. There must be an extreme precision because an imbalance in feed would cause a deviation from the desired rocket velocity. The work of these nozzles is to feed a constantly uniform mixture of fuel and oxidizer into the combustion chamber throughout the entire active portion of the rocket's trajectory. G: Do these

nozzles act as a carburator? S: No, that is a mixing chamber called a SMESITEL'. Then it goes to the FORSUNKI or pressure nozzles. I think I wrote all this up. This is the very soul of the rocket.

36. G: Would you have any idea of where atomic weapons of any kind, including hydrogen bombs, are stored? S: Where exactly, I do not know, but I have heard that there are two hidden storage areas in the DDR where atomic warheads are stored. Write this down. As to my source, Engineer Colonel of Artillery GRYZLOV, formerly the deputy to the chief of the 4th Faculty of the Artillery Academy imeni Dzerzhinskogo; there are now five faculties but at that time there were only four. Colonel PETRENKO is the chief of one of the Faculties also. GRYPLOV is now in the DDR and is the chief of the GAU there. This GRYZLOV is concerned with the establishment of these bases in the DDR. All of this is, of course, for rockets.

37. G: Now how about the bombs of any atomic type kiloton equivalents etc., what do you know about them and about where they are stored? That is the type that can be delivered by aircraft. S: I already mentioned that everything has been computed down to as low as five kilotons but nothing lower. There are 25 kiloton bombs and of greater TNT equivalent. There are also hydrogen bombs of greater than 25 kiloton equivalents which have been successfully developed and tested. G: Do you know where they are stored? S: I have no idea. G: Don't be disturbed. These questions must be asked.

38. G: Do you have any idea how many bombs have been produced at least in round numbers, say 10, 100, 1000 or more? S: I have no idea. All I know is that atomic warheads are stored in one place and the unloaded rocket shells in another. G: I'm not referring to just rockets. S: I understand. I also mean that all bombs of an atomic character, whether they be for rocket or other purposes, are stored secretly in various places. G: I realize that these are difficult questions to answer. S: If we could recruit SOKOLOVSKIY who is now retired, I think we would have our answers.

39. G: Here is an interesting question. How is your long-range aviation coordinated with your long and shorter range rocket commands? It seems that everything is subordinated so emphatically artillery, just how does long-range aviation fit in? S: I can say this, -- that KHRUSHCHEV has made an error which is in our favor. At first he emphasized an increase in aviation. I do not mean civilian planes or old models. All that is junk. G: I refer only to new strategic

aviation. S: He is still maintaining long-range aviation, but is keeping the production at a very slow pace. We call it our DD aviation, long-range aviation. He still maintains this, but even some jet fighter units have been disbanded. For example there was one in which MIKOYAN's son, a lieutenant colonel, was serving near Moscow. The entire division was disbanded. Capable, healthy officers were sent to the Dzerzhinskiy Academy to study rocketry. They are re-orienting some Air Force personnel to rockets. During the time I was attending there, they were still wearing their blue air force insignia before they changed to the black artillery insignia. You might say that today KHRUSHCHEV has now assigned a less important role to aviation.

40. S: In comparison to rockets, aviation now has a relatively lesser significance. However, combat strength of long-range aviation must be considered. They are still constructing long-range bombers, but not on the scale or in the numbers in which they had been building them previously, for example, under STALIN. STALIN had been all for aviation. G: Would you say that long-range aviation is being abandoned in favor of rockets? S: Definitely not. The fleet has been considerably reduced in favor of rockets, and much light aviation has been curtailed in favor of rockets. In addition, long-range aviation is not being built up as intensively as before.

41. G: Is the long-range aviation command entirely independent? S: Yes, they have their own headquarters. It is located as one goes past the crematorium and past the University of Friendship where YERZIN is an instructor. On the same street on the left-hand side is the aviation headquarters. Marshal ZHAVORONKOV is the chief. G: Is it not on the Leningradskaya Shosse? S: No, that is the Moscow airport and there is an air force command headquarters there. That is where at one time STALIN's son, Vasiliy, a lieutenant-general, was the chief of the aviation of the Moscow Military District. He has since been imprisoned. He is de-commissioned, miserable, and drunk. I'll tell you about him sometime and also about his (STALIN's) daughter. I know where they live. It is not far from the British Embassy. It is near the Novo-Arbatskiy bridge.

42. S: To sum up, aviation as a whole has been radically reduced in favor of rockets. G: However, is it correct to say that selected modern models of long-range bombers are still being produced and improved and kept up at least on a minimum basis? S: Yes, and their headquarters is on this street going toward the center of town. It is the Bolshoye Peregovskoye,

and across the street is the First Moscow Medical Institute. The statue of PEREGOV holding the skull is there.

43. S: Marshal ZHAVORONKOV replaced NOVIKOV. Remember NOVIKOV was removed just like KUZNETSOV, the former navy chief. I believe Marshal ZHAVORONKOV is also gone now. He became chief of the (GVF) which is also commanded by a Marshal of Aviation. I'll tell you who the new chief of the Soviet Air Force is. I can't remember now. NOVIKOV was retired for personal reasons. They don't simply discharge marshals. It takes a personnel action to do this. For example, ZHUKOV was dismissed, but by a personnel action by the Ministry of Defense, and was awarded a pension of five and a half thousand rubles. But the Soviet Air Force exists as an integral part of the Soviet Armed Forces. However, it does not have the weight that it used to have under STALIN. Now everything is subordinated to rockets. G: However, the Air Force chief must have under his jurisdiction those rockets which are air force type equipment, such as air-to-air and air-to-surface? S: That's absolutely right. However, surface-to-air -- that is in the hands of the PVO. Rockets like the ones I described which the MIG carries -- that is all under the air force control. These are the rockets that can fire an additional four to five kilometers beyond the maximum ceiling of climb of the MIGs.

44. G: Have any attempts been made to develop an atomic energy aircraft engine? S: No. All they are testing now is how to have a rocket engine work on the fission of atomic energy.

45. G: This finished the list I have. How about our meeting for tomorrow? S: Let us arrange to meet tomorrow about 2000 hours. G: That's fine. Then we can begin earlier and we won't have to keep you so late. I'll meet you in the lobby again as I did tonight. (Subject said farewell to all.) G: I'll take you down out of the hotel. Remember it is not so good to come in and out of hotels late at night since this is a small town, not like London.

46. S: What a relief it was to me when I was lying in misery to learn that I didn't have to be hospitalized in Leeds. Just think how hard it would be for us to continue our work with me lying in a hospital. G: Don't forget your key again so you won't be running back between hotels looking for it. Also, note the room number just in case. It is 31. (Subject left at 2335 hours on 23 April 1961, and was escorted by G to the street corner. He proceeded to his own hotel directly and without incident.

[redacted]

(13)

Meeting #5, 24 April 1961 in Leeds

1. (Subject entered at 2045 hours, having been met by G in the lobby of the Hotel Metropole. He said in English that they had visited the firms of Westall and Marshal and that WYNNE was now in the hotel shaving and getting himself ready to go dancing.) G: How about the other members of your delegation? S: Even on the 21st of April when I went to the Embassy and then met with you, the members of my delegation knew that I had intelligence mission assignments. In fact, it would be very awkward for them even to ask me where I am going. They also know that I am going to write up an efficiency report on them when I return and make my report on the trip. They even report to me. For example, when they were walking down the main street of London, Oxford Street, they saw WYNNE's wife walking in the company of a young man. Earlier when WYNNE had arranged the initial reception for us, his wife was present so my people had met her. They told me that I should know, and I told them that it's none of their business and none of my business. I recall that when I was sitting at the table with her she mentioned that she had two brothers. G: Very likely she was with one of her brothers, and I don't think you should pay any attention to that. S: Well, I thought I should report it to you. I didn't bring any notes because I had no chance to write anything this morning. I came to you now right after I washed up.

2. S: However, let me begin by telling you what's on my mind before I forget. First of all, in the Ministry of Defense there are twenty-eight thousand employees. In general they are distributed as follows: The General Staff on the Arbat, the three buildings on the Frunzenskaya-Naberezhnaya, the second house on Red Square, and the Air Force Headquarters on the Bolshaya Pirogovskaya. This complex has twenty-eight thousand persons, including officers and civilians (VOLNO-NAYEMNYKH). Of the latter, by my estimate, there would be two and a half to three thousand. This would include cleaning and household personnel, as well as stenographers and civilianized officers.

3. S: Many GRU officers who still have potential value have been retired at 40 to 50% pension pay, depending on their calendar length of service, and they are hired as civilians. For example, I have twenty-four calendar years of service including my officer training time, but my total service (L'GOTNYYE) is twenty-seven years because my war service in the Finnish War and in World War II are given double value. (with preferential terms)

APPROVED FOR RELEASE
31 MAR 1992

[redacted]

[redacted]

kind of pass, except that the cachets vary in terms of the pass permission to go into specific General Staff buildings. With my pass I can enter all the buildings. But in the First Directorate I have to be escorted from the reception desk, and for the Tenth Directorate I must make my appointment by telephone before I arrive.

7. S: Now, before I forget, the KGB complex at the Dzerzhinskiy Square including the large building above the GASTRONOM -- and this includes the personnel of the First Directorate there which keeps track of us -- I would say that together with civilian employees, they have between five and a half thousand and six thousand workers. This is not an exact figure, but I think it is a good estimate.

8. S: Now the APPARAT of the Central Committee has expanded considerably and it includes all kinds of sections. They have independent sections of light industry, heavy industry, military and administrative sections .....let me see, their exact title is sectors. That is what they are called. There is one for agriculture, electric power, and there is even a commission which handles all personnel who are being sent abroad. I was also interviewed by the duty officer there before I could go to England. Although the Committee is large, one, two or three interviewers question a particular prospective traveller, depending upon the importance of the individual and the mission. They brief people on behavior abroad and question them on what they expect to do. Then they fill out a Top Secret form.

9. S: The first page of this form is a declaration which I must sign. It reads something like this, "I, (Subject's true name), about to go abroad, promise to maintain the dignity of the Soviet Union as the representative thereof, promise not to enter into any contacts or discussions which are not authorized, and to maintain state secrecy." On the opposite page are all vital statistics on the individual. This includes his Party record. The whole document is Top Secret. The reason is that according to our advertised democratic principles, this type of treatment would be improper, so they make it Top Secret. The pretense is that a specific ministry simply sends someone and the Central Committee has nothing to do with it. But this is absurd. Of course, a ministry may nominate a person to go abroad, but then everything is checked minutely by the KGB. When their acquiescence is obtained, the Central Committee commission takes this Top Secret obligation from the individual and then permission is given for the issuance of a diplomatic passport by the Ministry of Foreign Affairs.

[redacted]

[redacted]

[illegible]ent times -- has at least 5,000 persons including officers.

40. S: The other OBLAST headquarters and the groups of forces may number up to 4,000. This also includes the headquarters security battalion which guards all entrances, safes, etc. of the headmasters. This also includes the headquarters service company and quartermaster elements serving the headquarters itself. We have eighteen to twenty-two military districts, say twenty for an average. Therefore there would be about 100,000 in all of the OBLAST headquarters together with the groups of forces. Let us now check the figures I have here: The General Staff of the Ministry of Defense - 28,000: the Central Committee of the Communist Party of the USSR - 5,000: the KGB - between 5 and 6,000. Also add to this the naval forces and their GAU since I did not include them in the 28,000. At any rate for an average of this total group in Moscow, lump it together at 50,000. Therefore this total of 150,000 experienced generals, officers, and men of the headquarters in the USSR must be destroyed, according to the plan which I have proposed.

41. S: Please consider my plan and report it to your headquarters. No doubt destruction has been considered by them as an inevitable action in case of war. Perhaps my grasp of the whole problem may be inexact and requires much adjustment and reorientation. I am ready to accept any assignment to blow up what I can in Moscow (any assignment which may be given to me). Wiser and more experienced heads will probably come up with a better solution than I have offered.

42. S: I would like to suggest another possibility. This is something that should be prepared scientifically. Your scientists may consider this. The mines with TNT atomic equivalents should be concealed in a device for example, such as the standard Moscow refuse cans which can be found in every house entrance. A false bottom should be prepared in this. I should be able to set a time mechanism for the desired detonation time at the bottom of such a can which is loaded with an atomic mine. The materials should be obtained in a Soviet store so that these cans resemble Soviet cans. Then the prepared material can be sent by means of heavy diplomatic packages and passed to me through dead drops. Then assume that I can concentrate all this in the basement of my DACHA. These cans or spittoons I can haul either in suitcases or better yet in the trunk of my car.

43. S: If I were assigned the mission of blowing up seven targets, this may require some fifteen mines. I could run around and set all these in the proper places. It may require several trips to get them all placed. But I could run back

[redacted]

[redacted]

forth as if I am shopping. I could even have some items placed in the suitcase. These I could leave at the baggage storage area I described to you or in the proper driveways -- with everything set by a time mechanism. This is what occurs to me. Maybe the whole scheme is very primitive in your eyes, but to me this seems to be one of the first essentials of our common mission. G: Your intentions are very fine and when the time comes to consider this, your proposition will not be ignored.

(44) S: The destruction of such a group of military and Party leaders as are included in the 150,000 I mentioned, would cause immediate capitulation. Of course this may not get KHRUSHCHEV who may be at a DACHA of his. He has three. One is near the Moscow University, another is on the Rublevskiy Shosse beyond Kuntsevo, and the third one is near Dmitriyevo. At any rate, the whole Party APPARAT and the General Staff can certainly be destroyed. The Praesidium is in session all the time, irrespective of where it sits. I will get you a copy of this internal telephone directory; I have it at home already. Even though you are interested in names and patronymics, at least you will have all the initials here.

(45) G: We have a lot of questions here we would like to ask you. Even though you may not answer all of them, just explain whatever you can. S: Very well, but first let me answer the two questions asked me yesterday which I did not answer. Yesterday you asked me about these nozzles or fuel injectors (FORSUNKI). In my report I wrote up very carefully and exactly in engineering terms everything there was about it. I don't know if you're testing me about this item, but all I can say about them is that the principle involved is for these types of nozzles -- which by the way are considered to be very reliable -- to feed the exact mixture of fuel ingredients into the combustion chamber of the rocket. These nozzles must feed in such an exact way that no overheating occurs which could cause premature ignition prior to getting the precise feed into the combustion chamber, that is, to permit the exact per second quantum of fuel to enter the combustion chamber. Failure to do this will cause an incorrect thrust throughout the active period of the rocket trajectory. Yesterday I didn't understand what you were asking me about exactly. But this is what I know, and further than that I cannot give scientific data since I am not an engineer. G: You explained this well, but yesterday all that was asked of you was to describe a type of fuel injector which was the ball-type and you did that clearly.

[redacted]

[redacted]

coordinates of the target. In the past it would take us more than six days to complete this but now they have developed techniques for completing the topographic survey in two days. The second most complicated process is to test and check the rockets so that they will follow the indicated trajectory. There are four basic tests, horizontal tests, in the test area and then additional tests on the launching pad itself.

62. G: Were there any naval officers or air force officers in your class? S: Yes, there were. G: What would be the proportion of these to others in the army? S: They were fewer. There were either eight or ten air force officers and there were only a few naval men. But there were also engineers from the Kuybyshev Academy which is also in Moscow, not far from the artillery academy. The engineers are responsible for construction of shelters and protective partitions at the launching sites. But there were only a few engineers in this course. G: Would you call this a general course? S: Yes. G: Can't you remember any of the names of the faculty chiefs? S: I'll write this all up, but I'll try to tell you now those that I can remember. I suggest that you give me the names of all Soviet artillery men in the DDR and I'll tell you whom I know.

63. S: Yesterday I told you about GRYZLOV, a colonel who is there now. There are several Soviet armies in the DDR. One army is composed of armored forces. The commander of each army has his deputy for artillery. This artillery commander has his staff through which he commands rocket artillery, and that portion of rifled artillery which is still retained. Hero of the Soviet Union, Gen. Mayor of Artillery Ivan KUPIN at one time was the deputy to the Chief of Artillery in Lvov, the Sub-Carpathian Military District. For the past two years he has been the commander of artillery of one of the armies stationed in the DDR. That was the armored forces army. Now he has just been assigned as the deputy to Gen. Polk. FROLOV who is the chief of all Soviet artillery of the GSPG. In the field there is no such sub-division as chief of rocket artillery or conventional artillery. It is all under one command. He is in charge of all depots, firing ranges, ordnance shops, etc. and he has his own GAU for operating all this.

64. G: When you mentioned GRYZLOV who was sent to the DDR to organize these new rocket units -- to whom will they be subordinate? Will they be under FROLOV, or will they be turned over to the Germans? S: No, the Germans are receiving rockets

[redacted]

[redacted]

...he Germans have their own artillery personnel ...rs. We are training them, but the Germans will ... own tactical rocket units. We have been training ... a long time now, and now they are receiving rockets. ...der states that they should have rockets in their hands ...he end of 1961. There are four groups of forces of ours, ...d there are many countries of Peoples' Democracies. We ...have advisors in all headquarters of the armies of the countries of Peoples' Democracies, but I do not count these. Special training units for rockets are being trained by our people.

65. S: I know that in our Soviet forces of the GSFG, Group of Soviet Forces in Germany there are exactly four brigades of rocket artillery. Two of these are designated as atomic weapon rocket brigades and the other two are normal rocket brigades, that is, high explosive. This is in Soviet hands and will not be given to the Germans. But the countries of Peoples' Democracies will have their rocket units trained by us and they will be armed with rockets, that is, with the exception of Albania. Possibly CASTRO has received some rockets also, but I am not sure. G: Do the other Soviet Groups of Forces have rocket brigades of this type or not? S: They do, but to a lesser degree. I don't know to what extent. I am glad you ask these questions since you are teaching me what is of importante for me to find out about.

66. G: Can you tell me what type of rockets were given to the Germans? S: Yes, I can. The R-11, and now they are giving the SP-5, and in addition, all types of free rockets such as LUNA, MARS, KORSHUN, etc.. G: They already have these such as the 3R-1, 3R-2, 3R-3 and 3R-7? S: Yes, they have all these, possibly as many as 10 types, but I don't know in what quantities. They are preparing tactical launching sites and they have already trained cadres to whom live rockets are being given. G: How about atomic warheads? S: No. These are not given. All we have there are these two atomic storage depots for our two brigades, which are hidden somewhere and are under the control of GRYZLOV.

67. S: Another officer I know there is Col. Georgiy KHOROSHILOV who graduated one year before I did, in 1938, from the Second Artillery School in Kiev. After the war he was a senior lecturer at the Dzerzhinskiy Artillery Academy, in the tactics department. Now I have heard that he is the

[redacted]

[redacted]

71. S: Anyway, the situation there is very unpleasant for our forces. For any relation with a German girl, a soldier gets shipped home at once and is punished. In addition, they have cut down the monthly allotment of marks given to officers. When I was in Turkey and was allotted 2,000 lira per month, I would buy all kinds of things, which I did. I brought them home, sold them and traded them. Although there are all kinds of goods in the DDR, the new reduced allotment in marks permits the officers to buy very little of value. Anyway, these are my friends who tell me of these conditions.

72. S: They always call me when they come to town. Gen. KUPIN stays at VARENTSOV's house when he comes here. His daughter has now given birth to twin boys so VARENTSOV is the proud grandfather of two five-year old boys. I also have to bring them little gifts. This is a must because when Gen. KUPIN goes to Germany he brings back a toy for my daughter. VARENTSOV's third daughter is Natasha. She is in the third grade with my daughter, Galina, who is about two months older than she is.

73. Yerlena's husband, Leonid, is a captain and he is now graduating from the Command Artillery Academy at Leningrad. Prior to that he had served in the DDR as a lieutenant. VARENTSOV arranged for him to go to the academy. He comes from Taganrog, and right now I can't remember his last name. He hopes to go back to the DDR after graduating, but he is well off since VARENTSOV gives his daughter a gift of about 1,000 old rubles per month. The boys are named Sasha and Serezha. The marshal lets them stay at his DACHA with his wife (grandmother), and when they go to Leningrad they stay at a common apartment. The marshal has two servants, flower gardens, and his own personal car.

74. S: Yerlena is spoiled since her father gave her everything, not like poor Nina who shot herself and whom I buried when the marshal was in a Moscow hospital. I didn't tell him anything until it was all over. He had a very beautiful first wife, Anya, who died of tuberculosis. Later he married his present wife, Yekaterina KARPOVA. He whisked her away from a Leningrad doctor to whom she was married at the time. It was when VARENTSOV was recuperating and KONEV was demanding his earliest return to the Front, the First Ukrainian Front, as chief of artillery, that Nina's husband was shot together with two others who were engaged in black marketing in Lvov. It was proven that VARENTSOV had no personal interest in the black market deal whatsoever, but he was accused of political shortsightedness in allowing this to go on under his nose. He was called before the Minister of Defense who reprimanded him. However, the Minister said, "Let us forget this whole matter; go back to the front." Three months later VARENTSOV received the Hero of the Soviet Union.

[redacted]

[redacted]

75 S: When he was going to the front by rail I accom-
ied him, and it was then I told him about the unfortunate
tuation with his daughter. He was emotionally upset. When
we arrived in Kiev we learned that CHERNYAKHOVSKIY had been
killed at the front. He was one of the army commanders of the
First Ukrainian Front. He was a very close friend of
VARENTSOV's. This was in March of 1944. When we arrived in
Lvov he visited the cemetery once and never returned. Later he
gave me five thousand marks and said to order the best possible
monument in Vienna to place on her grave in Lvov. Anyway, that
is the story of a good friend of yours, that is, he is a good
friend of yours indirectly, through me. I am going to buy him
an expensive watch and inscribe it from my wife and myself. I
can photograph this watch and send you a picture.

76 G: Now we have some questions based on the informa-
tion you gave us that we would like to clear up. S: I tried
to present everything as honestly and completely as I could.
Let me finish one other question. You asked me how I got into
GNTK. I finished everything on VARENTSOV.

77 S: On the 5th of January 1960 General SHUMSKIY (Note:
Deputy Chief of GRU Personnel) called for me. He said, "Here is
the information submitted to us by the KGB on your father". By
the way I would appreciate it if you would check to see if my
father is still alive, since he disappeared without a trace.
We know that there was an encirclement at Rostov but it would
not be difficult to have escaped from there to Taganrog. G: We
will run a check. S: Secondly, possibly through your informa-
tion channels you may find out if anybody had reported on me
about my father. Thirdly, you may know that there were some
records in the German archives which fell into the hands of the
KGB and which they have been analyzing for years. Our people
don't know what to do with me about this matter. They can
openly discuss me without arresting me but if they did not give
me a passport to come here now I would have made a run for it
somewhere, possibly to your Embassy. G: If your father is
alive and is either in the US or in England, this can be
quickly checked. S: I don't believe that he is alive but
please check anyway and also let me know if you find out who
could have reported on me.

78 Anyway SHUMSKIY called me and said, "Your father was
a White Army officer and had a higher education and your
grandfather was a nobleman, a Judge in Stavropol." My uncle,
once removed, was also mentioned. He was once a commander of a
PVO regiment in the Far East, and at one time he was also in
prison because of his background. His name is Valentin

[redacted]

[redacted]

#5

Antonovich (last name same as Subject's). After he was released from prison he was then the Chief of Staff of the 21st Army during the war. Then he was the commander of the 6th Guards Army. NO Then at the end of the war he was sent to the Far East and he participated in the campaign against the Japanese Kwantung army. He remained there after that and became the Chief of Staff under MALINOVSKIY. When MALINOVSKIY finally was brought in to replace ZHUKOV as the Minister of Defense he left my uncle out in the Far East since he knew the area well. He avoids contacting me and I do the same since we do not wish to contaminate each other with our backgrounds.

79. S: When SHUMSKIY confronted me with all this he ordered me to write up my version of it. I told him that I could only write what I had always written before about my background but possibly my mother could add some supplemental information. My mother wrote a statement and I submitted it but they immediately stopped my processing to go to India as the RESIDENT. I should have gone as the military attache but instead they sent some general who has no diplomatic or other background. He has no higher education but he has a good war record. When this was done I had no assignment for a month, then two, and I was worried -- I was the GRU reserves. This all happened after I had finished the advanced rocket course. It was very lucky that I had been to these courses, otherwise I could never have gotton this information for you. You would have had information only about the GRU.

(80) S: I was sitting worrying during these two months and I felt that the big break in my life was going to take place. I had already stolen or copied the material from the academy. The reason I had done this was because I was already distrusted. They would not return me to my post in Turkey after I had this affair with General SAVCHENKO who had also made charges against me. I felt insulted by this and wanted to go to Turkey very badly since I had a wide circle of acquaintances, including Colonel PEEKE, within the diplomatic colony. I had already made up my mind to approach you, but was biding my time because I was taught to be careful. So I wanted to collect this material because I thought it would be useful in the future when I had the opportunity of approaching you.

(81) S: I became the sergeant major of the class since I was the senior colonel. There were six or eight other colonels in the class. The rest of them were lieutenant colonels, majors, and there were a few captains. So I copied everything word for word but had to use abbreviations. Later at home I

[redacted]

wrote out all abbreviations so that you would understand them. The only place where I did any short-cutting was in describing certain launching site equipment because after describing one in detail the other types were similar.

82. S: Anyway, I was doing this for almost a year, and then one day when I was the duty officer, the POWERS incident took place. I told the students about this. When I was the duty officer I had all the room keys but not the safe keys, because the safe keys are submitted and placed in a sealed box. At that time I wasn't thinking of opening safes, but now if you can prepare me a similar seal I can open safes. That night I made my rounds and took turns with my assistant, sleeping. During this time I had some blank cable paper and I copied down the code names from the Red Book. Later at home I typed them up in the form in which I gave them to you. Of course they could trace me by my typewriter, but if it went to that extent, I would be shot anyway. I was nervous while copying though I was alone at the time. At any moment a special high-ranking duty officer such as a general from the First Directorate of the General Staff could come in. There were all kinds of special cables that could come in at night, but particularly dealing with information about your overflights. I knew when your planes were over Kiev.

83. S: Anyway, I was the duty officer during the night from the first of May to the second of May. The tour begins at 1500 hours. No sooner did I accept the duty when in came the communication saying that an American pilot had been taken into custody from a knocked-down U-2, and they described the circumstances which I know exactly. When POWERS was flying near Sverdlovsk, the poor fellow had the misfortune of running into a battalion of V-75's. He did not fly directly over the position, but slightly to one side of it and was already being followed by a MIG-19. The pilot was a lieutenant. The battalion on the ground was on an alert because of the holiday, and they opened fire. They were firing a defensive barrage since they were alerted that a hostile aircraft was flying overhead.

84. S: No direct hits were made, but only a slight damage to the tail and wing assembly. The damaged parts were not shown at the Moscow exhibition and your intelligence personnel should have spotted that. He was within the radius of explosion and as the result of the shock wave from the explosion, the plane was damaged and poor POWERS sustained a concussion. I don't know what he reported to his parents or others, but while falling he blacked out several times. He was

[redacted]

not conscious when he parachuted to earth nor when everything on him was seized. The claims of a direct hit were, of course, absurd. I reported this to you already on the twelfth of August of last year, as well as on the RB-47.

85 S: POWERS was brought to Moscow by plane and the KGB at the moment didn't have an English interpreter. I was supposed to talk to him since I was the only one around who had some sort of understanding of English and I had already reported the incident to some generals. If they had not found a KGB interpreter at the last minute I would have been the first one to interview POWERS. They called up that I wasn't needed and the KGB chief, this young fellow who was the KOMSOMOL chief, and who replaced SEROV, SHELEPIN, wanted to make the report to KHRUSHCHEV personally. So he got an interpreter and picked POWERS up. But military people knocked POWERS down and POWERS was considered to be a military man. Therefore, he should have been turned over to us, the General Staff. But the KGB seized him, took him to Dzerzhinskiy Square, and made their own report. He was being treated medically since he was still in shock. You could have traded POWERS for this MELEKH whom you were in such a hurry to release.

86 G: How is it that SEROV had no influence? S: SEROV has none. If it weren't for the fact that he is remotely related to KHRUSHCHEV, he would have been shot for his past association with BERIYA. He was in a position of minister, but he had a chance to save his skin and was made chief of GRU. SEROV is not the most brilliant man. He knows how to interrogate people, shoot them, and imprison them. Although he has studied the intelligence situation, ROGOV, as his deputy, does most of the executive work. The other Armenian, MANSUROV, is simply in charge of the household and administrative functions. So I am glad to have the opportunity of telling you the true story about POWERS. If he had arrived in Moscow a half hour earlier, I would have been the one to interrogate him, even though the translation may have been cockeyed.

87 S: If we had only made contact sooner I would have told you all about MELEKH, that he was a Soviet spy and an intelligence officer, and you certainly should not have let him go. You could have sentenced him to be shot, and you could have traded him for POWERS. When the original bail money was put up KHRUSHCHEV made the decision, not SEROV. It was $50,000, even though it was later returned. SEROV can make a decision only for about $2,000.

88. S: SHTEMENKO did a great deal when he was chief of intelligence. He made a lot of wise reforms. He even had an

[redacted]

elevator installed. However, he was a disagreeable man and was not generally accepted by other members of the General Staff because SHTEMENKO was a favorite of STALIN's back in STALIN's days. He did not fight on the front, but visited on the various fronts and collected decorations. After STALIN and BERIYA, SHTEMENKO was reduced in rank to a two star general. Only after he was made chief of the GRU did he receive his third star. Of course he was a good administrator and he did set up this sabotage school. Under SEROV, the directorate and section chiefs do all the work.

89 S: On the fifth of May after POWERS was knocked down, KHRUSHCHEV ordered a suspension of agent operations to avoid a possible flap. At that time I was running an agent about whom I will tell you everything. He was obtaining data on electronic computing machines through a third party and we were getting the material via dead drops. I had to stop this. There were many protests about dropping scheduled meetings and other contacts, but it had to be done. The REZIDENT in Pakistan decided on his own to pick up material from a dead drop which was already loaded in order to avoid possible compromise to the agent. He did this but was severely reprimanded by his superiors at GRU, even though he did the right thing. Thus KHRUSHCHEV ordered cessation of agent contacts during the period when he was going to capitalize on the POWERS incident despite the damage it did to the agent nets. That's all I have to say. I am ready to answer your questions.

90 G: Are the 3R-1, 3R-2, 3R-3 and 3R-7 now in serial production: S: Absolutely, and in addition, they already have atomic warheads developed for them. G: Were all these shown in the Moscow Parade of 1960? S: No, not all of them. I'll tell you which ones. They were the 3R-1, the V-75, the R-2, the R-11 and the 3R-7? I am checking these from the pictures. H: How about the P-5? S: This was not shown in the parade. G: Were you ever at the parade? S: No, but I was at the training areas where everything is prepared for participating in the parade in proper sequence. This is off Leningradskiy Shosse. The whole parade is rehearsed by sections under the direct command of the unit commanders. G: How long has it been since these rockets were placed in the hands of the troops? S: The R-2 existed even in STALIN's time, but it was not fully developed nor was it in mass production. These others have been in production relatively recently. I would say that they began to give them to troops about four or five years ago.

91 G: What is the principle allocation of these rockets? Is it to the front or the army, or what unit? S:

[redacted]

In case of war, the units which operate rocket artillery of large caliber, long range, i.e. the battalions which are part of brigades similar to those now deployed in the woods near Moscow, not the PVO, but the strategic long range rockets, will be commanded by the Chief of the rocket forces of the General Staff, as is now established. These tactical weapons will be in the hands of the ground forces Commander and through him VARENTSOV, and their direct sub-units such as a Front, like FROLOV's in Germany and his artillery of the front, then the artillery of the army. The battalions will be parts of regiments which in turn will be part of a brigade. In case of war, the army artillery will have these weapons under its command. However, they will be exclusively of the conventional type because the employment of atomic weapons will be the decision exclusively of the Central Committee of the Communist Party through the Ministry of Defense. The atomic weapons will be deployed in such locations that, when their use has been authorized, the weapons will not be far from the units which could employ them.

92. G: The next question of course will be difficult for you to answer, but it states, Do you know of any actual locations where nuclear warheads are stored, or do you have any knowledge where production centers are located? S: Of course I do not know and one can find out only by chance conversation. There are, I have heard, assembly points for atomic warheads in the Klintsy area, but where I do not know. Generally, the hollow rockets are stored separately in entirely different areas and only when they are to be used with atomic warheads are both they as well as the warheads brought to some forward assembly point.

93. G: In your course at the artillery academy, were the P-5 and the SP-5 studied or were they merely referred to? S: I wrote about this as a supplement. We saw a model of this rocket, but it was not in a cross-sectional form. The data I wrote about was given to me by BUZINOV. G: However, are they included in the five-year course? S: Yes, they certainly are. G: Did you ever see the R-5? S: Yes, I have, and it is not in serial production. It is mounted in our laboratory and I have seen it in a canvas cover. I measured it by pacing and I estimate it to be between 16 and 18 meters long. This is a bigger rocket than the R-2 or the R-11. G: What unit will these rockets be assigned to? S: Will they be in brigades just like the other rockets? G: Were these shown at the parade? S: No, they were not. Just an old experimental model of the R-2 was shown. The largest test area is in south Siberia. The center is Kapustin Yar, and the impact is Kazakhstan.

94 S: I have an excellent source of information on this area a captain who is a friend of mine. I met him in the following way. The man's wife came to VARENTSOV's aide-de-camp and said that her husband had graduated from the Dzerzhinskiy Artillery Academy and was being assigned to Kapustin Yar. He had served there in a junior officer capacity prior to having attended the Academy. The woman was a student at a medical school and wanted to remain in Moscow to finish her studies. In?

[redacted]

[redacted]

addition, she would have to give up her room which was a nice one, since this was allotted to the family while the husband was at the academy. Her request was for help in getting her husband transferred to Moscow. His name is Vladimir KASHIN. He is an engineer-captain.

95. S: Well this BUZINOV, it seems to me, took a liking to the lady. He already had trouble in this direction once before. He flirted with some officer's wife in Leningrad, and the husband made a scandal as the result of which BUZINOV received a Party reprimand. If it weren't for VARENTSOV he probably would have been thrown out. Well anyway, I don't know how far his interest in this lady went, but it is common practice that all generals have girl friends, even Gen. Leyt. SMOLIKOV of GRU.

96. S: He came to me and said that this captain should be helped. At that time I was working as the chief of this acceptance commission for the incoming class of the MDA. I saw his personnel file and it was very outstanding. As a student at the academy he had even invented some device which was of value. To take a graduate of an academy who has specialized knowledge into the MDA where he would merely study languages and intelligence matters would be a very desirable thing to do. This is far better than to take an intelligence officer and try to make a specialist out of him in a field in which he could be given an intelligence mission.

97. S: Capt. KASHIN arrived in Moscow on a visit and with him came the firing range chief of Kapustin Yar, a colonel. He was just the post and station commander who provided administrative and housekeeping support. There are generals there who are in rocket testing in various categories. There are specialists who check various instruments and KASHIN, who is an engineer, is in charge of a small section there. Of course he knows what happens when they test rockets. I invited him to my home and found him to be a very fine officer. He asked me to help and I asked him if he wanted to be an intelligence officer. He said he wanted to very much. So now he is a candidate for the school. Whether he will be accepted or not, I don't know. I also told him that if he were not accepted in the MDA, I could get him an assignment in the laboratory of the Dzerzhinskiy Artillery Academy. I think that he will probably be accepted by the MDA since his record is good.

98. S: In my discussions with him about what is going on at Kapustin Yar, he told me how often the guided missiles tested were way off their planned course. In the future I will know

[redacted]

now how to ask him about the vital details which you are interested in. I will surely get him into one academy or the other. He will be my good informant since he has much respect for me and I am doing all these favors for him. I will get all the information out of him on Kapustin Yar. G: What is his full name? S: He is Vladimir -- I think his patronymic is Mikhaylovich, but I am not sure. It is hard to say where he will do us the most good. At the MDA he can't tell me very much except the names of some of his classmates and I can get information on the GRU myself. At the Dzerzhinskiy academy he may be able to tell me of new rocket developments. Anyway, so much for that.

99. G: Let's check the time. It may not be good for you to go home too late. H: Ask him if there were many people on the streeet when he went home last night. The question is going in and out of the hotel. G: You may be conspicuous if you come home late. What is your program for tomorrow? Will you have time for a meeting with us? S: Tomorrow we're going to look at a machine factory, but then we have a program in the evening. G: I better explain our future plans to you. We cannot meet the day after tomorrow since we both will be travelling to Birmingham, but you are going to a different town (Sheffield) on the day after tomorrow before going to Birmingham. Will you have time for a short meeting tomorrow? S: I can meet with you tomorrow during the day. G: At what time? S: Just a minute. Let me figure it out. (Note: Subject studies his schedule.) S: The more often we meet the better since we can work out all kinds of details that need clarification. I want to know your views because that is important for me.

100. G: Plan it to be secure because we don't want you to do anything risky. S: I don't want to take any chances either. Even if you give me the assignment to blow up the Moscow Military District headquarters, I must make plans to move my family and whatever junk I own out of the area because I live so close. We must meet tomorrow before the delegation group returns for the evening schedule. I will come here at exactly 1600 hours. G: Very well, and we will not detain you very long since you must get back in time to have dinner with them. I have a little time now yet. We don't want to keep you very long. You have answered a lot of these questions systematically. Let us just finish the few we have left.

101. G: Now with respect to the rockets R-2, and R-11. Are these rockets already issued to your troops outside of the USSR? S: This I don't know. But I know that it is planned to give all kinds of rockets to satellite countries by the end of

1961. G: How long would you say that these rockets have been issued to troops? S: After their final tests at Kapustin Yar and the last modifications were completed, they went into mass production. I would say that the R-2 first went into mass production three years ago and these have been issued to troops since then. The R-11 is more recent. I would say about two years ago, about the time when KHRUSHCHEV first bragged about them to NIXON. G: This is fine. You have answered the other questions on VARENTSOV earlier.

R2
R11

102. S: I would like to ask you if prior to my departure you will have worked out the role WYNNE will play and the various ways I should make contact at receptions in Moscow? G: All this is now being worked on and we certainly will have a completed plan for you before you leave. S: When will we meet in London again? G: We will have this short meeting tomorrow as planned. The day after tomorrow we will all be travelling in different directions. On Thursday, we will be all in Birmingham. We will stay in a hotel near yours and will give you the details tomorrow and we will set the time for a meeting in Birmingham. On Friday we will all be back in London and we will meet there at the Hotel Mount Royal. J: If case for some reason he can't make it tomorrow, should we not give him the details on Birmingham? H: That's alright. If he misses tomorrow, I can pass him the information on Birmingham through WYNNE.

103. S: Mr. Harold, what is the status of my request to formally meet a government representative? I want to present myself officially. It doesn't have to be a specific lord, and I don't expect to meet the Queen. G: Be assured. This is being taken care of.

104. S: Also, I will need some more money. The fifty pounds you gave me is not sufficient. I haven't spent them yet, but I know I will need more since I have many things that I must purchase. G: Do you need the money right now, or do you need it tomorrow, or do you want to wait until you return to London? S: It can wait until I get to London. I have already noted quite a few items there that my wife asked me to get. I want you to realize that all of these items I plan to purchase are perfectly logical for me to have. In fact, they can be obtained through our commission stores in Moscow, but at a very high price. In my status it is entirely proper and normal for me to have certain things, in fact, on a representational basis it is mandatory. Even when I returned from Turkey I had a large suitcase full of things. Nothing was said at all, and there was no customs check. Now I am returning officially with the Committee and there will be no trouble at all. (Note:

[redacted]

listed a long itemized group of purchase requests. In [illegible] had a small notebook full of them including outlines of [illegible]sizes of his wife and daughter.) G: Do you plan to buy [illegible]thing here? S: Yes, I can go out with WYNNE. They have [illegible] things here and they are much cheaper. G: How much do you [illegible]ed now? S: Do you have fifty pounds with you? (Note: H. [illegible]assed Subject fifty pounds.) S: Please decide this question regarding WYNNE, and think of the other requests I have made.

105. S: Are you considering my DACHA? G: We are considering all your requests but whether it's purposeful for you to have a DACHA now or not is not so evident. S: I would like to know what value is being placed on the material that I have submitted. Each one should have what one earns. You told me that you have established a monthly salary for me for which I am very grateful. If you had set it at half that figure, I would not have complained. I am not a tradesman, to bargain. Everyone must try to attain something. I am sure that you are in the same situation.

106. S: I am thinking that everyone may have a black day. For example, I was thinking of this when I was ill yesterday. It could even happen that I could have died, and in the future I may perish in some way. In such a case I request that my wife and mother be approached, but in only one way since they have no inkling of what I am doing nor have I established any plans through any border for their defection. Simply say that I have withheld one fact from them. Say that prior to the death of my father, he had set up either a trust fund or left valuables in a foreign bank and since I am no longer among the living this sum of money is available for my wife. At least this way my daughter may have some subsidy until she is grown up. H: We will do this. S: My wife is totally unwitting of what I am doing and she has been brought up under comfortable circumstances as the daughter of a general. However, she knows what deceit and lies exist in our way of life, and she was very much impressed by Western life when she was in Turkey. She filled out this whole notebook with purchase requests.

107. S: By the way, please prepare everything as if I am to leave on the second of May. I have not yet received the authorization for extending our trip so we must play safe. I will know the answer as soon as we return to London. I request a Minox and I want you to plan on possible radio contact. G: We have planned all this and we will have a specialist there who not only will train you in using the Minox but will even check the actual frames that you take. S: To be honest with you, the last time I used a Minox was when I was in Turkey and that was five years ago so I don't feel sure of myself.

[redacted]

108. S: We must work out plans on how to maintain contact in case WYNNE does not receive a visa to go to Moscow. Then there may be a possibility that I may be dismissed from the Committee. This is not likely, but it must be considered as a possibility. Then, what do we have? We have this good-looking lady with the children walking through the park. We already have agreed on the use of the telephone. G: All this will be prepared and worked out with you in London. We will not wait til the last day, either. S: I hope so much that they extend my leave until the sixth, since it is an advantage to stay longer in London and have more meetings together to work things out. In the meanwhile when WYNNE arrives you can either send anything with him or not, as you see fit -- I mean a message.

109. S: I have already prepared material at home to give to him which includes the details of the whole agent net which I once ran. But I ask you please not to take action against them because it will reflect against me at once, particularly this corporal in Ceylon. G: To hell with him! Don't you realize that we would not risk your security for something that is relatively worthless like that? We will touch no one. S: However, he should be made ineffective. Maybe you could have him transferred to some other place under some legendary pretext, possibly as if there is a threat to his wife or children. G: We are not going to fool with this and invite any risk to you. S: Of course if he fails to appear at a scheduled meeting with our case officers, they may think that something is wrong.

110. S: Write this down, Colonel GRECHKO, with cover as an engineer, is the REZIDENT in Ceylon. He was formerly in the GRU Personnel Directorate and somehow he wormed his way into this job. He is a complete fool. He does not know English. I don't know the name of the second case officer who is there now, but he is the one who replaced ALEKSANDROV, the former case officer. He had been the Second Secretary in Ceylon, but now he is working in the Fourth Directorate in the Direction of Ceylon working group for officers where he is an ordinary officer. If this corporal did not show up as scheduled, or a threat to him were detected, SEROV would demand that the agent's personal file be examined. My name would show up at once as having been a former directing case officer at headquarters. G: Stop worrying. We are not going to get you into trouble. S: You see, I want to help you, and at the same time I am afraid of this. For example, if the whole agent net in India were surfaced, it would alienate our government's relations with NEHRU. But give me a chance to get out of the country before this is done and I will show you how to do it. G: After you are in a secure position abroad, then we may consider doing something and we will do this with your advice.

111. S: I have thought a great deal about our illegal REZIDENTURA which is located in New York. In my opinion, I believe this REZIDENTURA is composed of our GRU illegals. They were brought in there after a STAZHIROVKA in a third country. Judge for yourself and see if I am not right. For example, why do you think SUDIN is now being sent to Turkey as a counsellor? He is being prepared to go now. We have not yet cracked the Turkish nut. Our agent operations there were not effective. He, specifically, is being sent there since he had always worked on illegals operations. (Note: In fact he was a NAPRAVLENIYE chief in the Illegals Directorate.) He is to create a REZIDENTURA there composed of illegals from third countries. I am positive of this. I know that those case officers who followed me to Turkey were not able to accomplish anything.

112. G: How many illegal REZIDENTURAs did you say there were in New York? S: I said only that there was one in New York, that is, an illegal REZIDENTURA, and there is an additional REZIDENTURA which is legal since the case officers therein use the UN positions for cover. G: Do you know the GRU people who are in the UN? S: I can find this out very easily, but I don't know offhand.

113 G: Do you know a Dmitriy POLYAKOV? S: No, but I know a Denis POLYAKOV. He was in the USA twice and he has taken over delegations, just like I am doing now, for the GNTK. He was also the interpreter, but in my case I was afraid that they (the British) might not give me a visa. H: If we hadn't known who he was, he might not have had a visa. S: I realize that you probably had something to do with this since you wanted me to come. Our people at GRU were pleased because they assumed that you did not suspect I was an intelligence officer. Why did you give SHAPOVALOV a visa when you know he is an intelligence officer? H: That is a big question. S: I understand. It is none of my business to know. I don't even want to know. My people at GRU thought that if SHAPOVALOV got through with a visa, maybe I would also.

114 S: Then I could fulfill GRU missions while heading this delegation. Therefore, I request you do all you can to help me fulfill the missions which I explained to you. I will write up an effective report. What I need from you is help in introducing an English acquaintance to the local case officer here in London. All that has to be done is to maintain some contact and possibly your man would pass some sort of material once in a while. The material can be worthless, and it would be good if your man would accept money once in a while. There is no need for the man to accept recruitment. All he has to do is to string the case officer along until such time as I defect. This

is how I visualize it. If necessary the man could be recruited, but he has to work properly. Otherwise it would be traced back to me as my man, and if they smelled provocation, they would put me away so you would never see me again.

115. G: Now, all of the problems you have raised in all operational plans are now being worked on and as soon as we return to London, we will accomplish everything. S: I understand this perfectly. I realize that you have more experience and scientific approaches and better heads than I have, even though I have been in intelligence since 1953 except for a short interlude thanks to being contaminated by RUBENKO. (Getting up to leave) It would be well if you could get WYNNE in contact with me for a couple of months. He doesn't need to be trained or told anything. He can be unwitting, but of course he knows who you are and that I am in contact with you. H: We will take care of all that. S: WYNNE may not be the sharpest man or the wealthiest, but he treats me very well and with respect and I would say that he is a good patriot and an honest man. G: Take your key. S: I wish I could have all of you in Moscow for a month. G: I will take you down out of the hotel and walk you to the corner. (Subject left at 0020 hours on 25 April 1961.)

(14)

[redacted]

Meeting Number 6 (Leeds), 25 April 1961

1. Subject arrived at 1615 hours on 25 April 1961 to the Hotel Metropole in Leeds. Opening Greetings. S: Today representatives from the Ministry of Overseas Trade (Board of Trade) came. They asked what we were going to buy and said that we must buy more -- it was all about buying. What could I tell them? -- "It's terrible." (in English). G: You must be back by 7 o'clock; you can leave here at 6:45. S: I have one request; at the moment we are very well arranged in our hotel -- very compact. I have the funds and it is my job to look after their morale and so forth, but perhaps someone may be checking on what I am doing. I am not at all afraid of this. I say this soberly and definitely. As far as they can guess about anything, I am not a specialist or engineer. As I said, let them try and guess why I am here. This is good because I have been given a task and if they say to me, when I get back, "We were watching you and you were wandering about.." I could say, "Who will fulfill (the allotted task)? I was walking around, studying the environment, taking a good look at everything." That is good. Now I want to ask you to help me. (He explains how he would like rooms to be allotted in the hotel on the return of the delegation to London. The whole delegation is to be on the 5th floor, but not together. His room, as before, was to be on the staircase leading down to the room used for meetings. The "professor" (KAZANTSEV) was also to have his former room. The rest of the delegation were to be on the other side of the 5th floor, together, but all on the same floor.) S: You see this would remove any grounds for members of the delegation to report later about any unusual room assignments. G: Very well, we shall see what we can do.

2. S: I have another small question. WYNNE wants to take his wife with him to Moscow in May. She is absolutely unnecessary. It would be an unnecessary waste of money and she will just interfere. I request that she be left in London. G: Very well.

3. S: With respect to the main military objectives in Moscow which should be destroyed, you can logically ask me why I did not include the rocket Academy since rocket warfare is so vital. I do mean to include it and will describe how this can be done. (The blown-up map of the center of Moscow was shown to Subject. He was asked to mark every main objective on the map.) G: You sketch in the buildings and describe them and I will number them on the map and take notes at the same time in reference to the numbers. (Subject went on to locate on a map the objectives in Moscow, which he suggests should be destroyed with small nuclear sabotage weapons. All these points are marked in red and named on the map accompanying these transcripts.)

D. Read Moscow map.

APPROVED FOR RELEASE
31 MAR 1992

[redacted]

#6

4. (Among subjects touched upon during this discussion were the following. See Map and accompanying identification list.)

5. S: The commanders of the Moscow military district, beginning with BUDENNY, were as follows: BUDENNY, TULENEV -- who now works in the General Staff; after him, ARTEMIEV -- who was replaced by a marshal who commanded in the Murmansk area; MERETSKOV -- after MERETSKOV was removed again came in ARTEMIEV. He was commander of the MVO twice. During the war ARTEMIEV was with the NKGB; his forenames are Pavel Artemievich. At the time of BERIA's execution, ARTEMIEV, who was a friend of BERIAs, was in command of the CHEKOON Division (special duties). Then came MOSKALENKO and then KHYLOV came after NEDELIN was killed and MOSKALENKO replaced NEDELIN.

6. S: Opposite the Frunze Street entrance to the General Staff is the department of Foreign Affairs, headed by Major General SOKOLOV -- an intelligence officer, who is both head of the department and a member of the General Staff. When I was studying at the Academy, he was the director of one of the courses -- not of mine, which was headed by Major General KHLEBOV -- now retired but still alive.

7. S: Off ANTIPIEVSKIY PEREULOK is a garage where Colonel AVRAMENKO sits. A large building there is the Hq of the Ground Forces. It has wide curved staircases. He is the head of the motorpool of the HQ of the Second Directorate and is in charge of the operational vehicles used by the Directorate. Recently, KHRUSHCHEV has taken away the big official cars and replaced them by CHAIKAS, which are regarded as more up-to-date and better than the ZISs which they had. However, SEROV, who lost his ZIS, only got a ZIM in return. BATURIN is still a Lt. Col. in the Supply section and is the deputy to Col. CHISTOV, who is the chief. He issued me civilian clothing, 2 suits and an overcoat. We get new issues every five years. Those who are sent abroad are issued civilian clothing but since I work with foreigners in Moscow, I was also entitled to civilian clothing issue. SHELIGANOV is in charge of the 1st OTDEL which is Radio Intelligence and your friend RYABOV, is also there in charge of radio agent training and radio development.

8. (Discussing the headquarters of GAU commanded by Colonel General ZHDANOV) S: There are discussions on the transfer of VAHENTSOV's outfit (KHOZYAISTVO) -- uniting it with GAU. In general, VAHENTSOV has wanted for a long time to have the commander of GAU completely under his subordination. As I reported to you, the commander of GAU at present works for both VARENTSOV and MOSKALENKO. G: What is VAHENTSOV's title? Is he a marshal?

S: No, he is a Marshal of Artillery (Marshal of the Soviet Union is quite different, of course). (Comment: Marshal VARENTSOV was promoted to Chief MARSHALL of ARTILLERY in May 1961 according to announcement in PRAVDA.) He commands the Rocket Forces of the Ground Forces. (KOMANDUYUShChIY RAKETNYMI VOYSKAMI SUKhOPUTNYKh VOYSK) That is his function. Previously he was Commander of the Artillery of the Land Forces, which comprised both conventional artillery and the rocket units. It was notlong ago - in fact about 3 months - that he received this new title. Although he has been waiting a long time - (He says, "I have earned it" - We know that he has earned it) - they do not give him the rank of Chief Marshal of Artillery.

9. G: And what about MOSKALENKO? S: He is Commander of the Rocket Forces of the land -- everything -- all the strategic rockets with atomic, hydrogen weapons. He commands all this destructive power -- the aviation and fleet are also included. The Black Sea fleet is also divided in its subordination. G: So VARENTSOV is subordinate to the overall commander of ground forces? S: Yes. GRECHKO used to command the ground forces. Now he is a minister. VARENTSOV got on badly with GRECHKO and still does; GRECHKO is not intelligent; he was young for command -- he is the youngest of them all.

10. S: The intelligent marshal ending in ...SKIY, who commanded the Polish Army-ROKOSSOVSKIY, has gone too, for health reasons. (I think I reported this). But I tell you openly it was not for health reasons that KONEV, TIMOShENKO or ROKOSSOVSKIY have gone but because of their disagreement with new military doctrines which KHRUSHCHEV is propounding and forcing on the other marshals.

11. S: They are cowards -- those who agree with KHRUSHCHEV and say "Yes - you are right, Nikolai Sergeich." This "rocketization" -- true, it is a threat, in its own right and -- he could shower you with rockets -- very easily but nevertheless war is decided by the united effort of all military forces and categories. This is a firmly established military war; offensive operations, occupation and then mopping up, etc. What are rockets by themselves? You could smash up almost everything -- then what?

12. G: The officer commanding GAU now is Marshal ZHDANOV? S: Not a Marshal -- Colonel General. He dreams of being a marshal, but they have not promoted him just yet. Earlier, the former commander was Marshal of Artillery YaKOVLEV, whom STALIN jailed because he said that there was no

adequate anti-aircraft armament...Actually they did have AA artillery, but the recoil springs would constantly break and the barrels would overheat. Now they've covered the barrel with a water jacket to cool the barrel. This VARENTSOV told me. G: What is the relation between GAU and VARENTSOV? S: GAU works for both VARENTSOV and MOSKALENKO. GAU comes under the Minister of Defense. But VARENTSOV wants to subordinate it to himself. In that case, they say that it will be necessary to set up an independent GAU for MOSKALENKO. It is necessary to set up technical supply departments including one for electronic equipment. ZHDANOV already has a directorate dealing with electronics and one for explosives -- for all the complexes of which the artillery components consists -- all the seperate parts. The factories producing this are all civilian, not military, but they are subordinate to ZHDANOV since they work for ZHDANOV. The factories in the Urals which produce tanks are under the command of the tank forces, Marshal ROTMISTROV. They deliver when they receive orders -- say for 200 tanks.

(13) S: He (ZHDANOV) is a Colonel General, an ill man. Not long ago he was ill with cancer. After having recovered, he resumed working. VARENTSOV was glad. ZHDANOV gets on badly with VARENTSOV. ZHDANOV used to cater to MEDELIN -- to the higher command -- and he wants to produce armaments for VARENTSOV according to plan only to deliver them and that is all. There is a struggle. Each commander realises that he needs as much technical equipment as possible and that there is no money forthcoming for this. So they swear at each other and the matter goes to the highest military council headed by the Commander In Chief, Nikita Sergeich.

(14) S: MIKOYAN was there and VARENTSOV told me how the meeting went. He said "Oleg, not a word about this". I'll tell you one interesting detail. At the last meeting which took place after the convocation of the plenum of the PRESIDIUM they talked about everyone's troubles with agriculture. After this, KHRUSHCHEV traveled all over the country dealing with his opponents at the conference in accordance with the decisions of the Plenum. He arrived in Tbilisi, you remember, and then went to the East, to the virgin lands -- talking about the great new territories and towns. All that time the military council were working on their plan -- SUSLOV and MIKOYAN participated. The Ministers made reports. KIRICHOV made his reporting on the questions of how they need more money and how rockets must be tested. There were numerous cases where the missions were not fulfilled; much new testing was necessary, and the problems must be looked into. VARENTSOV said, "Do you know that there was no one there who would support this! STALIN would just have banged on the table and that would have been that." You ought to give me small recorder

so that I can tape what Sergey Sergeich tells me. You should think about this. We have such a small machine; it works on wire, not tape. I can talk to him at the DACHA or anywhere -- ask questions of him. He talks to me about all sorts of things - about sessions, conferences.

15. S: When the heads of the Central Committees of the satellite countries came to Moscow with their Commanders in Chief, for instance -- after the political talks -- people left -- the Commanders stayed on and conducted military exercises. There were offensive and defensive problems and we always won. They ran extensive exercises using many brigades. There were calculations using TNT equivalents (atomic) against targets which are known to us. In fact, the game was not abstract. It went on a long time. The commanders stayed for about a week in Moscow. Details were not published. What was in the papers was the arrival of the Secretary of some Party or of such and such a member of a government, for example, ZHIVKO and his commander, Georgiy DESH.

16. (Subject went on to discuss the map of Moscow further.) G: (Discussing Naval Forces HQ). S: Speaking of the Navy -- it is a good thing that you prompted me. I have remembered the Captain 1st rank with whom I was on holiday 2 years ago in SUKHUMI. I have his address in my notebook. He told me that the dock where the submarines assemble is north of Leningrad. I'll give you his address. He was with his wife, and so was I. We got to know each other. We lived in the House of Rest -- the former naval sanitarium. There is a central sanitarium in SUKHUMI, but this is a separate building in the town by the railway station.

17. S: Well then, I will measure every objective by pacing it and I promise to do this by the time WYNNE arrives. I consider this my first task. I'll give you not only the list of Soviet agents which I have but also the First Secretary of the Afghan Embassy in Moscow. I do not remember his name; he is already recruited and is working in Moscow. Incidentally, many diplomats from these countries have been recruited -- "the black skinned countries" as they are called. How did I discover this? I agree that our Counterintelligence works well and strongly against the representatives of America andEngland, but nevertheless there are weak spots and one can deceive them.

18.S:One must work carefully. Yesterday I did not finish answering one of your questions. How did I come to work with the English delegation? Well, after they sent for me on 5 January, I hung around for 2 months in the

[redacted]

#6

reserves. I did nothing but live and wait. I told myself, "Oleg, anticipation of pleasure is also pleasure!" Well, this is the pleasure I was waiting for. So on 29 February -- it was leap year -- an order came out that they had nevertheless decided to put me in a senior position on the operational directorate and they gave me India, Ceylon and Pakistan. I began to work in this Direction in the 4th Directorate. They put me in charge of military study training, since I had commanded a regiment. There were few others who had and I had been at the Frunze Academy. So in the 4th Directorate, I was always in charge of military training (Commander's Days). I conducted seminars and ran examinations on new field service regulations.

19. S: Then one day ZASORIN summoned me with other senior officers and said, "General ZOTOV is going to give you a lecture on operational training -- on communication with agents, theories, ideas, and new practices. Give (Subject's name) a notebook and he can make notes". I was given a notebook by a Lt. Col. of tank forces, a Hero of the Soviet Union who has just gone to Iran as assistant military attache. I will remember his name in a moment. He was working on Iran. We took notes on the lecture from actual cases. In lectures like this, they do not mention agents by name, but only general cases, without connecting them with a town. Although one knows which country they are talking about. Nor do they mention the operational personnel connected with the case. They mention the essential facts only as an illustration. I leafed through the notebook and found a letter written out for a typist -- some times we give a typist a letter to type, say to the KUB, and tell her "Leave out the mention of Mr. Richardson". So we put a line for Richardson. The typist writes out the remainder of the letter and sends it out as SECRET. Richardson's name goes by another non-operational channel so that he is not associated with the AGENTURA. A typewritten statement on agent operations mentioned "the 1st secretary of the Afghan Embassy in the USSR, etc.". A name which I do not remember had been written lighter in pencil -- it was abbreviated. I could not make it out. In other words, the 1st secretary on the diplomatic list is a paid Soviet spy, carrying out orders.

20. S: In addition, the 1st or 2nd secretary of the Egyptian Embassy in Moscow, about six years ago, was a Soviet agent -- that is what I heard. This man in the Afghan Embassy you can spot at once from the Diplomatic List. He is the 1st Secretary. G: And the Austrian Ambassador -- BISCHOF -- is he an agent of yours? S: I've heard his name -- he's in Moscow now. G: Yes,

[redacted]

[redacted]

#6

he's been there about 10 years as far as I can remember. S: I remember the name but I do not know if he is an agent. Anyway, in the notebook which came into my hands, the last page, which was to be typed, had this information on it.

21. S: Now with respect to the agent net (India, Ceylon, Pakistan) I'll give you everything. It's all typed out. Everything is there and clear, with initials and how long each agent has been working.

22. S: One Turk, ACHMED, had a Kurdish father whose mother was Turkish. He conceals the fact that his father was a Kurd and pretends that he is a pure Turk. He was a representative of the Turkish MID (Ministry of External Affairs) in Afghanistan and our people there recruited him. Judging from the information which he produced, he didn't give us much of value and he is not of great significance as an agent. Then he was moved from Afghanistan to Turkey and he is now in either Syria or Egypt. I've got it written down. He is used a lot by the Turkish MID for work in one country or another. Wherever he is he has contact with our people. They know who he is and wherever he goes and he works for Soviet intelligence.

23. S: Now then, once again I am worried -- the most dangerous place for us is in Ceylon. It's a pity that such a [redacted] exists there. How can things be arranged so that he is not alarmed? He has children. G: He will be left alone until you are in a safe place.

Map
Def Min
DMs

24. G: Give me the map. I have one small question. Where are the First and Third Directorates of the Ministry of Defense? The first is the most important because it is operations. S: You must not talk of the Ministry of Defense like that. There's no such thing as a First Directorate. The Ministry of Defense has main Directorates (GLAVNIE). There is a main Medical Directorate which is under the Minister and not under the General Staff, and a main Directorate of Services (TYL) also under the Minister, but there is no 1st Directorate in the Ministry. The First Directorate of the General Staff is the Operational Directorate. The Minister has a number of chief Directorates under him -- what has he? In the General Staff, there is a First Directorate. G: Then the First Directorate of the General Staff is there next door to you? S: Yes, we are all in the same "box" -- different buildings connected by entrances and walls.

diffs

25. (General discussion of map) S: The General Staff is concentrated here -- with everything in the same complex but separate -- the Supply Directorate, Medical Services, etc. All these are subordinate to the

[redacted]

General Staff. However, everything is not planned down to the last detail. The Main Medical Directorate plans how many hospitals would be needed in the event of war -- first, second or third categories -- and how many schools according to the organizational-mobilization plan would be turned into hospitals. Accordingly, I would say that the Organizational-Mobilization Chief Directorate is the heart of plans for every arm of service -- manpower, supplies, etc.

26. J: Will you trace the route you take going to work from your home? S: One interesting detail -- for some reason, after I had made contact with your students, English and American cars very often drove up and down Gorkiy Embankment. Perhaps this was not connected with me because they could not find out my address. My address -- which I gave you -- can only be obtained officially when I go abroad. My address -- if taken out of the passport list (PASPORT MOYEI PIS'MO) -- they would say, "He used to live here, but I don't know where he's gone to now". All this goes into a card index. A KGB colonel is in charge of the process. This is "PASPORTNYATsKYa".

27. S: I often saw high quality cars with the letter "D" going in front of my house and around the area. I enjoyed it. I thought to myself "Soon we shall be seeing each other." J: What were the numbers of these cars? S: I don't know. I didn't write them down. They went very quickly. I knew the cars and maybe they wanted to say "wait". But that is by the way. (Subject describes his daily route from house to work) S: Here is OSIPENKO Street. Here is a large 8 story gray building at the end of the alley I take, which belongs to the Ministry of the River Fleet and where the Minister SHASHKOV lives.

28. S: This is where I walked with our friends. From the power station -- opposite the academy where the FLAKhIN factory is. This alley -- here is the main entrance. We went in here and I went on ahead because the courtyard is illuminated. Here stood a woman and a policeman and here I turned around and, even though I am an intelligence officer, I didn't say farewell properly. J: And then you said, "So long?" S: No, I said, "Let's go". When we shook hands after we got there, the tall one with an umbrella said, "We will hand everything over". Then he asked me, "Are you a Party member?" He found it strange that I was suddenly very friendly. I said, "I used to be". There was no point in explaining and I wanted to reassure him. He said, "We will do something". I thought to myself

[redacted]

#6

"I embrace you mentally". The tall one with the Castro beard said "I will help you; I will do something". I wanted to part from them warmly but I had to go on past the watcher -- to part from them on the GRANITNIY Bridge was difficult. I wanted to say to them "Gentlemen, when you have handed over the material come here with a fountain pen and make an ink mark on the granite as a mark for me." I also wanted to tell them to watch for me in OSIPENKO Street while going to the BALCHUK Hotel, but there was such confusion. It all happened as I have told you. They went off very fast. I watched them go from this side and went after them wondering, "Will they throw my papers away?". I saw two militiamen and they must have seen them. They certainly saw one. Having looked around, one of the students put my letter in his mackintosh pocket. I said, "Control, please, 2 envelopes". (In English). They were good boys. After that, I walked along this embankment and went home. I dragged out the first meeting with them too long. I admit that this was unprofessional of me but; anyway all's well that ends well. (Description of his way to work and of route to dead drop and signal point. In the course of this, Subject mentions that he had thought it might be possible to arrange a meeting in BRYuSSOVSKIY PEREULOK between 9 and 10 PM. The cover story for a diplomat would be connected with the church there, which is in use. An alternative suggestion was the BOGOYaVLENIYE Cathedral in BAUMANSKIY Region near the BAUMANSKIY metro station.)

Pilot story (Riga)

29. S: Now about Riga, the headquarters there -- the Riga Military OKRUG -- a large headquarters -- and about the Baltic Region in general. The Baltic peoples live and wait for liberation. The mood there is bad, but good for us. I would, of course, be sorry if it were necessary to bomb or to annihilate the 3 Baltic Republics. This is a matter for great strategists but this is my point of view. However, the Riga headquarters -- to what is it connected -- perhaps sometime you will send me on a mission to Riga and from Riga perhaps I can come to you -- or perhaps from some other port. Anyhow, all I want to say is that is is not necessary to annihilate the Baltic peoples. That is my own opinion. (In English).

30. S: How did I get into the Committee and how did I come to England? Well, on 29 February, I received my orders to be a senior officer. I accepted the assignment, began to work, and conducted the officer military training program. My work was praised at the Party meetings. I write telegrams and work with agents. Then a reduction in staff personnel began. On the average, they removed the old men; the invalids; those who were unsuitable or politically unreliable. What supported me? I had been aggravated for a long time because of my father -- many knew about him.

[redacted]

[redacted]

#6

My great uncle -- they know about him -- a lieutenant general commanding a Military District. He benefited from the confidence they had in me -- which he needed too to retain his own position. I am married to the daughter of a distinguished political worker, GAPONOVICh, who must therefore have trusted me. I took part three times in the war. I've been a member of the Party for 21 years. I have no Party reprimands. I've twice commanded a regiment and did not surrender my regiment to HITLER. I did not desert and I fought. They wanted to pin me down and were not able to because I could have rebelled against them. They were afraid to take everything into account. Nevertheless, I saw that they were purging people all the time but they left me for about 3 months after that.

31. S: Then I went to the MDA but not as head of a course as promised, but as a senior instructor. As head, my earnings would have been high, as you well know. G: How much? S: Then, it was about 5,000 rubles; now it is 500. And it is a general's position -- I have the experience for such work. I commanded a course at one time and a regiment; it's within my character and ability. I began at first by working in the Mandate Commission and finally began to run the class.

(32) G: So that's where you got your information! S: Of course. At the beginning we selected the class. We processed 150 and took 60. Some were rejected for health reasons because the Special Medical Commission imposes very strict conditions for the MDA. Even though they had been passed by their Military Districts, some tens of people were rejected by us. Either chronic gastritis -- that's no good; or eye-sight defects -- 05 or 06. They do not reveal these requirements to the Military Districts, but they reject them on the spot if there is a precedent for turning down a man and sending him back to his unit. Well, 150 were processed and there were 6 withdrawals. I talked to about 50 of them and assessed each one, clever, well-read, a fool, energetic, experienced, etc. I chatted with them; we discussed everything. Then I wrote reports on them. They are assessed and they take an examination. One can obtain a "2" for foreign languages but if one has a knack and the ability to master the sounds of foreign languages they make a separate entry "has a great facility for foreign languages and in spite of the fact that he now has a 2, he will eventually get a 4 or 5 according to his ability". This is seen by the head of the faculty (KAFEDRA) and the language teacher.

[redacted]

33. S: Incidentally, teachers are very highly paid. At present, a senior civilian teacher gets 3,500 rubles -- a very high sum. This is if he prepares students in languages for intelligence. (SPETsPODGOTOVKA) You remember General LISITSIN who was head of the department dealing with intelligence training? He has been retired now. G: Really. He was an authority. S: Very much so.

34. G: (interrupts) VARTANYaN. S: A lieutenant general. G: Is he still there? S: No, now he is in command of our GRU Institute (technical) near Moscow. G: I thought that was FILIAKh. S: No. At FILIAKh we now have the Operational Archives in the GRU. A colonel is the chief and they also have courses there. Well, VARTANYaN is not there. I know him very well. He was deputy head of the Academy. I know LISITSIN well too.

35. G: Is he a colonel or a general? S: A colonel -- he is an instructor there.

36. S: Well, we took these 60; told them they had passed and sent them on leave. This was 1 September. I felt at ease mentally. My friends came to see me -- GUS'KOV, who was in Turkey, your illegal; SHCHERBAKOV, the lieutenant colonel, the thin one. He asked me" Oleg VLADIMIROVICh, how am I to go out? Should I wear uniform or civilian clothes?" I had a special consultation. They gave him a room in which to change from civilian clothes so that he would not be different from the students -- when he needs to go into a service establishment. Of course, we have days when the whole class of the academy changes into civilian clothes; when they go into the town to clear dead drops, carry out meetings, make recognition contacts, etc. Each student has civilian equipment; a suit, a coat, shoes, etc. -- a civilian outfit. Otherwise, they wear uniform. I took to the work wholeheartedly I love to command; it's not a bad business. KHLOPOV -- your relative -- said "good-bye" to me and said, "Oleg Vladimirovich, you suit me. We will work together". The heads of the courses were all colonels (3 courses) -- the former Military Attache to Yugoslavia, a Colonel; the Military Attache from Afghanistan, Colonel TsAYEV; and (Subject's name). G: And KHLOPOV? S: Head of the Academy - Lieutenant General -- I can't remember his name. Don't swear at me for that. I will feelduty bound to find out for you. I know him very well. I know when his wife died. That was in 1955. I know that he was then married to another woman but that the marriage was not registered. He lives opposite the U.S. Embassy.

[redacted]

#6

37. S: KhLOPOV said to me "Go on leave". So I took my wife and daughter and went to Odessa. Returning from Odessa, I met your people. When I got back with the heads of the courses, we went to the house near SOKOL (the MBA). Well, I was all set to get down to some work. The higher category ranks me above senior officer and the salary is more -- this is because of its duty status. Of course, I had already made up my mind. The material on the rockets was already in my pocket, or rather in a hiding place. They told me that they decided to make me a senior instructor in tactics. I said, "No, I will not work as an instructor. What is this about?" They said, "With your training, with your experience, and with your education on the technical course, you would be very well qualified for a job as an instructor." I said, "When I am 60 or 60 years old, I will work as an instructor. Now if I had given you my agreement prior to my leave or if there had been any questions, everything would have been settled." But they -- without me -- they wrote an order appointing me as an instructor. I had the order number and everything, but I did not go. Major General SALODOVNIKOV -- he is at present head of the faculty of tactics -- met me on the street near the barracks and said, "Why have you not come to me?" I said that he had not talked to me and said straight out, "I will not work for you."

38. S: I was sent to SHUSKIY. He said, "What's all this about?" and he sent me to SMOLIKOV. SMOLIKOV likes to drink and he always has women about. He is friendly with another General who was a former director of a hospital -- who also had women around. They kicked him out for that. He has all sorts of furniture in his flat -- several pictures and a refrigerator. The refrigerator was given to him by SHTEMENKO. You should hear more of these things - what a spider's nest that is. It shows how everyone is caught up in this sort of thing. A high moral standard is demanded of everyone. People are persecuted, beaten, thrown out of the Party -- but this is how the SVOLOCHI themselves carry on. This crook was given a refrigerator by SHTEMENKO when they were playing cards in the General Staff. SHTEMENKO said, "I'll give you this refrigerator". The other thought that he would have to pay something for it, but there was no need. It was forgotten. KRUCHIVSKIY is a friend of SMOLIKOV. They share women and there is a flat. G: What does KRUCHIVSKIY do? S: He is the head of a course for medical nurses not far from the Committee. He receives three thousand rubles and a thousand rubles for each course, and he hides what he gets from the courses and drinks it up with girls. He lives on a Pension. He has a flat on Gorkiy Street, near the ByeloRussian Station. SMOLIKOV said to me, "How long have you served?" My knees were knocking. I said, "In 1962, it will be 25 years".

[redacted]

[redacted]

#6

Then came the question of my father and of the supplement. (Subject's statement about his father). He told me that was the reason I was not sent abroad but he still kept me. Now the Central Committee of the CPSU has a character sketch of me and the proposal for the trip to England put up by the Committee, as if I were a demobilized Colonel. And in addition, the GRU, the military section, informed the Committee of my good candidature and of my characteristics - there is nothing against me except my father. But of course this hinderedthem (GRU) from letting me get ahead. "It is awkward"... he told me "How could a man with such a past be an instructor of 60 future Intelligence Officers. It may mean nothing to me but the Central Committee is interested and checks on it. It is impossible to confirm you". When I was in Odessa -- in Kiev -- on leave, they changed my assignment to an instructor -- that would be acceptable. I would give lectures and instructions in methods of work. That is something, you know, for a man who is inactive in the sense of administrative obligations to superiors and to the Party. Perhaps they considered that they were showing me trust in that I was working as an instructor, but I refused categorically to work with them. It is no life, you understand. I decided to defect. Three times to risk one's life; to be in the Party for 21 years -- I don't know what I have not done for the country. Well, they put me back in the Reserve again and I began to look for operational work - "Give me some work in Pakistan or India". I showed them I could manage this. "We can't do it". In other words, they did not wantto have on the operational staff anyone with the slightest thing against him.

39. S: I went to see Colonel ROGOV - he is the head of this section of 58. A sort of large reserve, but an active reserve. The people there work and do small jobs and are taken out and sent off on missions. He went off and consulted SMOLIKOV who gave his agreement, otherwise, I would have to resign. I would not work on what they suggested. I would not go to Information. I don't like writing; I have neither the ability nor the desire.

40. S: And on the 15th of November -- I have the order at home -- I was appointed as an expert to the Department of Foreign Affairs - the (GKNIR) ✓ Committee, ~~the GKNIR~~. I joined the Canadian Section only. Within a month they added Australia. That is to say, I dealt with both Canada and Australia.

[redacted]

[redacted]

#6

41. S: And now write this down. You must check this although you love and honor me as I do you. One BERDENNIKOV went to America with a delegation of railway men in December 1960. He actually left on November 25, and took ten days traveling by sea. He left as I arrived. We have one large room - the English, and the American Sections. On the American desk is POLYaKOV - Denis Nikolaevich - one of our people with whom I studied in the MIM and we graduated together in 1953. He is married and was in India as a First Secretary. Prior to that he graduated from the Dzerzhinskiy Academy. He is an Artillery Lieutenant Colonel. He finished the Command faculty (KOMANDNIY Fakultet).

42. S: The Dzerzhinskiy Academy was split up, as I told you, 6 years ago. I arrived - there was a group of 5 of us from Strategic Intelligence - five out of the 58 in the GRUK. There are others in other Ministries which have departments of Foreign Affairs -- the Ministry of Culture, the Ministry of Transport, etc. I, POLYaKOV, ANDRIANOV - he was in Austria and must be in your card index. Viktor Nikolaevich, a Lieutenant Colonel, a Tank Engineer, who finished at the Stalin Academy (This is the Academy next to the Lefortovo Hospital where the head is KRUGHIVSKIY whom I told you about.) ...

43. G: Which of your Directorates is he from? S: He came from the Austrian Section. He knows German. Then there is FOMAKOVSKIY, who is now in Italy. Vadim Vadimovich. I came to England at the same time as he went to Italy with a delegation. He is a Captain Third Rank. G: Is he in Italy now? S: Yes. Or he may have just now gone back.

44. G: And BERDENNIKOV? S: He is an old worker of the Committee; the head of the English Section. POLYaKOV is head of the American Section; he has worked there for three years. Before that he was in Delhi. His wife, who is a beautiful woman, went to live with our trade representative in Delhi. As soon as they heard of this they withdrew POLYaKOV and his wife from Delhi within 24 hours and he landed up in the Committee -- three years ago. BERDENNIKOV went to America with a delegation of railway men at the end of November. He went for twenty days. He arrived in December.

45. S: His assistant stayed behind -- he is Igor MILOVIDOV, who is in your photographs. He went straight to the Committee when he got back from England. They said to me "(Subject's own name), WYNNE's delegation is coming".

[redacted]

WYNNE had already been before, but he had not been to the Committee. I read reports and conversations about him by BERDENNIKOV and ALTUKhOV - WYNNE knows him, he is an engineer in the office. G: Is he one of yours? S: No. He is in the GNIK of the RFSSR. We have a Committee in each Republic. They said to me, "You will work with this delegation". I let all the Canadian business drop because I had to prepare all the lectures and to get together a panel of experts for each lecture -- engineers of this and that -- and send telephone messages, to summon specialists and others to attend the lectures of the English specialists. KILESOV, from Alma Ata, was there when Richards gave his lecture.

(46) S: I met WYNNE at Sheremetevo. I worked very well with the English delegation. All the lectures were organized, receptions. The specialists gave nothing but good written reports and the delegation was also pleased as you know. G: Was SHEREMETEV there? You mentioned him. S: I never mentioned SHEREMETEV - FORMAKOVSKIY, BERDENNIKOV and Igor MILOVIDOV who was in England. G: Is he on the English desk? S: Yes. And so is BERDENNIKOV who came along and said, "It's very good that (Subject's own name) has helped us". The deputy was swamped. From England there are very many delegations. Not so many come from you as go from us. I was brought in to help because BERDENNIKOV was not there. I worked from beginning to end with WYNNE's delegation and then took them out to the Airport.

(47) S: When we were there, on the 16th of December, I had the idea of suddenly handing over my materials to [redacted] in the aircraft and saying, "Here you are". It could have been done somewhere - in the toilet for instance - but he would just have repeated once again, "My business is cement". (In English)

48. G: Is MILOVIDOV one of your Intelligence officers? S: No. He was a straightforward worker who was coopted by the "neighbors" (KGB). He is not an Intelligence Officer and he is not ours. We wanted to take him on but .. there was already a case for his cooption. G: ANDRIYANOV, I know is one of yours. S: May I finish?

49. G: I should just like to recapitulate. FORMAKOVSKIY is yours too. S: Yes. Then POLYaKOV and (Subject's own name). G: You said that there were 5 people. S: Yes. There is a Captain... G: Not BERDENNIKOV then?

[redacted]

#6

S: No. He was coopted by the "neighbors". They have two categories -- those who work against foreigners and who watch us while we are abroad, and the local internal "domestic" (English) lot who look out for counter-revolutionaries, if there are such people, for a Fifth Column.

50. S: The Captain... G: ALTUKHOV? S: No. He is in the GNIK of the RSFSR, in a different building altogether. G: Not an Intelligence officer? S: No, I don't think so. He was invited by BERDENNIKOV, when WYNNE came, to draw up a program showing how many specialists there are in the Federation, and so forth. We coordinate.

51. G: But there is another one. S: Yes, the Captain ... was trained to work as an illegal in Spain. He was ready to go. He knows Spanish "exactly". He was on temporary duty in Spain for a short time with our specialists. I cannot understand how the Spanish let him in. Then I heard he came to the GNIK. Not long ago he was summoned and they said, "You are not suitable for Intelligence work". Now he has gone to the Institute of Foreign Languages. He has an excellent knowledge of Spanish. He did not go to the Academy. He was almost completely ready to go as an illegal to Spain. Captain... I will give you his name in a moment, I did not know him when I arrived. He finished the Academy after me and went straight to BEKRENEV for his training for Spain. Something was wrong - his parents or his relativer - which stopped him from going.

52. S: There is a certain FEDOROV in Turkey who finished at the Academy a year after me and who went to the KGB. He worked for a long time as a Second Secretary, then as a First Secretary in Turkey. His name is FEDOROV, Vadim.

53. G: Have you heard of KOSTYA SHESTAKOV? S: Yes, of course. But I did not know he was called KONSTANTIN. G: Where is he now? What is he doing? Do you know? S: No, but I know the name. G: Is he still an illegal? S: I don't know. I know him as an Intelligence Officer. I am still trying to think of the Captain's name; it is very important. G: It is not a question of your accuracy...I would very much prefer to have you give 5 rather than 4½.

54. S: Well, I accompanied WYNNE's delegation and thus the delegation knew me as a member of the Department of Foreign Relations. We were on close

[redacted]

terms and drove about together, showed each other photographs..We got invitations from firms and began to get ready a delegation ourselves, which was limited at first to one body and then expanded to include theoreticians and so on. Well, that's how I came to work in England, in short.

55. S: This morning I remembered the surname of VARENTSOV's son-in-law, which I could not recall yesterday. He is called Leonid GONCHAROV; I don't remember his patronymic. He is a Captain who is finishing the Command Academy in Leningrad. After he leaves there he very much wants to go to the GDR (East Germany). G: But he was there earlier? S: Yes, he was there before the Academy. He came from Germany and married Yerlenn, had twins, and was sent to Leningrad to study. And he was acquainted with Yerlena when he studied the Tenth Class in Lvov. He is the nephew of Major General KUPIN. G: Was he ever an Intelligence officer? S: No, a Lieutenant. He was never in Intelligence.

56. G: Do you know another GONCHAROV? S: No, I know a Colonel. G: Is that a slip of the tongue? S: No, that is right. I made a mistake earlier. So it is GONCHAROV. I'll remember the name of the Captain and tell you later. I am just sorting out my thoughts.

57. S: One thing which I want to say quite simply -- as one who considers himself already your worker, your Intelligence officer -- I would like to express a few political thoughts. This is all connected with our work. I do not understand why now, so long after World War II, the Soviet Army has not once had to shed blood as HITLER so rightly did in his time through Finland. It would be difficult for the Soviet Army in the Far East. S: I am one of those who believe that from time to time there should be local wars which do not involve our own powerful leading countries. It is necessary to do something to wrench Finland away from the relationship she has with the Soviet Union. It is necessary to bleed them, to suck the Soviet Union dry of materials, using the morale factor, which as you know is unfavorable for them -- such local wars where atomic weapons are not used, only classical artillery and close combat weapons. Then you will see for yourselves the morale level of the soldiers and officers. The war should last 3 or 4 months somewhere, like the one there was in the Far East in the last decade. Blood must be spilt. Somehow the USSR must be weakened materially. It is good that KHRUSHCHEV sticks his neck out. Let him help CASTRO more. Right now CASTRO has almost used up his supplies. Let him give more -- a lot more. Of course, I would not have permitted him to deliver these arms but I am not the President. I am subordinated to the President -- but I am an Intelligence Officer and I have a little experience.

[redacted]

#6

58. S: You must excuse me for passing judgement on such large questions but I feel myself to be free. I am in the Free World. It is necessary somehow to drain the energy and to divert the great material and living strength of the Soviet Union -- not to bring about a great world conflict. I wrote all this down once and I am repeating it. I think it is necessary to have meetings, secretly conducted -- not Summit meetings, which KHRUSHCHEV welcomes. He will use the decisions reached at Summit meetings to increase his own prestige vis-a-vis the U.S. and England. And he uses them to his own advantage. This you understand very well. It is necessary to call together all the leaders of the Free World and to arrange first their coordination; secondly, their unity; and thirdly, the material sacrifices which they must make in the name of common victory.

59. S: If this is not done, there will be a great disaster. KHRUSHCHEV and the General Staff can leave you behind. He is throwing together these rockets and he can do terrible damage with them. But in my estimation and according to powerful people in the leadership, he will need two or three more years. But not longer, gentlemen, not longer, believe me.

60. S: Well, we will meet in Birmingham at the Midland Hotel at 2100 hours, the day after tomorrow. G: Very well. S: How about showing me some more photographs. G: We are getting more ready for you. S: Maybe I should call WYNNE and tell him I will not come. G: You had better not, since this may direct suspicion. This is dangerous. S: I have another 15 minutes or so.

61. S: Well, I have mentioned the First Secretary of the Afghan Embassy. He is an active agent, paid and everything.

62. S: Now, gentlemen, one thing which I wanted to tell you about. You know it but I want to confirm it. Not long ago SUDIN gave us a lecture. G: The same SUDIN? S: The same -- your friend -- about illegals. The Central Committee of the Praesidium passed a resolution pointing out the shortcomings and frequent mishaps of Soviet Strategic Intelligence -- both of the military (GRU) and of the neighbors (KGB) -- of the neighbors, more than the military. G: Excuse me, to whom did he give this lecture? S: To everyone -- the operational people -- not "Information" (English). Every Thursday, I go to Commander's training. G: Who took part? The second, third and fourth Directorates? S: No. According to each Directorate ... our group took part with the Fourth Directorate. Our group is attached sometimes to one Directorate, sometimes to another.

[redacted]

[redacted]

#6

63. S: The lectures are of a general character and are on the sequence of training of an intelligence officer (illegal) -- entry to, and exit from a country for preparatory training (STAZhIROVKA) as phases or periods of training in a third country. What is it composed of, this preliminary work in the Soviet Union? His dispatch to a third country for preparatory training -- the language, legalization with a passport, documentation, final polishing and everything. His training ends with his dispatch to the country to which he is assigned. The lectures are top secret, with concrete examples and theory -- but theory taken from life -- depersonalized theory. He (SUDIN) gave this last lecture. He worked on it and prepared it while he was working for BREZHNEV.

64. S: What I want to say to you now? It is very necessary to sharpen the weapons of the experienced, esteemed, long-established British Intelligence Service and of the young, militant, comparatively young American Service "compared with the English" (in English) and, in general, the intelligence services of the whole world. Everything that can be done must be worked out separately to neutralize the illegals which the Soviet Union is planting; to uncover them and destroy them. This is "the main idea of our future" (in English). G: Yes, we agree completely. S: For this, we are stealing from you. We buy up clean documents and all forms .. for instance, materials for passports, for legalization to settle into organized work.

65. S: That is one question I want to put to you. I know that in England forgery of money is a capital offense. That, as they told us in a lecture, a pound note has in it a metal wire which acts as an indicator to pick out a forged from a genuine pound note. Why can't such a device be used so that when passports are periodically controlled it can be determined whether the passport is also genuine, and whether it has been registered? Why, when you use a large number of people on registration of the population, do you not check the genuineness of passports. (Note: Two days before this meeting, on Sunday, 23 April, there had been a 10-year national census in the United Kingdom). This one job should not be done alone; it should be linked with government work on a national scale with our questions. The regime should impose a CE check. We cannot go wrong -- which is a genuine and which is a false passport. As a rule, passports for illegals are not issued by you but by Soviet Intelligence using all its experience in legalization. Surely, such clever, experienced people under conditions and before the face of the greatest danger, cannot allow Soviet intelligence to rely on illegals -- illegals which are sown throughout countries of interest; illegals who are perhaps recruited nationals of this country or another. It is very difficult to unmask the people who were born, say, in England and who were then sent to set up in an illegal REZIDENTURA.

[redacted]

66. S: This is very difficult, but SUDIN is going to Turkey to take Soviet illegals and nationals of certain other countries and to set up or organize an illegal REZIDENTURA. It also seems that this Soviet REZIDENTURA in New York consists of Soviet intelligence officers who were filtered in from various countries -- merchants, firms, etc. -- that is what I think but I don't know exactly. SUDIN is going to the base where I was (I'm thinking of an intelligence base rather than a military one). Without any Turkish intelligence agents -- there was only FShIVIY about whom I told you, a little lieutenant who was in touch with me through GURIEV. GURIEV is not an experienced intelligence officer; he interpreted for me during the intelligence work in Turkey. I sat with my chauffeur and GURIEV sat behind with this MEKHTEST. He finished school there and gathered data by asking Turkish soldiers, "Where are you going -- to BAKhChISARAY -- to Istanbul -- to BALYK/FALYR?". And then he wrote down "This regiment ... that division ...". This data is fairly accurate because each person knew where he was going and talked about it. Later this lieutenant was moved to Istanbul and he is there now. I don't know, however, what may have happened recently. Perhaps he has been caught (NAKRYT) in connection with MARLAGIN's compromise.

67. S: What do I want to say? How we must sharpen our weapons so that we can think out and devise counter-measures so that we can catch Soviet illegals by our combined efforts and wipe them out. This is a terrible business. Soon, for example, you will receive through the MID (Ministry of Foreign Affairs) an application for a visa for SUDIN. Of course, it is absurd for the Turks to grant it; they might give it to him knowing that he is going as a Counsellor. G: Do you know his Christian name? S: You will get that from me straight away. Incidentally, I am on very good terms with SUDIN. He was sorry to see me go out of the Directorate when I was assigned to the Academy to head the course. He respects me as a worker. He does not know the details about my father. Well, he is getting ready to go to Turkey. In Turkey, there is nothing -- he will use his experience and he is not young. He was head of a Direction under BREZHNEV. And he is to take illegals who will be sent to him from Iran, Afghanistan, perhaps someone from the USSR, from Bulgaria probably (Bulgaria is a very good base for intelligence work against Turkey).

68. S: This you must take into account and think about seriously. (Interruption -- The maid tried to get into the room but the door was locked.) G: You didn't finish describing the lecture on illegals which he gave. S: I will tell you -- The preparation of an intelligence officer for dispatch from the USSR to another country for preparatory training (STAZHIROVKA) and the third stage of preparation of an officer after the preparatory training

for travel to the country in which he is to work. This was interesting and I will concern myself with this. I will photograph the lectures. I will include this activity in my work for you. All the materials there will be "the resources for thinking in the future". (In English). But I ask that I may work on this now because valuable time will go very fast. G: Do you take notes? S: No, I will photograph (the text of) the lectures. They only allow us "listening, questions, answering" (English). They do not allow us to take notes and the material is secret and the questions are top secret. Any notes would be secret -- you listen; ask questions; you are in an Academy. Why should you want to ask questions? Everyone should understand and grasp what is being said. These lectures are in the SPETSFOND. They are prepared in the Academy. When the split-up (RAZBIELENIYE) took place, and they sent a lot of BEKHTEREV's Direction chiefs to run illegals from the Area Directorates, a Lt. Col. KHLEBTSOV, one of the "easterners" (VOSTOCHNIKI) came to us. He was caught red-handed in Iran in 1955. He came straight from BEKHTEREV because his work in Iran was connected with illegals. I do not know if we have an illegal REZIDENTURA in Iran. I cannot speculate and I have no right to do so, but to this day KUPRIYANOV is occupied with illegals.

69. S: What do we have in each country? We have safehouses which are mail drops through which we support illegals. There are already quite a number of illegal REZIDENTURAS. G: Did you ever support illegals in Turkey personally? S: Yes, I filled dead drops for them. G: Do you know who they were? S: There was no personal contact with any of them. G: Was there a professor at the university? S: No. G: A German? S: No. I do not know. G: Were there any women? You could have known whether they were men or women. S: There was one illegal woman agent. G: A Russian? S: That's right, but that was before me. But women... G: Anyone with a shop, anyone like that, a hat shop or a clothes shop? S: No. She had a shop on Ataturk Boulevard, just beyond the Red Cross Building (BALYK FALYR), on the left side when going from the embassy. This is in Ankara. There was a shop there it is still there, of course, which sells silver things, dishes and candlesticks. By the shop is an automatic telephone into which I put 20 Kurush on the 4th of November, and phoned just before my departure. I had my passport and everything. I reported (to Turkish Counterintelligence) that a manual had been stolen from the Turkish exhibition. G: Did your people do this? S: Yes, our people and the Bulgarians. I told you about it. You can check it. Write it down -- with the Turkish Counterintelligence.

70. G: Did you know illegals by either a real or a false name? S: I don't remember a thing, I swear to you -- perhaps Nikolaevich (jokingly). G: Did you ever meet any? S: No. Everything went through a dead drop. I put in money. An operational worker would arrive and say that a letter would arrive through the diplomatic pouch, with an enclosed letter with instructions stating that the letter was to be put in a mail box in Ankara and that the police should not see this being done -- numbered sheets not to be separated or undone. I did this. Also, I cached money in places designated. This was to service BERGEREV's people.

71. G: Was the shop far from the embassy. S: Yes. Going on the left side from our embassy, you go past Red Cross House where there are sculptured figures of doctors and great medical workers. Immediately beyond this on the left is the little shop. I know that there was a Yugoslav there. They said to me, "We have a great interest in this shop. When necessary, this is a reserve -- then we shall use it". G: You know that there was a woman there? S: Yes, some woman -- I never saw her face or knew her name, or anything. I never met her or had any contact with her -- "absolutely". (English). During my 18 months stay, we worked to service them 3 times, loading money. Once.. G: Can you say approximately when you worked with them? S: I'll think about it. I can't remember very well at the moment. I remember one detail. We cached money for a courier (HARSHUTNIK) and they caught him, just at the Turkish frontier. I had been given all the recognition signals -- the color of his eyes, his name, and his forenames -- an Armenian. Through the Bulgarians, I found out -- there was no Bulgarian military attache there then. I don't know whether there is one now or not but the 2nd Secretary was military -- a major. He discovered at the time when he visited the jail - you remember they arrested a Bulgarian in Istanbul who was caught with a clandestine radio set. He had a diplomatic passport and they beat him. Whether they fed him or not, I do not know. They arranged his release. He said later when the Bulgarians contacted him that an Armenian had been brought into the prison and his description tallied with our man who had been caught and who was sent from the RP (Intelligence Unit) on the frontier and on whom I had been given recognition data. Therefore, they do not permit military intelligence officers to have personal contacts and why should they be allowed to? It is necessary to cache money or jewels or a letter and then go off. For anything else, it is none of his business; there is another channel for that. G: It is very good that you have told us this -- it is very interesting.

72. S: The shop I mentioned has all sorts of things -- trays, candlesticks, candelabras, huge dishes. Opposite is a confectioners - the name NADEZHO (phonetic), which sells ice cream. Show me the map of Ankara and I will spot it. G: Do you want him to see some pictures? H: How much time have we got? J: I don't think we're going to have time. S: Maybe I should not go. G: It is better that you go. S:..Because this is very important. H: We can go on for a few minutes.

73. S: I will finish off my thoughts. It is necessary to consider this. As an example take SUDAN, you must remember that ... once again I tell you that the Soviets have an illegal AGENTURA in their hands and KHRUSHCHEV, with the head of the General Staff and with SEROV has already begun to use this even more actively. They tell us that only with the help of diversionary groups and of the illegals can we seriously undermine the potential of the Americans and of the British -- our worst enemies. And their great defensive strength and economic position, etc., can be reported on by legals and illegals. We must consider this; learned men must be collected to consider this. We are faced by the fact that there are and will be illegals and once again I say that -- the military attaches are no longer the REZIDENTS. They considered that it was too easy to spot the REZIDENT, since he would quickly be identified by his official position. This is not hidden. Now, all legal REZIDENTS are under cover. They may be colonels or generals. Somehow passports are adjusted or changed frequently. You mustthink about this.

74. S: By the way, [redacted]EV is sworn at by SEROV. SEROV does not like him, so that you know. At a Party meeting in the First Directorate SEROV just tore him into strips. He said that he was not doing enough, that he should set up a strong illegal network. Why does he need this? It must be organized so that it could find out prior to "H" hour where there was an impending attack, so that we might be the first to act. The English and Americans are "the main task" (English). Therefore, the accent is on illegals to do this. You see, from the position of military or naval attache one can only get hold of journals and newspapers and nonsense--contredictions... These can continue to do this but the operational priority is given to illegals.

75. S: They are training illegals intensively now. G: What happened to your admiral? You remember you had a vice-admiral who was, as it were, a deputy for Strategic Intelligence. He had a special position as a deputy. I don't remember his name -- YeKOVLEV or something beginning with "Ya". What happened to him? Was he just removed? S: There was such an admiral. Yes, yes, he was removed. G: Was the organization somehow..? S: The system

was changed -- SUDIN said in his lecture that we were duplicatingour efforts, though I heard this before SUDIN. We were duplicating -- money and the best cadres were given to the legal REZIDENTURAS. They have the position.

(76) S: You know what a "legal" REZIDENTURA is? Of course, all work is "illegal". A REZIDENTURA is made up of a legal APPARAT with which agents are connected. We gave them the best cadres, money, attention - they have leadership and are directed in every step with operational letters, etc. We saw that this produces nothing -- no achievements, mishaps, etc. Therefore, they took out the intelligence officers and military attaches and switched them over, and now they are replacing them with fools from troops who don't know a letter or a foreign language, not a word. They make an impression alright, they are covered with medals -- to go to receptions. But direction is done from under cover.

77. S: In Iran, for instance -- Iran is a very dangerous spot. The REZIDENT and his deputy Major NIKOL'SKIY should be removed. Iran is the sort of place, you know, which is very dangerous for us. G: Do you know NIKOL'SKIY? S: I have written about him and spoken about him. There are two others -- one, a colonel, was operational deputy in the DDR. S: I don't know him. G: He appears to be in Poland. The other, the small NIKOL'SKIY was some sort of instructor, wasn't he with you in the MGB? S: He recently finished -- The NIKOL'SKIY about whom I wrote and whom I ask you to have thrown out of Iran. He knows another of the Iranian languages -- URDU, or is it the other? G: Farsi? S: Yes, Farsi. Then this effective FILIPPOV, a colonel, who was abroad before; he is the REZIDENT. NIKOL'SKIY helps him with the languages, knows the work well. He is a most learned person, operational, capable and a quiet slender fellow. His wife works as director of the school in our colony in Iran.

78. G: Do you know AMOSOV? S: Ofcourse. G: He was in America, in Poland, and received awards -- for what I don't know. He finished MGB in 1951, together with BERIYEV's men from England -- GUSKOV. You remember him. He also was two years before you. S: I know of GUSKOV but no details about him. I will check up on him and report.

79. S: Various matters are now clearing up. They have taken operational workers away from BERIYEV and given them to the Directorates, but BERIYEV's set-up remains for the special REZIDENTURAs which already exist. They have sent down people like KUZNETSOV, from Iran; and the Pasha, whom I have already

mentioned; a major, whose name I will remember; and SUDIN. They sit and work out how to set up illegal REZIDENTURAs in these three capitalist countries. Thus the task in Turkey is to get an illegal REZIDENTURA going. There is a base there and there are people who are in the USSR. A number can be moved from third countries and SUDIN, as an experienced intelligence officer, is being sent there too. Think about it -- should he be allowed to enter Turkey or not? This is an affair for the Turks -- I cannot decide it. I can only tell you that there are operations being planned there.

(30) S: I think it is time for you to go so you will not be late. Should anything happen to upset our plans in Birmingham so that we fail to meet, remember that immediately upon your return to London, the room at the Mount Royal, No. 360, has been retained for our meeting. S: And please don't forget to arrange rooms for us on the 5th floor, so that we will all be there even though my room should be slightly away from the others. We will meet the day after tomorrowin Birmingham then at 2100 hours. Will you prepare a Minox for me? G: We will not only prepare this but train you in its use before you return. S: I will take only negatives and give you the undeveloped film. I must work in daylight. There are no electric lamps available where the material is. Maybe reflex paper can be used to copy? G: We will cover all this during your training. S: Very well, we will meet at 2100 hours on the day after tomorrow. Subject left after 1900 hours.

[redacted]

(15)

Meeting Number 7, Birmingham, England, 27 April 1961

1. Subject arrived at 2100 hours at the lobby of the Midland Hotel in Birmingham and was taken to the meeting room. After greeting and sitting down - G: We have been thinking about your request to meet an important man. Now, tell us what you yourself have in mind, because to obtain such a person is no problem for us. However, you know yourself that prominent people who give commands do not all understand secrecy as we do. Perhaps nothing will happen and nothing will be said. Of course, such a man would not know anything personally about you, as one might say. But you understand -- it may seem like a small matter but the fewer people who know about you the more secure things are. But we can do it, nevertheless. S: I will try to explain to you and do your best to fulfill my request; I am very glad to confirm that we Intelligence Officers are working for the good of our Free World -- ignoring the fact that we are meeting today for the seventh time or that we have now worked together for 25 hours in all, as I have calculated. This is a long day, during which we have sat and not slept or eaten or gone out anywhere. I feel that we are on the same wave length. I have also prepared an answer for your question. I have expected your question. I am glad that I can think about it again and glad that you so deeply examine and understand me, and that I find myself in such trustworthy hands. This is very pleasant, and it encourages and inspires me.

2. S: I have prepared a small official declaration which I want to pass to you. This will be at the same time a reply to your question. A week has passed in which we have worked directly and in which we have had the good fortune to meet for the solution of great and important matters. I consider that I am not just some sort of agent - no, I am your citizen. I am your soldier -- a soldier in the direct sense and in any other, as you like. I did not come to you to do little things. If I had not had sufficient clandestine capabilities, in spite of my hatred and contempt for corrupted Leninism, perhaps I, as an Intelligence Officer and as one with a higher education, would not have dared to presume to grasp at such questions, or come with such requests and such definite demands -- believe me. I consider that I have such unusual and special capabilities and accessibilities for agent work, that I shall be able to prove this by helping my Queen and my President - as a line soldier. You must understand me correctly -- I have talked about this several times -- I am capable of great things. I want to prove this "as soon as possible". (English)

APPROVED FOR RELEASE
31 MAR 1992

[redacted]

(3.) S: Now I enter with you on the second half of my stay in Great Britain. For as long as I am here you will accompany me and finally, to my regret, I will part from you. I ask you once again to hear me out and to try to understand me and to arrange this for the good of our mutual cause. I do not ask this for any high-flown personal interest of my own. No, I am far from this; I am a realistic person. I have realistically assessed my capabilities. I have realistically assessed everything which I have done in the past year and I consider that I am not contributing just one little grain that may be a little larger grain by doing something good for our common cause. I have not overestimated my strength and possibilities and I would like at the very beginning to ask that those people who helped me before -- and you, who are helping me and teaching me...Your frequent prompting is invaluable to me.

(4.) S: After every meeting with you now, my brains begin to work fresh and to contrive new things. I am now an inventor within the framework of the possibilities open to me. With respect to my desires -- you have nothing to say. I am face-to-face with you and you can decipher this for yourselves - whether this is my actual wish or whether it is artificial. What do I want? I want you as soon as possible to test me again; to try me out on important matters, on any task which is within my capabilities to accomplish using my education, my training and everything else which I represent and which I have shown you. I very much want you to test me, as quickly as possible. (Here G warns Subject to keep his voice down.) I do not say that you do not believe me -- you who are here and are already my dear friends, my comrades in battle. This I reject. But perhaps somebody who does not know me, who cannot look into my eyes like you, will say, "Perhaps he copies all this about rockets out of Pravda", or something like that. No, you must excuse me but you must understand me correctly -- I am a human being. I am mature. I am going towards fifty as are you -- maybe Mikhail and Joseph are younger, that is in age, but perhaps in experience they are older than me -- I cannot say. J: Thank you.

(5) S: What else do I want to say? How do I evaluate the situation? If the governments which I now serve -- the high commands which I serve and which I will continue to serve -- value a little more highly this effort of mine, which was done under conditions of exceptional danger, and of definite self-sacrifice, believe me... Well, thanks to my small intellect -- for it is small -- to my extensive experience and training and study, to a certain experience -- "I was creator", (English)- in a specific set of circumstances for myself -- and everything. Thank God, it has gone well for me. This is how I approach this, and if I am not right in this respect you must correct me in a comrade-like way and I will evaluate things differently.

TVORETS'

#7

(6.) S: How do I evaluate this for myself? If there is real value in what I have done already, God grant; and if you believe in my great possibilities and want to do things just as I do so that I can be useful to the end -- if I am not just an ordinary run-of-the-mill person for you, for your (our) commands and for your government -- then attention from above to me would be an appreciation of my work and of my desires for the future. That is how I see it. If the Americans who helped me did something worthwhile - reward them. If they earn a material reward -- this is an indication that you value me. If you do nothing for them -- or just a little -- well, then I am also only a little item for you now and in the future. In that case: simply say this to me; I will nevertheless work. Perhaps I am mistaken.

(7.) S: I talked to you of such high level material -- all this links our intelligence work with politics. I studied the laws of dialectics in this connection, and some laws are absolutely right from the point of view of not assessing things in isolation from the circumstances under which a person's ability and capabilities and desires are involved. In this connection, I think very progressively, I consider, for our time.

(8.) S: If you consider that I am "so-so", then I too will reach this conclusion because when I asked you to reward WIENER - already a week has passed and you have said nothing. I ask you to consider how he should be rewarded -- to give him money. I shall soon be going away and I do not yet know if you are going to reward him. Will you give him money or not? WIENER needs the money; WIENER has done everything to bring us together, so that I can completely fulfill my life's mission (with you). If you consider my opportunities, talks, ideas, abilities are small, you should say to me "Keep silent. Be more modest. Be quiet. You know you think a lot of yourself". I do think a lot of my opportunities and I think that I can do a lot. Of myself as an individual, I do not think very much, believe me. What I will have is enough for me together with that I will have with your help.

(9.) S: But I want to do such great things -- so that I will be your "Number 1" -- first of all for your governments and for your high commands and for the basic goal, which is the means for fulfilling our common tasks in the battle against Communism. This is what I wanted to say; therefore, you honor me I feel. You already love me in your way -- as a friend, as a comrade. You believe me. But all the other leaders are not here -- those who direct things. May God grant that you can convey to them all my wishes and possibilities. I am sure that this will be done. I am sure that time is necessary for this.

But you understand, my rebellious nature. You know that I am an extravagant, lively, energetic person. I feel that you are still taking my measure, still studying me. For me, this is a somewhat drawn out moment. Perhaps there is some contradiction about me in your eyes; if so, tell me. Perhaps I can clear it up, because I believe in my power and possibilities and in the truth - with a capital "T" - of all that I have told you, and am telling you and of what I will do and of what I have already done. In the light of this I ask you to evaluate me, to report my words. This is my declaration and my request. I ask that before my departure on either the 2nd or the 6th -- I will know tomorrow which day -- you will have evaluated me. I ask that you will say, "You know what? Everything with you is medium. You do not need to concern yourself about such great matters because others are thinking for you". When I decided to come to you, I did not think all this out lightly. I ask you to understand me, to evaluate me correctly, to believe in me, and to give me as quickly as possible a severe mission so that I can fulfill it. Perhaps then you will evaluate me differently. I want you to use me only for big things. All my demands and requests are subordinated to this.

(10) S: Now I will check through the thoughts which I have prepared -- and noted -- I think I have said everything. Then I will go on to some questions which I want to report to you and to listen to you. I said to you that I do not want to do only small things. (S trys to break in.) S: Just a moment, I will finish shortly. For me, the measure of your attitude will be the way in which the government assesses those two (Americans), WINNE, and yourselves as well. You can say to me "What business is it of yours how the government regards us?" Well, alright. We have come together and have worked together and will work together. It is not a matter of indifference to me how the work that you have put into our collaboration, for the good of the common cause, will be assessed. Let us hope that all will be well. May God grant materials, fortune, well-being. You understand that I only want to work on large principles, serious principles and let them be dangerous ones. I am sure that if I were to perish, if anything should happen to me, you would not forget my daughter, my mother, and my wife. You know my suggestions about this and you would contrive something, and you would not leave them in a material lurch.

(11) S: You know that in the Soviet Union the material side of life presses hard on everyone. Even a minister who receives 12 to 15,000 rubles a month -- if he has not saved something and if they get something on him and he is driven

out of work and he uses it up or drinks it away and has debts to pay or something else -- after this he just drags his life out. The minimum living wage of Socialism is now established and what sort of wage is it? It is really a gray and hungry life - believe me. I live in Communism-myself and my comrades and colleagues as I have already told you. But one must think of the people - the foolish Russian people. The Russian people are fools - they are good and fine - but foolish. They allow themselves to be easily tied up. Then they endure continuously -- perhaps there will be something better tomorrow, perhaps the next day. Thank God that there is bread and salt and that is all there is. The people are fools who cannot organize themselves. But if we can establish conditions under which the MVD cannot shoot them in the head from behind then these people will say that they have suffered enough and have been deceived too long. That is how Lenin came forward with such a jump in 1917 when the Tsar took such completely wrong attitudes to many of the peoples' questions. If there had been a more clever Tsar, there would have been no revolution.

(12) S: Listen, I can tell youall kinds of things. With us in the 7th basement where the MVD sits, there are chambers where Russians -- prominent people from the point of view of Patriotism, wise people -- were exposed to rats. I was told this by a man who knows. This was said by the former Adjutant of the MVD, a colonel under ARTEMEV. I have all his details. There is one special room which is completely glazed. Anyone who cannot be broken or who will not say what they want him to say, or who will not sign something, is put in the middle of this room. There are pipes leading into it made up of clear plastic. Through these - there is no exit above or below - they release dozens of rats which run around the man. Through a microphone they say, "Well, now, will you say with whom you are working". If the man does not confess or says, "I will not tell you who I was working with or anything", they open a valve which releases a single rat. The rat, who has not eaten for several days, begins to run about and to bite the man. Then they let in 2 or 3 more. It is terrible! People have gone out of their minds. When they want to they turn on water under high pressure and the rats are chased away, back to their cages. The Russian people have been tortured and shot. Everyone knows this.

13. S: KHRUSHCHEV can see that if in addition to this grey, half-starving existence is added the further (horror) of imprisonment or execution -- like it was in STALIN's time -- of course, STALIN had support all around -- then the people might really say "The hell with it!" This is why he is making little

inducements. For instance, he made a general amnesty for those who were chewed up by rats, or shot. To their families, he gave pensions. They get pensions -- not very large -- but they get something. Or he rehabilitated them for life, so that the son or daughter would not have to put down that their father was imprisoned as an enemy of the people. This would immediately incriminate them from the very start.

(14) S: I could tell you about some people from the GRU, perhaps you know some of them. We can talk about this some other time. I wanted to make some sort of statement -- a declaration. You have worked with me exactly a week. I beg you -- and I will be only grateful to you if you will tell me, "You know, (Subject's true name), everything is not as you are aiming for -- reaching for. It's sort of mediocre and we really don't want to use you; not in the various ways you have suggested. So, take it easy. The whole thing does not appear to us in the same grandiose light as you think". Or explain to me in some other way. I don't want to put my words in your mouths. I only ask you to use me for big things. I am ready. I am still strong -- comparatively young -- healthy -- and I consider that I have resources for "big things". What kind of big things? So far, I have offered (my ideas) to you. If you consider this all suitable - and as it should be - then I ask you to develop (the plan) and give me support and security so that I can execute it. Tell me, "You will arrive on the 6th and on the 15th you have to blow up the KGB". At 11: o'clock in the morning on the 17th, the KGB will cease to exist. Just give me the means to do this and there will be no KGB! Now I'm finished with what I have to say.

(15) G: On the things you have said - on certain points we can give you answers right away. In the first place, we trust you. In the second place, we wanted to not check -- but to find out why you desire this. I want to tell you that this will be done. In the third place, we want you to be perfectly at ease about WYNNE. After all, we are going back to London and everything will be done properly. S: (Interrupting) After all, I'll leave you now and I'll see him. He's really a wonderful guy. I am very much taken with him. Believe me, this is all very objective. There are no personal considerations of qualities which would be of help in matters of our mutual interest.

(16) S: Now WYNNE had organized a dinner. After sitting around a bit, I excused myself and said that I had to call London -- the Embassy. There's a line at the Telegraph office. Then I went for a walk; I left someone to take my place -

a professor. I told him to write up his reports. Yesterday they were looking at the entire laboratory. Today they were looking at the Walter ALLEN. After this, I will not call you. When I come back I will go to sleep. Breakfast is at 8:15. We get up at 7:00. They feed us well. We are all delighted with the hospitality -- at the largesse -- and this you have done all through WINNE. Who does all these things? You're not sitting there. WINNE is the one. Even though this is a small matter -- only a grain of sand -- it is part of the big thing we are all doing. G: We are aware of all this, but while he is running back and forth between you and the representatives it's impossible to tear him away, in any sense of the word -- even for 2 or 3 hours. When he comes to London, everything will be taken care of properly.

17. S: Well, I'm closing my "testament" with this paragraph. I want you to trust me completely, 100%. In order to gain this, I want and demand that you give me an assignment which will guarantee me full recognition. If at present you trust me 99% -- this is not enough for me. 99% is not enough; I want 100%, or nothing -- or kill me. G: How about 105%? Okay. Okay. S: Please understand me correctly, because we don't have much time. We have to make concrete decisions, or do you have some questions?

18. G: We will meet again tomorrow. S: We have not the right not to meet every day. G: You will let us know whether you are leaving on the 2nd or the 6th. If it's the 2nd, then we'll meet for the last time on the 1st. If it's the 6th, then we'll meet on the 5th. But beginning with tomorrow, we will have the full schedule worked out exactly.

19. G: Good! Now, what I wanted to tell you -- after all I can't say 50 words at once instead of one word, or 50 thoughts. I gave you a list of 60 people taking the first course in the Military-Diplomatic Academy -- future officers of Strategic Intelligence. But what I did not mention is the fact that after these people were accepted into the course, they were assigned to various directorates, and theatres of war. In other words, our student from the very first day receives (training in) the basic language with which he will be working. He is assigned the specific country for which he is being prepared and he is given training in the specific theatre of war with which that country is concerned. All the Chiefs of the Directorates, have been and will be members of the Board of Examiners (EKZAMENATSIYA KOMISSIYA). Each candidate is seated. There is a long table opposite - about where Mr. Joseph is sitting -- and there sits General SHOLIKOV. Next to him is your relative, KHLOPOV, and here all the

Chiefs of the Directorates. Here, the candidate sits and I am sitting here. Everyone is writing things about him -- what color eyes, what height, his appearance -- does he look like a Turk, for instance, or an Armenian or an (OSETIN) or like a Finn? No one says a word; they write quietly. Then they decide - IVANOV is accepted. I told you before 150 persons applied - 90 were sifted out and 60 were accepted. There were various reasons for this -- I won't go into all that now.

20. S: When all the students are accepted, by order of the Chief of General Staff, everyone is entered on the roll. Each one gets assigned to his place; then they are dismissed for a vacation until 1 September. Now all the Directorate Chiefs get together - I was there too- and the bargaining begins. For instance, some blond character might be desired by both the Finnish and the European (group). He is entered, in this case, in both groups. There are many cases like this. Then they bargain; the decision is based on seniority and usually is a just one.

21. G: Does it work on the T/O system? For instance, a large Directorate but no slots open; there are so many slots according to T/O? S: But we are not preparing them for a Directorate. We are preparing them for overseas duty. Those that are left over will find a spot temporarily even if it's not according to their designation (PROFILUY). For instance, I was studying Japan -- when I was in the Academy, when actually I had nothing to do with Japan. I knew everything about it, including the Tusearera Depression and its depth (VPADINA TUSKARORA). So, they divide up the people. They have a sort of plan - in perspective -- in numbers. The Chief of the First Directorate gets some people - in excess almost of all the other directorates -- that's BERZINIY. He got 18 people, among them your acquaintance - SHCHERBAKOV, who will be trained for two years.

22. S: SHCHERBAKOV knows two languages very well and has experience in agent work. He used to be an Illegal. What's the purpose in training him for three years? Why give him a language? They'll give him all the highest science, training -- whatever he needs. G: Why no more than two years? S: He doesn't need anymore; that's what BERZINIY said. If it's necessary, he can finish in one and a half years - in other words, half a course - and he'll be given a diploma - and a "pip" (ROMB). I've got two of them. G: Academy of the Soviet Army? S: No. The one from the Academy of Frunze says "Academy of Frunze" just like that; the other one has VASA (VOYENNAYA AKADEMIYA SOVETSKOY ARMII). Actually it is the VDA (VOYENNAYA DIPLOMATICHESKAYA AKADEMIYA).

MDA
VDA
VASA

Anyway, the Illegal has grabbed 18 people. Why? Because there is stress on Illegal Intelligence activities. S: He took the best people. Who were these 18 people? If you will give me a copy of the list (I have not marked it before), I can tell you who is in the first group and who is in the second. (Note: Subject listed 10 illegals in his first list but did not know about 8 others till later.)

23. S: Now who is picked for Illegal Intelligence work. They must be young and, as a rule, unmarried. There are 8 unmarried people in this course. G: What does young mean -- 28, 27 years old? S: Under 30. I said, young and preferably unmarried. Oh! This is the first requirement. G: Why unmarried? S: Because it isn't always permitted to take your wife along. As you know, according to our laws of socialism it doesn't do to break up a family. Of course there are married Illegals; they go abroad with their wives.

24. S: Now, let's go through these quickly. I've forgotten many of them already! You know what I did not mark down before in the list which I gave the American friends -- my "instructors -- interpreters" -- that list was not alphabetical. There I wrote the last name and the initials; I did not write out the entire name and I did not indicate where the man came from. There, I had the rank, last name and the initials. J: Education? S: Yes, education. G: Language and the country? S: That's right -- language and country. The language determines .. of the foreign languages .. and again there is an argument. Again they say, "What language shall we give to (Subject's true name)?" Some say, "Let's let him study Turkish." Others say, "No, better let him study English; he won't make it in Turkish". Do you have the first list? G: It's in London. S: In London? Let's do it in London then, so that we'll have them both together that way. If you want we can go through fast. G: No. It is better to be more accurate and thorough.

25. J: Just one question before we leave the subject. He had one man there -- Canada, United States or Japan. Maybe he can explain it.. S: I understood you. These are all BERKHEEV's people. He says "I'll either send him to this country, or to that one". That's why. G: BERKHEEV said this? S: BERKHEEV. He said, "He is suitable for this one or for that country." I'll be thinking about it. I already know (since I heard this) so I put him down for both -- so that he's between two. Because he might not be named for one country and then suddenly be sent to some other country later!

#7

26. S: Now, what I must say before I forget about it -- out of these 18 people, the ones to pass all the tests, checks, and meet all the conditions, God willing, there may be 5 -- out of all those 18. This is the proportion, and the relationship of the chaff and the wheat. The chaff will go and work for some other directorates. This is important to remember. Well, we've decided to work on this over there later because the list is there and we will do it completely.

27. S: When you were asking me yesterday about our group in the Committee, I forgot to give the name of the Captain. It is Captain PUTILIN, Boris. He was getting ready to go to Spain, as an Illegal. I was confused - he does not work now at the Institute of Foreign Languages, but is working in the Foreign Department of VOYENIZDAT. We have a VOYENIZDAT -- Military Publishing (House) of the General Staff -- and there we have a great deal of material in foreign languages. There are many instructors there from our Academy, and others. This is sort of a secondary echelon -- they let people work there who are not completely trusted. Maybe this will be the place where they will send the man who should have been shot in the United States recently but was let go - MELIKH.

28. S: The Institute of Foreign Languages is now being amalgamated (OB'EDINYAYETSYA) with the Military Diplomatic Academy and it will be under the direction of your relative; let's get KHLOPOV out of there. However, write this down -- this is very interesting - how things hang together logically and realistically. This course (FACUL'TET) INOSTRANNYY will be in Lefortovo. It will be under the Academy, but the Chief of the Academy and the training command (KOMANDA) will get into cars and go from the Sokol district to the Lefortovo district, Tankovyy Proyezd, House #4; right next to the BRONETANKOVAYA AKADEMIYA imeni STALINA (Armored Tank Academy name of Stalin).

29. S: What's more there is already in that House #4 on Bronе-Tankovoy Proyezd, a special Section which I forgot to tell you about. Now I remembered -- a Section of the Second Chief Directorate. The Chief is Colonel LEBEDEV. This Section only works on all the intercepted material -- all the Radio intercepts, and all other material obtained by Radio Intelligence which I told you exists in each country. All these materials flow into the hands of Colonel LEBEDEV, on Tankovyy Proyezd, Dom #4. G: And it's called Lefortovo? S: No, the district is Lefortovo. There is the River Yauza... G: And there is a big hospital there? S: Yes, it used to be called KOMMUNISTICHESKIY Hospital, but now it is the Hospital, name of BURDENKO. But it is also a military hospital, under SMIRNOV, General-Colonel, Chief of the Chief Medical Directorate and it is located in the second house.

#7

30. S: Remember the red-head? I had a certain connection with LEKSEEV when I was on the area desk. Remember I told you about the agent who gave information on the CHET-NESHATUSNCHIYE USTROYSTVAN (computing devices) from Pakistan - these materials wound up in his hands. He had two specialists there -- they were decoding experts. He asked me to ask the agent with what speed the discs turned, the frequency of number repetition, etc. I contacted the REZIDENT -- and the REZIDENT, through the operational officer, asked the agent (whom we are going to hang soon -- but only after I come out). (Joke) Thus, this LEKSEEV, Colonel, has a section -- not a sub-section. He works on intercepts, decoding, putting together intelligence reports (SOSTAVLENIYE informatsii) from intercepts, etc. G: To whom is he responsible? S: Directly to General of the Army, SEROV. Directly. But he coordinates his activities with your acquaintance -- the Colonel who is with our Radio Intelligence -- RIABOV. Their immediate supervisor is Lieutenant General (GENERAL-LEYTENANT) TRUSOV. This name is familiar to you? G: I know him. He was in Germany, the chief. S: That's right, that's TRUSOV.

31. S: I want to ask you people - my next point - to advise me; help me; to point out to me -- and what you direct will be my order - the listing and the priority sequence of all my assignments. Here is my idea of what I'm supposed to do when I get to Moscow. First - the working out and the details of plan #1. This is what we discussed before in connection with strategic targets. I'll make you an outline with dimensions, on each separate sheet of paper I'll repeat again data about the General Staff because the other data was somewhat abbreviated and possibly there may be a few inaccuracies. At that time I was working at high speed; this time I'll be doing it thoroughly. In addition to the basic area orientation, I will give the logical places, most suitable, which I think of for placing a large TNT equivalent, for the purpose of blowing up the targets when it is necessary to do so. This is the first thing which I should completely work out. As long as I am talking so much about such big things I must, from my end of it, give you sort of a documentary plan. Then I will take it upon myself "VSUY MOSKVU VYPOLNIT" to put the entire thing into action. If you say that this is too much for you to do, please give me another order.

32. S: May I continue? Secondly -- I'll be working now - and since working with you I understand it even better -- to collect all available materials in Illegal Intelligence (Operations) beginning with the theory; the lectures; specific situations (cases). The SOV-SEKRETNO (Top Secret) will go under a special category. Perhaps in this theoretical part we will find some keys in order for us to apply prophylactic measures. This is how I

see it. Of course, I do not promise you that I will get you the entire illegal AGENTURA. G: This will be a slow process and will take a lot of scrutiny. S: Yes, scrutiny as to who - what? I know, for instance, about SHCHERBAKOV; I know exactly. He's a big (or healthy) one. I know this will be - they may let him go out in one and a half years. He's been checked and trained before. They need a man like that - he is prepared in all respects. I will study this matter from all sides. I feel that this is a very important and big part of the work, because the basic threat to us comes from the direction of the Illegals.

(33) S: I also want to repeat that there is one task which confronts the Illegals especially, and all of us, including myself. Generally, the entire Strategic Intelligence has the basic mission - to warn the Supreme Command (KOMANDOVANIYE), the Central Committee and the Presidium about H hour -- of the start of an attack on the part of the Free World. This is the basic mission -- to warn the Command of the beginning of a war, even though a few minutes beforehand. For this purpose tremendous resources are being developed. This continues to stress the importance of the point I was making when I told you the meaning of Radio Intelligence. It is carried on here, in the U.S., and everywhere. This is their bread, because the AGENTURA is sparse -- there are not many valuable agents. Of course, there are some here (in Radio Intelligence); however, it's very concrete -- actually whatever is picked up can be recorded just as it is. For this reason methods have been developed so that with the help of these stations, duplicate radio intercept stations, the rest of the radio stations which are normal-working, cable transmitting stations. Signals can be sent to RPs, since they are closer -- the RAZVED-PUNKTY are also equipped with radio. There is such an alarm signal already worked out -- as soon as this signal is received, Envelop #1 (KONVERT NOMER ODIN) is opened. There is one at the RP for the duty officer, and the signal goes on further - to Moscow. It is relayed by all possible duplicate means -- VCH (High Frequency) - other radio stations - etc. S: I feel that my basic task at present is to alert "my" governments - "my" command. In other words, I consider the above as my mission in reverse; namely, to provide you with Early Warning. The other missions which I don't want to break down specifically are: methods of work; categories of science; various channels through which things are done -- whether it is Radio Intelligence, Illegal or Legal REZIDENTURA. I speak of it as Legal because it is operating under some kind of cover but not under the APPARAT of the Military Attache. This last I stress and underline again. All these things can be considered as supporting and developmental data..

(34) S: Now, thirdly, I want to undertake -- since I consider it very important for you to know -- all the methods used to train an Intelligence Officer in his work. I will collect all their lectures on Intelligence and

on Operational-Tactical matters, because there are some ideas inserted in between the doctrines. They have the (troop) density calculated for each kilometer of the front. How much of each type of weapons (SREDSTV)? How many people? What type of equipment. All these lectures I will get for you also. Now, Technical Intelligence -- with which I am connected directly at the present time is all in my hands. I can get you a suitcase of this material. What can I get for you? In the first place, I told you, there are 150 intelligence items listed. S: There are 150 intelligence requirement items. For 1961, these were sent as (TEKHNICHESKOYE ZADANIYE) (requirement missions) to the United States and duplicated to all countries. These also exist for each country. For instance, I have 30 intelligence requirements specifically for Canada. These are, for example, to get their methods for making artificial fur on fabric backing. Then there is also something on non-ferrous metals. Many requirements are scientific. Scientists assign them and then they are all gathered together in the GNTK. For the United States there are 150 requirements in all fields of industry, manufacturing, agriculture, everything. In the field of Agriculture there is even a requirement - it does not seem to work for us - how to grow vegetables not in the ground; but in artificial soil like sand and chemicals. It's some sort of discovery. The requirement is to determine what the components are. You see, even these assignments are performed by Intelligence - and we think that we can divorce Politics for Intelligence! How can we do this? We can't!

GNTK — Technical Intelligence requirements list for Canada

(35) S: Now, and I repeat this because this question may come up again, why are all these copies of the 150 requirements sent to all the other capitalistic countries? Because there is much of the British and American (science) in other countries of the world. If you can't get into the U.S. and you can't get into England - then clear up this question in Germany - that's all! That is the fourth point.

(36) S: The fifth -- as I said on the whole and generally speaking -- is to alert you through all channels available to me if, God forbid, they decide on some adventure - so I can warn (you). S: As far as counter-measures to take-prevention, this will be for the command and the government to decide -- we won't have enough brains for that!!

(37) S: I would like to add something - this is aside from the ACADEMY and the Academy, where you received training on rockets. That's all well and good, but when you have your VOYENNOKOMANDNOYE DELO (Military Command Training)

ACCESS. Military Command Training

can you get into the SECRETNIY FOND and get copies not only of lectures, but of some special Manuals -- the latest Field Service Regulations, for example. They will show us not only the philosophy, but any change in the doctrine regarding the use of atomic weapons. S: Concrete estimates? G: Concrete estimates - this must be given as a part of the training because the army is being developed and trained. S: The army is being prepared. G: Now, I don't know whether you are aware of this or not -- I had heard that you are doing away completely with the Corps structure within the army. S: KORPUSNAYA SISTEMA? G: That's right. The Divisions are directly under Armies. S: That is exactly right or they will be Divisions of the Reserve Command - RVK. (GEN units) However, some army corps still exist; they are doing away with it slowly but many have been already eliminated. That is correct.

38. S: Secondly, the Rifle Division no longer exists as such; it is now called the Motorized Division. S: You are already behind; it is called Mechanized - not Motorized. It is called MSD (MEKHANIZIROVANAYA STRELKOVAYA DIVIZIYA) -- the Mechanized Rifle Division. There is not a single horse in a division, and there is not a regiment or a battalion that will go any long distance on foot. Trucks are provided and ... auto-battalion, which is employed per movement plan. They load them on trucks, and one auto-battalion follows another, etc.

39. G: And similarly, your former Mechanized Division -- the Motor-Mechanized Division -- does not exist any more, but is called simply Tank Division. S: The Tank Division.. G: Is this right? S: Not quite correct. There is a greater percentage of Tank Divisions, but there are still some Mechanized Divisions which are comprised of Infantry Brigades. G: This sort of thing is very important to us - and it is possible that there might be some new use of atomic weapons. God knows what else there will be! S: I am sure that there will be new seperate Rocket units and where there are Rocket units, there will also be nuclear weapons. If there are no Rocket units, as I gave you already, there may be 320 MM mortars and a cannon, which fires atomic shells. G: This will explain many important things to us about rockets; that is, the subordination of the units, the allocations, responsibilities, etc. How they plan to organize the new military divisions. What the present status is. According to Tables of Regulations, this will show new military theory. We may find some tactical doctrines here. I will not call this the Number 1 mission, but it is high on the priority list of things which are of interest to us, especially, since all this is available to you. S: Absolutely. This is how I have already written this. Here,

I'll show you this place again - lectures on Intelligence, on Operational-Tactical matters, etc. G: You've written it down? S: Yes. I was writing this in my room -- operational-tactical matters -- just as you said.

40. G (lifting a glass) Well, here's to your health! S: Thank you. I am quite well! It will be sad for us to part, but we will think of each other every day. Let there be no day in which you will not think of me, or I will not think of you, even for a moment - not only when you receive the material from me, but anytime. G: Of course, certainly.

41. S: Here's what I've prepared. G: That's quite a list! H: Yes, it's quite a list, but I think...we can bring out all these other subjects later on, and refine it. G: Fundamentally, all this is fine as a basis; we will work over all these questions very carefully and make them even more specific. S: I wanted to ask you whether you might want to add something more to these. G: We'll add some more. S: Or, perhaps you'll say, "(Subject's true name), this Technical Intelligence, even though I have it down as point #4 - let it stay that way. But the lectures on Operational-Tactical matters, you had better put over here".

42. G: We will do just that. Now, here is a small question. What is the actual period when you were at the Rocket Academy. S: Military Engineering Academy, Name of Dzerzhinskiy. The courses are called VAK -- VYSSHIYE AKADEMII CHEESKIYE KURSY (Higher Academic Courses) under the Military Artillery Engineering Academy, name of DZERZHINSKIY. The courses were given by order of the Chief of the General Staff. G: When did you yourself enter? What month - and in what month did you graduate? S: I entered 1 September 1959. You remember, I was preparing for India for half a year and from 5 January to 29 February, I was hanging around in the Reserves. G: But you were still going to school at that time? S: No, not then. I had finished the courses then. G: That was 9 months of the course. S: They figure this way - they are calle called yearly (GODOVYYE) courses. However, the political preparation -- there was a bit of that then -- the history of ... not the Civil War ... Military Science (VOYENNOYE ISKUSSTVOO). All this was canceled for me because I had two diplomas. I only studied the technical equipment course, rocket firing. There was no political work for me, absolutely. But the rest, they had the full cycle. G: So you actually graduated in January? S: No, I graduated and received the diploma -- the certificate (SVIDETEL'STVO) -- on 30 April, on the eve of 1 May. I have a copy of an attestation (ATTESTATSIYA) for this period indicating with what rank I entered, how my studies went, evaluation and assessment. I have a copy; I will send it to you.

43. G: So, all the time that you were in Reserves, you were still going to school? S: I attended a bit, but I was relieved of all the Liberal Arts (GUMANITARNYKH NAUK) and was studying only the equipment and rocket firing. So, concretely, my studies are from 1 September 1958 through 30 April 1959. G: That's better. This is what was confusing me, now it's clear. S: I have the certificate with the seal - with OGENTSOV's signature as proof. You might think something amiss with me, but you have made the mistake by a year. G: I did not think it possible that you could be in the reserves at the Academy and getting ready for India - everything at once. S: I told you about the Reserves. I was still studying and working, but it was not according to schedule. This was by my own desire. Now, 1 May, I was off -- the order just came through to prepare me for the Indian area. Beginning with June, I was sitting for 6 months -- up to the New Year. I came in 1958, studied until 1959 and at the end of 1959 I greeted the New Year. On the 5th of January (1960) I was called in to SHUMSKIY - 2 months in Reserves -- then on the 29th of February I became chief officer for those three countries which I have mentioned -- until June. Then the examining committee (MANDATNYA KOMISSIYA) began screening candidates. This brings us into 1960.

(44) S: I was thrown out as the Chief of the course (NACHAL'NIK KURSA) -- to speak roughly. And 15 November 1960, I was in the Committee. Didn't I tell you before? I started (school) there in 1958, and I was going to school through 30 April 1959. I went (to classes) every day, and was the Chief Political Officer (STARSHINA PARTORGANA). G: We had figured out that all this was a year later. S: No, no, no. I was sitting on the area desk and took part in the examining committee. I may have accidently mentioned one year instead of the other. I beg your pardon. G: Now it is clear.

45. S: I repeat again - 1 September 1958, the order was already issued about my enrollment in the course and school started in September. As far as dates go, I saved myself 2-2½ months. Oh! -- another thing -- they also gave a little preparation in languages. That language which (the student) had studied before -- but very little, perhaps once a week for an hour, sometimes two, but this very seldom. I was relieved from this also even though I don't know English very well, but it is at least 100 times better than the rest who were going to school there.

(46) G: Shall we finish your notes now? S: We'll finish right away. I want to ask you not to attempt to work on the members of my delegation in an agent capacity (V AGENTURNOM OTNOSHENII). G: No - of course not - under no circumstances. S: There is some good material there that could be used, but better you don't. G: Of course.

#7

47. S: Now (reading notes), in regard to the photographing - to leave it or not. The members of my delegation, when they are traveling they quietly photograph things. On the outskirts of that town where I had trouble with my stomach, they photographed rockets which were standing to the right of the highway. Then further on there are airports. I've read that one of them is for the civilian Air Force of Great Britain. Then there is one -- I don't say it is, but I understand that it is for American Fighters. I don't say I know. Then there is one more airport, all on the right side if coming from there.

48. S: Now, yesterday morning I stopped in one of their (delegates) rooms -- no, it was day before yesterday at Leeds! His windows looked out on the railroad -- the train station at Leeds. There is nothing there but roofs, but you can see the tracks and observe the fact that it is a Railway Station, a terminal. That's about all. So I asked myself -- shall I leave them or not? They leave their cameras in their rooms -- perhaps I should take them (delegates) out somewhere, and then someone could go to their rooms and take them? G: No, that's alright. S: It's alright? Well, it was my business to tell you about it; it won't bother me at all. Of course, if I was doing the photographing, they would say to me"shame on you!" G: No, it is better to leave them. Let them go back with something to boast about - it will be better for you.

49. S: We'll talk about this some more. There are still some questions I want to ask in regard to my Intelligence Assignment. Do you think you can help me? G: Yes, yes. S: A little bit - and also we have to decide about the man ...can work out a legend -- where I met him. I can introduce him and leave him - the devil take him. It doesn't matter to me what goes on after the introduction, that's all that concerns me. Now here is what I request. Tomorrow I meet with the REZIDENT, in London. I have to report to him the results of the trip, what I saw, etc., whether there were any provocations, offers, etc. I wanted to confer with you on this matter. My task is to pass any information of the slightest interest, which I may obtain through acquaintances, or see myself, or steal, or stick in my pocket or my brief-case. This must be sent through the REZIDENT, addressed to the name of my Colonel, the Chief of the Section, ROGOV. G: The Colonel? S: Yes, the Colonel. All this will go on to AFANASIEV. G: Do you have the name and patronymic of the Colonel? One can go crazy with all the ROGOVS. You've got two of them. S: Vasiliy Maksimovich. G: This is Vasiliy Maksimovich. S: So, the envelop must be addressed as follows -- this would go via diplomatic mail - ROGOV, V.M. -- you see, I wrote it down ROGOVSKIY. This I must give to the REZIDENT. If I have nothing for him, then I have not fulfilled my Informational Assignment. So, I ask you to give me a little something which will not be

detrimental to our cause. G: You will see him not only tomorrow but the day after as well? S: According to the plan I am supposed to go and see him tomorrow, but I can manage not to go tomorrow if that is better. G: That will be better. S: I can go the day after tomorrow. G: That will be better. By that time we will receive some materials. You will look at him and you will be able to say to him with confidence that you have obtained such and such information on - and really know about it - and not be speaking about what you might get and how, etc. It will be difficult for you to explain from where or from whom you obtained it. It is better to get it first and study it. S: So, I won't go tomorrow. G: Tomorrow, when we meet, we will already know more about it all. S: Alright.

50. S: The next matter - I would like you to arrange for permission for us (the delegation) to take a very superficial, quick look at either the FERRANTI or the PLESSY Firms; this is because the Committee has received an official telegram that both the FERRANTI and the PLESSY would be available to the delegation. This helped me quite a bit at the time. It was WINNE who sent the telegram -- I asked him to whom he was in Moscow -- saying that "I confirm that both FERRANTI and PLESSY visits are available". It is not necessary (to see) both of them -- either one or the other, and show them just a little bit -- (in English) a few. Don't make a big deal out of it. Don't make up any stories -- just some little thing. Otherwise, there will be nothing in my report, or my specialist's report about either FERRANTI or PLESSY and both were promised as available, as WINNE confirmed. Just to give a general familiarization with one of the firms because it was promised. Here we were at LEO's and that is alright. What I have not mentioned to you or have not had time to say -- when I was having the chat with the RESIDENT, he told me, "I warn you, the British CI has assigned you Andrew, a translator, Andrey KARLOVICH. He is a SVOLOCH, such a man ...", and he went on to tell me what a dangerous person he is -- "be careful not to talk in front of him". I tell you all this for this reason -- as an intelligence officer he is a very good man. He knows the English Language very well and is a very pleasant man generally, an exceptional man. Of course, this is my own opinion - my feeling toward him although it is well masked. I tell you this because you must not ever use him again in the open. You let them "get onto him" right away. They all know him and are afraid of him. So if you ever assign him to someone again, they will say at once, "Here is the plant again". Let him work in the position of a third man -- but they know him. This is what I wanted to tell you.

#7

51. S: I wonder why there was a confusion over the dates. I thought I gave it right but you had it a year later. G: I suspected as much; this was just for the purpose of getting it more exactly. S: I think that you have put everything down correctly. I told you everything as it was. The courses are PERIODICITY from year to year. They always start on the 1st of September -- the basic and the supplementary ones as well. The courses are held under a directive of the General Staff, the announcement regarding them is made the beginning of July and they start screening people. I stuck my nose in there too, because I had heard that the situation was such that this would be helpful to me. I already had small plans for the future -- more concrete, but small -- and I went to school 4 months in 1958, and up to May 1959.

52. G: That is clear now. Here is a small question. As you see, we don't have too much work right now. You reminded us about some things yesterday and we have some more photographs ... you probably recognize these. (Subject looking at photographs.) S: Yes, I will see -- No, this is not on Red Square - this is the MANEZH; this is the Kremlin; this is the University; this is the MANEZH. This right here is the V-75, and this is the same thing. There were 5 or 6 rows of these -- and 4 columns to a row. No, this is the Bol'shoy Theatre -- no, no, it's the MANEZH. G: Since we are on the seventy fives, there are more photographs here. There will be some more like this, I'm sure. Can these be adapted for atomic use when necessary? S: No, these are only for Anti-Aircraft use. Why use atomic weapons against aircraft? This I have never heard of and have not seen any such instructions.

53. S: (looking at second photograph) Here is the second stage. Here is the dry fuel and here is the thing itself -- here is the pilot tube sticking up. G: That's clear. Now, how is it guided after the ground control guidance system is cut off? S: First, it goes up from the ground. I gave 2 systems for guiding and then, after it is guided to the trajectory on which the target is expected, the rocket goes by itself and the rocket detonates upon arriving within a lethal radius of destruction of the target. G: At what distance is this - is this controlled by a radio impulse or what? S: The distance is the computed one at which detonation would destroy the aircraft and this is automatically set in the rocket. Of course, it would also detonate on contact but this is not relied upon. G: In other words, it detonates on a type of proximity fuse. S: These are considered to be reliable rockets; they have been proven and they are being produced in quantity and are being given to PVO units. These are the rockets fired at Powers. They are considered to be a good and reliable rocket.

54. Q: What did you mean when you said that 96 can be fired by a battalion? Of course, this is not a salvo. Is this what you call a unit of fire? S: We call this a unit of fire (A MK or BOMBENSTELLUNG). For every type of rocket, in fact for every shell of every gun, the MK is different. Q: Therefore, this is the unit of fire for a V-75 rocket battalion. S: Yes. A certain number are on the starting pads and in the ready position and the balance of 96 are back further in reserve.

55. Q: What is the inter-relation between this type of battalion and anti-aircraft guns and fighter aviation? S: How do you mean this -- by kilometer of front -- or for a particular defense position? Q: Well, let us assume a defensive position such as the city of SVERDLOVSK. S: I understand. The ideal situation is not yet attainable for the simple reason that there are as yet not enough of these weapons. Theoretically, the defense of a target is computed on the basis of the size of the target's frontage which is to be protected. A rifle division should have at least one such rocket battalion to protect the division front. This is for computing purposes only and since there are no [illegible] forces at this time there are only strategic targets to be defended.

56. S: For example, when I was duty officer and on the 1st of May 1960, this incident with POWERS took place. I heard that for the entire SVERDLOVSK area, which is large, there were only two such rocket battalions. And, incidentally, the battalion whose rocket had damaged POWERS' plane was the second one of these two and had only been deployed a short while before the incident. You will not yet see in manuals exactly calculated numbers of these units per military formation. The basic estimate will be computed on the kilometers of the front. This, of course, will be flexible because the depth of the front and the dispersion of vital targets therein will play a role in determining the allocation of rocket battalions. Of course, from the viewpoint of administration and tactical control, the Army commander will have a number of such battalions under his control to allocate to the sectors as he sees fit.

57. S: Insofar as the PVO of the land is concerned, each commander places whatever rocket units are given to him in the best defensive position to protect the vital targets in his area to the fullest degree that he can. Until more units are available, he must do the best he can with what he has. There is no such thing as one battalion per ten kilometers of defensive front. Of course we would like this, but thus far we simply have not yet obtained it because we do not have enough units.

58. Q: Have any rockets been developed that can intercept a plane flying under 3,000 meters? S: No, there are no such rockets. Such planes will be defended against by anti-aircraft guns (up to the limit of their ceilings) and

by rocket-carrying fighter planes of the type I told you about. Since the MIGs can fire four to five kilometers above themselves with these rockets, you may consider that they can defend up to an altitude of 25 kilometers.

59. G: Still on this rocket - here is a theoretical question. Suppose planes are attacked from different directions. How does the commander of the battalion decide which target to engage? S: That is a difficult question. Today the PVO expects attacks against major objectives such as Moscow and Leningrad to come from what we call "star formations" or planes attacking from several directions at one time. To defend against this, rocket fires are assigned approach sectors to defend in, and they will engage the nearest plane which enters their sector. Of course, if simultaneous attacks are made from all directions they should be engaged by all units, but this is impossible because we do not have that extent of defenses yet.

60. G: Of all the equipment that you have listed for the V-75, there certainly must be special radar control units specifically designed to service the V-75 battalion. You did not give any details on the specific radar unit. S: In the organization of the PVO of the Land there are all kinds of early warning and radar stations which are integrated with each other and are used to control anti-aircraft fire, etc. These are, of course, integrated as auxiliary help for the rocket battalion. All I gave you in my description was the specific electronic controls and units indispensable to aid and fire the rocket. To have this completely integrated with the PVO radar system is what we are desperately working on. This is one of our greatest deficiencies, particularly where electronics are concerned. That is why such great emphasis now is being placed on the development of electronics.

61. S: In addition to this there is another great deficiency -- that is deficiency of personnel. I mentioned that we have added the 5th department of electronics to the rocket academy and even though 2,500 students attend the academy, we say that it will still take two to three years in order to have sufficient personnel in all branches -- in Radar techniques - in Technical equipment - and war heads, etc. So I say, KHRUSHCHEV needs at least two to three years in order to be ready in all the areas. All these "sausages" which they are assembling (KLEPATUPNYA) in the factories, simply because they are making so many of them, and which are stored under ground and in other areas, require personnel to service and maintain them from all angles. At present there are very few people like this. From the strategic viewpoint, the time to attack is now - a year ago would have been even better. Every day he strengthens his position.

62. G: There isn't much description of the (PELENGATOR) Radar, which services and belongs to these, the V-75. It just says that it is connected to the radar and that's all. S: Yes, we were given only the principles of this in our course. G: I see, you were not given details. S: You see, if I were really paying a lot of attentionto it ... I was more concerned with the technical equipment aspect of it - in its possibilities and construction. I still think that in these courses, there were more professional engineers, technicians - and of course there were some line officers. This technique is not new - this radar aiming computation for the rocket. I could get it but in the course I took we were given the technical equipment, the working principles.

63. (Another photo shown Subject, #2) S: This is a guided rocket. This top part can be taken off, and there are some assembled without this cover. G: I see, this little basket. S: It isn't a basket really. It's on this rotating swivel (VERTLIUG) and it actually holds this rocket. I think during the first parade two of these were shown - let's see, two, four, six of them.

64. S: This is not the R-2. G: Not the R-2? S: Not the R-2. We did not study this rocket operationally (AKTIVNO). Wait a bit - no - this was a very poor photograph. This is not a guided rocket; this is a free rocket, dry fuel rocket (PORCHKOVAYA RAKETA). That's right. This swivel comes off. This is the 3R-2. It isn't a guided rocket. This, by the way, is the base for the set-up which I was describing to you - the launching installation (PUSKOVAYA USTANOVKA) on the hull of the tank -- the amphibious tank (PLAVAUYSHCHIY TANK). G: T-76? S: That's right, T-76.

65. G: Are these T-76 tanks heavier than your new T-54? S: No, this is an old model. This is why they are considered so expendable. The turrets are removed; the frame is made over to make a launching ramp. Yes, this is an amphibious tank. They are considered to be in the middle category in regard to their trackability (PROKHODIMOST), etc. This is a free rocket. I couldn't make it out at first; couldn't see the head because the shadow of the jacket was in the way. There are no more of these. Let me tell you something - they put on this covering simply as a red herring (TEM' NA PLYTKEM' NAVESTI) so that under these covers (KOZHUKHI) one would not be able to see the locations and types of connections, unions and all the other equipment. They don't have this one any more and we did not study this assembly.

#7

66. S: (Looking at photo #3) Here - these two things - this is the R-2. G: This is the guided rocket? S: Yes, yes. This is the carrier which transports it from the storage station to the assembly point when it is already on the technical position. The carriers have a special lifting mechanism, and by this the rocket is lifted to the launching pad. Now to go further, it is attached in two places -- I wrote about it - there are bronze bushings (VTULKI) which hold the guying ropes until the moment of release when the rocket is given free flight (SVOBODNYY KHOD). This stuff shown here is, excuse the expression, junk, trash, -- as far as guided rockets are concerned. Their idea was to show something very large. This thing is very long. See, in other words, what a colossal thing we have! This is the old R-2.

67. S: (Looking further at picture) Here was the American Embassy - then the Hotel Nationale. These over here are all free rockets and here is the Anti-Aircraft unit (ZENITKA). Here were the famous KATIUSHI (rockets in racks). I described them before -- free rockets -- two rows of them. What kind of parade is this? These are all R-2 rockets. This we have already defined - here let me have the magnifying glass. Anyway, they showed R-1 and R-2 at the parade.

68. J: What's R-1? S: According to military SOP this shouldn't be like this - the columns are formed this way and these are formed later alongside and the order is from the smallest, the KATIUSHI, up to the largest - to these sausages. Very typical is the fact that the R-1 was not shown in any of the parades - or the Hawk (KOKSHUN). I haven't seen the free rocket with liquid fule. I saw only one parade with rockets, it's true. I was alone and I saw the preparations for the parade on the airfield on the Leningrad Shosse - near Sokol Airport. Three or four times they marched past beginning with the drummers, the band, and finishing with these things.

69. H: (In English) I think we'll go on at this stage of these questions here about various other ones of interest. G: Yes, you mentioned that there are other... S: Not 2, 3, - these are 7. I wrote in one note... G: Is there an R9? H: R9, 7 and 5? G: The R5 is there. S: I emphasized the R5, 7 and 9 because they are identical in construction and all are large in size (RAZMA) and in range. But the R7 and R9 rockets are not yet in serial production. Many are being made but not on a conveyer system, but of course machinery and rockets and technical equipment can be made in great quantities without a conveyer - not mass production. All the rockets are identical and have big range...I mentioned them because they exist but we did not study them. But with the R5, I saw it and opened the cover (CRYSHKOL) and looked into the cavities. It is formidable. G: But it is not in serial production. S: No. G: How about the R-14? S: I only referred to the R-14 but it is not in serial production. They mentioned it. The range is greater than 1000 - the R-14.

#7 CORRECTION

70. (G explains in English) Well, now what are they working on; what are the difficulties? One can enlarge a rocket our of proportion (RAKETU RAZDUT' NE PO MERKE), as they say -- in length and in width -- but then it is necessary to tie in (PRIVYAZAT') and to develop the corresponding electronic apparatus so that this rocket can be brought through the active phase with the necessary speed/direction. Recalculations begin and these lead to the foundation of new electronic techniques. This is where the blockage .... It is necessary to assemble the casing (NAKLEPAT' KOZHUKH); to arrange all the spaces with all these feeding devices, turbo connections and so on. This is no difficulty. The technical recalculation to make a larger combustion chamber is no problem -- the development of combustion chambers has progressed well, the deficiency is that the metal does not yet meet our requirements. They are working on high-heat, resistant steels. They have developed some that do not correspond sufficiently to the demands made of them. G: And the even numbers which are not completed -- what were these? Experimental? The R-6 or the R-8? S: Yes, experimental. They receive these numbers. They all existed. They go in order. They work -- perhaps there is some modification or addition and perhaps there will be an R-8 or R-10. If there is an R-14, there is an R-13. H: There is already? S: But they have not mentioned the R-13 to me, therefore, I did not mention it because I did not hear of it by ear, not once, and I did not see it.

71. G: When KHRUSHCHEV said that there are already rockets with a range of 2 to 4,000 kilometers and that they are even producing larger ones with a collosal range, was he right or not? Or have there been experiments in which they were fired accurately at a target? S: In such large questions of strategic rockets and attacks with strategic weapons, he lies and puts out what he wants as if it were true, believe me. You can check this as you like through other channels and you will hear the same. There are rockets like those which launched the Sputnik; there are intercontinental rockets with which one can fire from one continent to the other -- a warhead and its carrier. On accuracy, he lies like a gray stallion. I swear to you that these were the most exact data which I could collect on the vertical, the lateral deviating over a trajectory and on the deviations of accuracy (RASSEIVANIYE) of free rockets. And the position is very difficult because electronic technique is unreliable -- sometimes they do have successful experiments, but it is still not firm enough for adoption on a massive scale. He can fire a rocket at South America -- but to say it will fall on Cuba in support of our forces who are supporting Castro -- he lies like a gray stallion.

72. J: Excuse me, how do you know this? Is this your opinion? (In English) S: No, it is the opinion of Marshal VARENTSOV -- my opinion is not enough (in English). You know you are putting questions of an engineering nature to me. Even when I was on the course, I did not thoroughly understand because I have no basis for this, and I did try. I blindly accepted what was written down, what I heard, what was in my notebook, what was in the summary, what was in the manuals (NASTAVLENIYE). There were five manuals covering the whole course (POTOK) (SYLLABUS) and I, as leader, took one whenever I needed it. The data were absolutely accurate for that time. There are now working to decrease the lateral deviation and range deviation to attain greater accuracy. But I never did hear that there had been any progress made. VARENTSOV says, "There is not a damned thing, only talk." New models are made, tests are being run. In some particular aspects there are successes and elsewhere there are complete failures. But tests are going on everywhere; new parts are being designed, built, and tested. Cadres are being trained quickly and in large numbers, but there is still a mass of shortcomings. And when Mr. Eisenhower and Mr. Nixon -- especially Mr. Nixon -- said that, "We know that you have been unsuccessful in developing this and that", ...of course they were absolutely correct -- and it would have been funny if he had been asked, "How did NEDELIN die?".

73. S: One small incidental point -- say you had gotton together and said, "Look, you (KHRUSHCHEV) seriously want to come to terms with us about coexistance, disarmament, etc., but how can you be believed, when in your own name and in that of the Central Committee of the Praesidium, you falsely stated to us and to the world about how NEDELIN died. What difference does it make how he died? It is a pity that he died, let us say in general, but how can we believe you when you lie about such a great man?". What would he say to you in reply? You could really expose him by confronting him with this fact. G: He would probably beat on the table with his shoe.

74. J: Ask him about the 3 at the beginning of the series. G: What is the significance of the number 3 which begins the series? S: Free rockets have the index 3, as the index 8 is used for all guided rockets about which I mentioned earlier. Even the heater, where the hot air is pocketed, begins with the number 8, since it is used for guided rockets. Thus it begins with an 8. But for free rockets this index is 3.

75. G: And your V-75? S: No, the V-75 has several variations, as I wrote. They also use 750. Why do they do this, while others in the Garrisons of the OKRUG say V-75? BIRYUZOV and his

staff say 75. But for study purposes they say 750. How did these contradictions arise? V-750 came originally from the DZERZHINSKIY Academy; the director there is ODINTSEV. They could tell your relative in the academy, "refer to this as V-75". I'm just giving you this as an example. Whenever camouflage designations are used, I'll give you both since I know what they are. G: Has it been in serial production for long? S: I estimate like this -- as I understood all the instructors -- that this rocket was already (developed) in 1956 -- the V-75. G: Probably there were improvements? S: Still again, I will repeat my thoughts, though I am not your professor. Every year they perfect it and they will continue to perfect it. But there will not be any significant changes from the basic model which they have. G: This answers the question.

76. S: Now I will ask you -- on engineering subjects -- do not put big questions to me. I said this from the very beginning. To present the material in the form I did was my idea -- I thought it best. I wanted to put everything about a rocket on one page -- length, construction -- all details, but I thought this must be known. I thought perhaps this way would give "my" scientists -- yours I mean, American and English -- a helping hand. Perhaps they think that the Russians are doing this incorrectly, or perhaps it is progress. For that reason I did it altogether and possibly I made a mix-up. This is a proper question you asked, to the point .. that the data on the V-75 guidance system is very general. I have not had them yet, perhaps I shall be able to get them in detail. Well, there is not much new. J: When he copied these documents, was it a complete copy or did he extract what he considered significant? S: I will tell you. The information on the R-11 rocket, I copied completely, but some of the sections on the other rockets I copied fully and others I copied as it seemed to me "the main idea" (in English). I wrote so much that I got a corn as big as this, on my finger .... then I copied it out. I had the idea of typing, but I would still be typing. And then I wrote it out twice, since you would never have deciphered my abbreviations.

(77) S: When SHUMSKIY summoned me about the unpleasantness about my father, about which I had worried so much -- then I was quite glad..... I was quite glad when they put me in an ops section because it showed that they trusted me. They gave me agent contacts, operational code, a seal, the red book -- everything. Well, during this period I deciphered all the material and copied it out. I already had a feeling of mistrust towards them, my intuition which has not deceived me. Sometime after November I went to the selection commission for the MDA course and after that in 1960 I went to the GNTK, and I tried to give you this material as quickly as

possible. It had been with me for eight months -- I am thinking of 12 August when I had my first encounter with foreigners. Already two months before this everything was typed and ready.

73. S: Once again I tell you that there is nothing additional that is particularly new on these rockets. Everything additional, as it becomes known to me, I will get to you in detail. That is what I wanted to say to you on this subject.

74. G: How quickly can the V-75 be combat ready? S: All rockets are normally kept "dry", as it is called -- you know the expression -- a "dry rocket". The fueling equipment and machines, booster, of course, the charges (SHASHKI) or "KONFEKTY" (candies) as they are called .... There are small KONFEKTY and large ones for the R rockets. These are all stored in hermetically-stored containers. I wrote down the sizes of the wooden crates for the rockets, and for dry fuel. There are large metal ones, air-tight. The fueling equipment is not badly worked out. Under pressure, the fuel is loaded quickly into the rocket compartments -- how many seconds it takes, I do not want to guess. All this already exists. The V-75 interests you, doesn't it -- just for preparation to fire?

75. G: How quickly can a second one be sent up after the first half has been fired? S: A rocket which is already charged and on its launching position .... As soon as the command "I "prepare to fire" is given, the crew begins to prepare the second rocket. They bring up the necessary equipment and begin. The rocket is brought up on its carrier to the launching pad. The sequence of command is like this. As soon as the commander has given the alarm, already from a distance of 3-400 kilometers, the radars transmit from one distance (GLUBINA) to another point closer to the position showing that the hostile target is approaching. The command is "IDET TSEL". They are already starting to prepare rockets. I wrote all about this preparation.

76. G: And do you think China is getting rockets? S: They are giving rockets to China. G: Already? Which type? S: They are giving them all the types that are in production. They are giving everyone free rockets and guided rockets. Mao Tse Tung had very outspoken talks about progress on this subject in Peking. He wanted us to follow his road. That's what it came to. That is what several people have told me.

77. G: Do rocket forces have special insignia? S: None at all. Only the artillery uniform with black (insignia) PETLITSY, cannons on the PETLITSY; if an overcoat is worn, the national emblem, stars, black piping on the cap. No special insignia. They have taken away the symbol which the anti-tank troops had, a cross.

There was no need for it. One can still tell parachute troops. They have a parachute designation and a metal tag to show how many jumps a man has made -- ten, twelve, one, three, a hundred....

78. G: Do rocket men not wear special insignia even in Moscow? S: Of course not. I saw a photograph of a man who has been made a Hero of Soviet Labor four times -- a rocket constructor -- and there have been many people who have been a Hero of Soviet Labor three times in radio or electronic equipment. They give them money and so forth secretly, but this is not published in the newspapers. Awards are constantly being given in secret and now KHRUSHCHEV says ..... Under Stalin, awards were given to excess. No, there is no distinguishing insignia -- in order to camouflage them and not to distinguish them differently in the Army. You could photograph the rocket people quite easily -- those who live in the dormitory buildings. Count them up and note into which entrance of ours they go. The others live on the Academy premises. But there is no special uniform.

79. G: The soldiers -- the signal troops, the engineers, etc., -- do they use their own service insignia? S: They are considered auxiliary troops -- the signals, chemical engineering troops are presently considered important branches of their respective services. G: Have they taken away their insignia? (ZNACHKI). S: They have left them their emblems (EMBLEMI); there is no change. There is nothing new about the uniforms as regards the insignia. There is one sort of uniform which has been developed for officers -- and is now being issued -- a jacket, with a split in the back. Both the parade and the daily uniforms are khaki. The parade uniform is worn with gold shoulderboards, and cap with gold braid and all that junk, and the rest is khaki. I know uniforms "exactly".

80. G: And the RB-47? How did you hear about that? Who was the source? S: I heard exactly that our patrol forces and our radar detachments, which were in that sector, detected an aircraft and located it, and put up our aircraft, one of which came close to it, and shot it down over neutral waters. We know this very well. But we could not admit to KHRUSHCHEV, "I am sorry. Excuse me, I am to blame -- I destroyed it at the wrong place. He hadn't crossed the frontier, but I bagged him". -- SVOLOCH. I was told this by Sergey SERGEYEVICH and by Vladimir FEDOROV who has now been in Germany for two years.

81. G: What is FEDOROV? S: FEDOROV now commands a brigade and was formerly the Aide de Camp to Sergey Sergeyevich. G: Of these same rocket forces? S: Yes, of course.

82. S: Perhaps I am exaggerating our possibilities but it seems to me that it should be easy for us to know everything that is going on in Germany exactly. Therefore, we can immediately set ourselves this task. We know that there are these four brigades because (Subject's own name) told us -- two brigades equipped to fire atomic missiles. Where are these brigades? Force a German to locate them for you. There are storage areas under ground. I was told this by GRIZLOV. Nevertheless, he said to me, "We have not enough protective devices to protect the personnel who work with these atomic weapons -- their hair falls out because of the radioactivity and the radiation to which they are exposed. People are afraid to go in. They are paid; they are told that everything is normal and fine and safe, but they are afraid. Within a short time -- a year or 18 months -- they become ill. Something is lacking. There may be safety measures under laboratory control but this has not been yet done for combat situations.

83. G: You also told us that there were earlier cases in which people like NEDELIN ..... Was this known definitely? S: Definitely. Mr. NIXON could have spat in KHRUSHCHEV's face when he asked whether there had been cases of unsuccessful launchings and KHRUSHCHEV said, "No, there were none. You are a clever chap, you have figured everything out". There are disastrous cases to this day. I give you my word of honor. At first they didn't send up a man but living matter, plants, biological specimens, etc. Then they sent up a robot which began to work in 10-15 minutes, with the help of signal impulses sent from the earth and which was the model of a man -- an automatic man. There are many volunteers who are keen to go!

84. S: Do you know about the sputnik which was lost? Well you know that they launched it at cosmic speed -- you understand cosmic speed; there is no need to talk about it? It is generally known. Well, it was launched and then they lost control of it. G: Did VARENTSOV tell you that? S: No, they say this quite openly in general discussion and I repeat this as rumors strung together. Everyone knows about them -- FEDOROV, BUZIN, VARENTSOV, several other generals. I will give you a list if you like.....

85. G: Are the Moscow defenses around the town all completed? -- the anti-aircraft guns, the rockets, etc.? S: I will tell you. We, the General Staff, believe that you see Moscow as target #1 on a list of 5 targets in order of significance -- Moscow, Leningrad, and all the oil districts like Baku, which is a special zone. The PVO has a center there. I mention this to you so you will know in general of the number of such defenses. These are excellently defended. There is emphasis on the Urals, where heavy industry is

defended. There are defenses in front of the Urals and behind the Urals. V-75s have been sent there because your aircraft have often been detected there. I give you my word of honor that when your first flight came over in the direction of Kiev-Kharkov -- there was one flight there that we knew about, where the Soviet air space was violated but there was nothing to shoot with. Now that the new rockets have appeared, KHRUSHCHEV has given the order to fire. So they shot at POWERS on the 1st of May. There were (defenses) before but not in quantity and they were not able to go into action as quickly as they can now. They existed, but not in the right direction..... BIRYUZOV was reprimanded because he had not correctly estimated the probable direction of the flights from the point-of-view of importance of the targets. That is to say -- they would have fired when this aircraft from Turkey flew over Kiev, but there was nothing to fire with -- the aircraft escaped. POWERS would have escaped if he had flown 1 or 1½ kilometers tothe right of his flight path.

86. J: To your knowledge, how many such U-2 flights were there that you heard of? (G translates). S: I know of five such flights -- I know exactly because I was told by someone who would not mislead me. I would work with him "in the dark" (unwittingly). He is Major General Andrey Romanovich POZOVNIY, head of the Political Directorate of BIRYUZOV's PVO, the former deputy to VARENTSOV in the Political Section on the 1st Ukrainian Front. VARENTSOV had him promoted to Major General.

87. S: Immediately after the war, VARENTSOV began on a series of jobs which I will try to explain. He commanded (the Artillery) of the Central Group of Forces, the artillery in Lvov in the Transcarpathian Military District, then the Artillery in the Transcaucasian Military District, Tbilisi, and then, when YAKOVLEV was jailed, and the late NEDELIN -- who was the commander of the artillery after VORONOV -- called him from Tbilisi and put him in charge of GAU, while ZHDANOV was a Colonel General. VARENTSOV immediately modified the gun which needed a cooling device, for which YAKOVLEV, a Colonel General, was jailed. POZOVNIY lost touch with VARENTSOV at that time -- they respect each other; go to each other's homes.

88. S: POZOVNIY lives near SOKOL. He has a flat and is married with two grown-up sons. POZOVNIY went to work in the PVO with Marshal BIRYUZOV -- in political work. Then he quarreled with BIRYUZOV and it is interesting how a big chief can bite a lesser one. BIRYUZOV is a Hero of the Soviet Union. In Lyubertsy, we have a sort of engineering base, in the hands of BIRYUZOV. He ordered them to make him ten duplicate Hero of the Soviet Union medals. The

original is in gold with a number but these were stamped out of brass in the same design and dimensions. He planned to wear them on one jacket or another in order to protect the real gold ones. That is what he wanted, but POZOVNIY came to Lyubertsy to inspect the garrisons and said, "What is all this about? Is this some sort of Mint? The Mint is in the Kremlin and in Leningrad. What are you doing?" They said it was for Marshal BIRYUZOV. POZOVNIY went too far. He reacted in such a way that they said, "You are making yourself look foolish. Do you think that some subordinate will wear these stars? Or will pass himself off as a Hero; will get some sort of reward?" This is not allowed -- forgery either of the national emblem or of medals and orders. He clashed with BIRYUZOV and was kicked out to be Deputy to the Commander of the PVO zone in Baku. I often meet POZOVNIY and I will bring him a present from Great Britain. He is a good person. He is a political worker in the PVO. He is just back from Baku. He didn't want to work there because he left a large 3-room flat in Moscow. In Baku, he lived in a hotel. His sons are grown up. His wife has moved into the flat. He has just arrived and has set himself up in Moscow. He will work in the PVO again somewhere. He is a great source for us. There are a good many people there.

89. G: Do you know whether they are preparing air-to-ground rockets of great power? S: Yes, they are preparing them from a fighter aircraft. They are working on them but I do not know anything concrete about any models. The one which was developed from the submarine rockets, the P-5, has been issued to the land forces already.

90. G: What about anti-missile missiles? S: They are working on them too. This is the type which intercepts a missile on its trajectory. They plot this trajectory from the moment of its launching to determine its course and to bring about impact at a certain point, as they try to with a V-75 and an aircraft. G: There is nothing in service? S: Nothing. Perhaps there is something on paper but they are working on it.

91. S: Now something else they are working on -- once again I draw your attention to it. It is the development of a fuel of the highest possible calorific value by means of atomic disintegration in the rocket and to launch the rocket with this fuel. If they do this, it will be "something terrible".

92. G: Does the Air Force have its own V-75's installed around its bases, which are subordinate to it? S: Why should the Air Force need the V-75's? We have battalions armed with V-75's under the PVO of the Land, which protect the Air Force and its bases. There is no reason to give theair forces V-75's organically. The PVO has them, as well as the aviation.

#7

93. G: On the R-5, does it need a launching platform or a foundation? S: A foundation is essential. Otherwise, it creates difficulties. Time is necessary and so forth. It is necessary to reinforce the ground. All launching platforms are also reinforced by means of guy wires. By the way, I can send you a part of the rocket. I have one which I put in my pocket with markings of #8 on it. It is a level magnetic plate. The magnetic plate is put in any position on the rocket in order to level it; it is particularly used to level the launching pad.

94. Presumably they are already building sites for bases for the R-5 or are they not often displaced? S: This is a very good and very correct question. Very many engineering troops are already building sites in predetermined directions in order that a firing platform and all equipment for rockets can be quickly set up. Whether this will be fully used, or whether it will be abandoned, that is question #2. But the construction is going on throughout the territory of the Soviet Union. Where the siting is exactly determined, construction is completed (SDELANO POTEMKINSKIYEM).

95. (Discussion between G, H & J on agenda and on the next question to be put.) G: We are trying to ask our questions in order. S: As I promised you, in the very near future you will be informed of the address where the Captain 1st Rank, with whom I was on leave in Sukhumi, works and near him, is the assembly point of all the parts (UKLON) which arrive from all directions -- a central control zone. All suppliers' deliveries are checked here and he is concerned with this business. You've assigned me this task; the name of the Captain 1st Rank and the town will be given by me. G: You have already mentioned the town where this assembly takes place. S: No, I told you the one in the East, but not the one in the North. There are docks that do this. I know this. "Exactly". I promise that I will work out this whole question completely. G: The town in the East is Mezmalinsk? Did you give the exact location? It is 200 kms east of Kazan. S: No, no. G: Here is the map, see for yourself. (Discussion of location of Mezmalinsk. It eventually transpired that Subject meant Zelenodol'sk, a town which he had visited twice and in which he had stayed overnight.) S: During the war U.S. ships (KATERI) were assembled there. At that time Rear Admiral NETSVITSKIY, now dead, was stationed there. The Armenian engineer General VARDANYAN lives there.(Subject explained that he must have mentioned Mezmalinsk in connection with the boundaries of the wartime Moscow military district and defense zone, which extended from Kalinin to Mezmalinsk. Discussion then turned to the location of Perkhushkovo, where Subject had reported MOSKALENKO's headquarters to be.)

96. G: Has he a big headquarters there? Approximately? S: It is a big headquarters numerically, but how many rooms are there? About 600-800. For each section (OTDEL), there are 2-3 rooms if it is a small one, and 3-4 rooms if it is a medium one. They are still building houses there. (Further discussion of exactlocation of Perkushkovo. Looking at map.) S: I remember I always took the electric train from the BIELORUSSKIY VOKSAL. There are several private houses there. It was formerly a country estate. This was always the center where the POLITSOSTAV (political personnel) carried out its retraining (PERESPOSOTOVKA). Even POZOVNYY studied here at one time. G: How many men would you say are there? 1,000? S: No. More. There is now a large cadre directorate. They have everything, administrative people as well, and they are still building large villas for the courses - grey granite and grey roofs. I was there. J: How many kilometers from Moscow? S: I must think about this more exactly. You must go through Kuntsevo in the woods. There is no Perkushkovo railroad station, and you must go from the nearest station by foot or by car, or straight by car from Moscow. G: If I said there are 1,500 on the staff? S: Probably, but I will not guess. I will find out exactly, because this is a basic headquarters. I will tell you the exact number of kilometers and will tie it in to these other towns. I will consider this essential and 1st task. Previously, my driver took me and he knew the road.

97. S: Can we now think about the question which I mentioned to you the day before yesterday? Give me a small recorder, so that I can put the questions which we need answered and record conversations with VARENTSOV and with other friends. Now there is a 2nd question to think about. Should you give me a pistol in the near future? I have no gun at the moment, nothing. I used to have a very good German officer's pistol but they took it away from me. One is not allowed to have arms. I had a German one with a red marking, a WALTHER. Now I have nothing. Is there anything to prevent me from having something like that? G: There is nothing to prevent you, but isn't it dangerous for you? Why should you have it? S: No. I will have a Minox or.....I ask you to think about it. I think I should tell you what I am thinking about.

98. G: Can you give us any details about this naval rocket -- the P-5? S: No. Everything that they told me was reported. G: Do you know how it is (launched) vertically or at an angle? S: Didn't I write that it can be fired inclined? G: Even under water? S: It is fired at an inclined angle by land troops. G: But one can launchunderwater rockets either at an angle or vertically. S: Absolutely right, on submarines - how is this done, what are they like? When this matter was taught, I put the question, "What sort of launch (START) does it have?" He (the instructor) said, "inclined". I said, "How is this solved?" Technically, when I was in the course they taught me

that for an inclined launch the launching installation (USTANOVKA) must be 4-5 times longer than the rocket. In other words, if a rocket is 8-10 meters, the launcher must be 40-50 meters. One could construct this, but it would require huge supports to keep everything rigid. He said, "(Subject's true name), they have solved this question technically". But how it was solved he did not say. G: On submarines? S: No, for land forces. I do not know how they do it on submarines.

99. G: When he told you about this how did he tell you? Did he say "incidentally, there is such a thing", or how? S: It came about like this. His wife said, "(Subject's true name), I am writing a scientific paper. I am doing secretarial work for a candidate paper of Volodya PARKHOMENKO, my husband. He is the head of the Staff". I asked, "What is the subject?" She said "Rocket forces". Well, what to do? He was a senior instructor instructor at the Military Political Academy on the Bol'shaya Sadovaya. I met him and he said, "We are beginning to instruct the new students in these rockets". I said, "What rockets? I don't remember such. . did not study them in the course". He knew that I was in the course. Well, so on and so forth .. As soon as he left I wrote it down, but it was my question, "What sort of launch? Vertical?" I put the question to him. He respects me and he told me, "inclined". I said, "How can it be inclined? I was told by engineers that an inclined launcher is used for guided rockets. This is simply done for small unguided rockets but it must go progressively -- the length -- the launching installation (USTANOVKA) for large rockets of a great weight". I said, "It must be 4-5 times longer than the rocket so that it can be launched". "This has been solved". That's all he said. G: What are his forenames? Vladimir Ivanovich also Fedorov. Is Vladimir Ivanovich the man who was in Germany, the former Aide-de-Camp?

100. G: Did this PARKHOMENKO tell you that there are about 10 submarines -- or was it at a lecture? S: I heard, in general, that there are submarines with this rocket, but they did not tell us about it or instruct us in it. I heard this from others in the General Staff. PARKHOMENKO never worked in the General Staff.

101. S: One detail about him which you can check -- after he had finished at the Dzerzhinskiy Academy, he married a girl called Ella. She has two daughters. This wife's stepfather was called SELIVANOV, a Colonel in the KGB who worked in Germany. There, he had an affair with the daughter of a Lt. General and she had a child by him. As a result, he set about getting a divorce from Ella's mother. Ella's father is dead; he is not her father. Olga Petrovna, the mother, worked in the General Section of the KGB. She is a member of the Party, a Junior Lieutenant. She was summoned and dismissed; they wanted to expel her from the Party. Why? They said that her husband, Col. SELIVANOV,

had gone over to the Germans. S: Olga Petrovna is the mother of Kila, the mother-in-law of Volodya PARKHOMENKO, my former Chief of Staff in the 51st regiment on the 1st Ukrainian front. Since then we have always kept in touch. I helped him (PARKHOMENKO) get into the Dzerzhinskiy Academy. There was great competition. I introduced him to VARENNIKOV.

102. S: So PARKHOMENKO married Kila and got to know this Colonel SKLIANOV. We can use this information one of these days. I do not remember SKLIANOV's forename. I know only that he worked in the NKB. He was in Germany on NKB business. You can write down exactly the year when everything happened. It was the year when I had a jaw operation. I had a concussion and my jaw was broken and, as you can see, they put in gold bridgework. It was the year when I had the operation that PARKHOMENKO came to me in the hospital and said, "(Subject's true name), something unfortunate has happened. SKLIANOV came to get a divorce from Olga Petrovna, but she would not give him one". They had no children. S: Well, why is this interesting? SKLIANOV disappeared. He is still not back. Then PARKHOMENKO came to me and said, "He has come. He asked Olga Petrovna to give him his things". He had sent many things from Germany. Incidentally, SKLIANOV is a friend of BEROV's. When BEROV was working for BERIA, SKLIANOV sent cases full of stockings from Germany to BEROV.

103. S: That is what PARKHOMENKO told me, and you tell me that I shouldn't bring back presents. Let me take a moment off for a laugh. (Subject shows his extensive list of items to purchase written in his "order notebook".) Well, SKLIANOV said that he was getting a divorce and demanded the things. Olga Petrovna said that she wouldn't consent to a divorce. I said, "To hell with it! He has become involved with the woman and has a child already, so agree to the divorce". He had a lot of money in the bank (NA KNIZHKE) that he kept in his name and she only had some junk. I told Olga to demand 25,000 rubles and let him go. "You can't hold him anyway".

104. S: By the way, their grandmother died recently and VOLODYA is consolidating this apartment where SKLIANOV lived with Olga Petrovna on Sadovaya Chernoyvseskaya UL. next to the Elektr RR station. He moved into a smallapartment in the Beloshuikaih area and wants to consolidate it into three rooms. The grandmother was buried recently. She was the mother of Olga Petrovna KIRSULIROVA. He (SKLIANOV) did not give her money or anything. He left her; took the young daughter of the Lt. General who I think already had a baby girl, and went to Germany. In Germany, he was arrested. He did not have time to escape. But later, (we) checked through all channels and there was no confirmation of the arrest. I think he escaped; we have to check this.

#7

105. S: This is Ella's stepfather (SKLIANKOV). G: An interesting person? S: A good friend of the pilots CHKALOV and TYUMENEV. He was as close to SKROV as I am to VARENTSOV. G: Where did he flee? The West? S: To the West; she was notified that he was arrested. There was, however, no official notice received.

106. S: She (Olga Petrovna) worked for the NKVD at Lyubyanka, as a Junior Lt.; she wore a uniform. She worked for 19 years; she lacked one year to get a pension. We get pensions after 20 years. Now she has a small job because she was reprimanded along the Party line for her short-sightedness, because her husband happened to be an enemy of the Soviet Union and because she did not discover and report his unreliability. They wanted to exclude her from the Party. Her hair turned grey. She is very patriotic -- a member of the Party -- a Communist, everything. They left her in the Party but gave her a strong reprimand. Not another word was uttered about SKLIANKOV.

107. S: There is one interesting detail -- PARKHOMENKO is in close contact with me and as I was planning to leave to come to England, he called and said, "Dear Oleg Vladimirovich, let's go look at apartments". He proposed to rent a 3-room apartment and occupy two rooms ... to share the apartment. It is hard to get apartments there, you know. But this is beside the point. He is a close friend of mine; he wouldn't lie to me. I had heard about the existence of the P-5 rocket in the Navy, but I did not know details about it. He gave me the details that I just gave you; they are his details.

108. G: Did the instructor tell you about the serial production of up to 10 submarines? S: I was never told this by instructors. I have friends in the General Staff. I will list them and... G: I want to write this down. It is a very important thing to clarify the exact source. S: You see, if this was said about 6 month's ago, it would be alright, but if it was said much earlier... G: I know, two years ago.. that is even more important. S: CHECHERIN told me about this. He was subordinate to me when I was there -- the Acting Military Attache in Turkey. He was assigned to the staff of VVS; I told you. He is a fool, in his ability, development, etc. Let's see, who else told me? Another high ranking supervisor, I can't remember who it was now and I don't want to guess. G: Don't. S: I don't have the right to. G: Okay, don't. This is such an important article that it was necessary to ask. S: I understand.

109. S: I will soon give you the name of the city where the Captain 1st Rank, with whom I was on vacation and the one who works on this matter..I told you that there are docks for the assembling of (submarines) in the Far East.

#7

I will tell you about the north. G: Wait a minute. You don't remember if he told you where he was located? S: I have it written some place. G: If I told you about the city name, would you recognize it? S: No, I have forgotten and I don't want to guess. No, please don't steer me away from what I know; there might be a second place that you know about. G: Fine.

110. S: I told you my biography in such detail that it was unpleasant for me. Why did it happen that for a year I was not accounted for? G: Probably because during our first meeting you told us everything so fast that it was missed. S: I told you, I've had the materials for over a year. G: Well, now it is 1961 already, more than a year. S: That is what I said, I tried to contact you, but did not get an answer. When I tried to contact you, I had all this in the trunk. G: Okay, all this is now clear.

111. G: Now a question that interests us -- this region of Northern Leningrad is not connected with the bases? S: Murmansk Oblast? G: Yes, Murmansk Oblast, but not connected with the bases? S: No, absolutely not. It is connected with the launching pads, made from reinforced concrete, with rockets deployed there and aimed at England, not at France. G: Fine. What type of rockets are these, type R5? S: Exactly, R5, R-7, R-9. G: They are of 2,000 KM range? S: Yes, they have to be because the distance is so much. They are of this series of rockets. The commander of these rockets is clearly MOSKALENKO. S: They were commanded by the deceased NEDELIN, and now by MOSKALENKO, who inherited this command. VARENTSOV has nothing to do with these.

112. G: Do you know the areas where rockets R-2, R-11 and R-5 are deployed? S: By rocket designation, nothing is known to me. G: Yes, I understand. S: In my understanding, they are deployed against all directions of threat, all around in the Far East, against Iran and Turkey. Here against England, a countries closer than England (Scandinavia), especially against Turkey. When the American troops landed in Lebanon--when ROKOSSOVSKIY was appointed commander... this was all done for pomp as well as propaganda. At this time VARENTSOV was there all the time. VARENTSOV was there in the Trans Caucasian Military District, as commander of the Artillery. S: VARENTSOV was in that area all the time, in Tbilisi and traveling in the area, because KHRUSHCHEV ordered everything to be in battle readiness.

113. S: VARENTSOV was there also at the time of the protest to Pakistan and Turkey about the POWER's flight. They expected another flight and would have fired at it, but not with an atomic warhead. They wanted to have another case of penetration of (Soviet air space). They wanted to say, "Look here,

another penetration!" But then he was afraid, afraid to start a war. But they were ready. These battle positions exist, launching pads fully equipped -- maybe the actual missiles are not standing there but everything else is ready. All this is nearby, underground, in bunkers (in shelters) and all camouflaged. Battle readiness implies that when necessary the (rocket) can be set up and loaded; there is no readiness whereby everything is loaded and ready to fire. Maybe the/solid-fuel/(missiles) are ready to be fired -- I have been told that in some places we have solid-fuel missiles. For example, those against England. But liquid fuel missiles are not ready for firing. I told you how the liquid oxygen evaporates, how the fuel leaks, etc. Missiles cannot stand being fully fueled in the open, only in a semi-hermetically sealed, dry place. I know this type of detail.

114. Q: When you write your reports to us, can you give us the names of the twenty students that were taking the course with you in Moscow and who went to MOSKALENKO? S: Yes, I can do this.

115. S: I have a good friend, Colonel L.P. FILIPOVICH. He is the Chief of the Permanent VAKA connected to the Dzerzhinskiy Academy. He was my chief. I don't remember his name and patronymic. He lives on Ulitsa Gorkogo, opposite the telegraph office. I visited his home. He has one daughter who took the examinations to enter the (medical) institute three times, but was not accepted. VARENTSOV wrote a letter and helped her get into evening school at the university, which she attends now; she works during the day at a hospital. He is a good friend. You will see his signature on the copy of the evaluation (KHARAKTERISTIKA) that he gave me upon completion of VAKA. It is typed and has the seal of the Academy. Q: We have this. Here it is. To whom is VARENTSOV, as commander of the artillery, etc., subordinate to? S: The commander of the Ground Forces CHUIKOV. Q: Only? Is it considered to be a separate staff? S: Yes, the Ground Forces staff. Q: And under this staff, is it subordinate to the CHief of this staff, or is it separate? S: The staff of the Ground Forces together with the Commander and his staff, also together with the commanders of the Main Directorates and the commanders of various Arms of Ground Forces -- they are all subordinate to the General Staff and then to the Minister. Q: I understand. S: An ARM of troops is a category. MOSKALENKO has an ARM of troops and so does VARENTSOV, a category defined by the responsibilities and conditions.

116. S: The chain of command is, for example, MOSKALENKO, Chief of the General Staff; the Minister (of Defense); KHRUSHCHEV, Commander in Chief, Lt. General Nikita Sergeyevich (sarcastically). VARENTSOV is the commander of Rocket Troops of the Ground Forces and is subordinate to CHUIKOV; the Chief of Staff, ZHADOV -- formerly ZHUKOV -- and that is the chain of command. When you ask how the command goes beyond that item, you must have in mind the Chief of Staff, his Deputy, and the Minister of Defense, etc. VARENTSOV is unhappy that he has double subordination. He is responsible to the Chief of the General Staff, his Deputy, and the Commander CHUIKOV. Q: Both ways?

S: But organically, his command is part of the Ground Forces. G: I understand, and he is on the same level as other ARMS, such as Tank Forces, etc., under Ground Forces exactly? S: Yes. G: VARENTSOV would like a higher command but they won't give it to him because when BERZLIN died, the highest military Soviet met with your friend KHRUSHCHEV (laughs). He is such a mean wretch, this impudent person who seized power right out from under the nose of everyone. He was upheld by the Secretaries of the OBKOMS. He was Minister of Agriculture for almost 3 days .. appointed by MOLOTOV and MALENKOV. There was this military Soviet to decide whom to appoint (to replaced BERZLIN). The first candidate mentioned was VARENTSOV. They wanted to appoint VARENTSOV. He has many enemies. He is a very severe CHEKIK, very fair, a very honest and good man. He puts his soul into his work. But VARENTSOV does not have enough education, especially highly theoretical; he has not finished a single academy. He didn't graduate from Dzerzhinskogo, Frunze or Voroshilova General Staff Academy. He only attended courses for a year someplace at the General Staff Academy like the General Staff courses I took at the Dzerzhinskiy Artillery Academy. But he studied at the VAK of the Voroshilov General Staff Academy (Note: The Voroshilov Academy has been transferred to Frunze.) -- where your friend is now recruiting Negroes and is establishing an agent network in order to let our Soviets establish their domination there.

117. S: This should be eliminated through all possible means, and I don't think there will be any threat to me if we say that we know about this and explain to the Negroes not to go. Then the University will be closed. (People's Friendship University) G: You think they will go to study there? S: No, only Whites will go to study there. VARENTSOV was named as a candidate. In the past, he was always supported by his former Commander-in-Chief KONEV, former Chief of the General Staff Sokilovskiy. When they left, they became ill -- but they are healthier than many. But VARENTSOV did not get support here this time. VARENTSOV was on very good terms with KHRUSHCHEV since the time when KHRUSHCHEV was a member of the Military Soviet of Vatutin on the 1st Ukrainian Front where VARENTSOV was Commander of the Artillery. I have a photograph as a keepsake that shows Nikita Sergeyevich, SOKILOVSKIY, VATUTIN and VARENTSOV standing together. G: VATUTIN was killed near Kiev, was he not? S: Yes, he was killed when he was in command of the First Ukrainian Front. G: KHRUSHCHEV was very well disposed towards VARENTSOV. Being a turbulent person by nature, I learned a lot from VARENTSOV regarding this.

Vs letter to K

118. S: He wrote a letter to KHRUSHCHEV saying that there was a mess (BARDAK) in the management of the Armed Forces -- certain rockets were held back, funds were not given, support was not given, etc. He wrote it a series of Top Secret material in a letter to KHRUSHCHEV. He wrote it because it is impossible to get an appointment to see KHRUSHCHEV. He contacted an important person who has direct access to KHRUSHCHEV and asked him to give it to KHRUSHCHEV, but at that moment, suddenly, KHRUSHCHEV left Moscow and the letter went to SUSLOV, member of the PRESIDIUM, and the Secretary of the Central Committee. SUSLOV read the letter; it did not mean anything to him. He called in MALINOVSKIY and told him, "Your Commander of Rocket Troops brings up general matters and problems in a sound manner and correctly". The existence of this letter was reported to KHRUSHCHEV much later but the letter was not given to him. The Minister of Defense, MALINOVSKIY, asked VARENTSOV, "What are you doing? Why are you reporting about me behind my back? Why didn't you come directly to me with these ideas and questions?" The Commander of the Ground Forces also wanted to know why he went around the Chain of Command, because they were questioned regarding these matters in the letter, since they are responsible for them. VARENTSOV is a very good worker, and to bite at him directly, they could break their teeth -- but they knife him constantly. When NEDELIN died, VARENTSOV was not appointed to his position. On Artillery Day, everyone expected VARENTSOV to be awarded the title of Chief Marshal of Artillery, as VORONOV, but he did not receive it. They were holding everything back from him. Let's see what happens on the 2nd of September. Will they give him the Order of LENIN or not. (Note: VARENTSOV's new title of Chief Marshal of Artillery was announced in PRAVDA in May 1961).

Red

119. G: Who is in charge of, for example, the adoption of new rockets? Where are they developed, assembled, etc? You understand, not only the quartermaster part but the engineering, new developments, etc. S: I understand. The first scientific center, the brain of rocket technology, is considered to be the Academy in the name of Dzerzhinskiy. Major Generals of the Engineers, the Artillery Engineers and Technical Services are concentrated there. Also Major Generals are department (KAFEDRA) heads; two of them are strong theoreticians who develop designs as heads of the faculties. I told you earlier that there are 4 generals and 1 colonel in the 4th faculty.

Ed who?

Petrenko need

GAU VUS

Prod

120. S: PETRENKO -- you see how I remember names, and you say I start mixing everything up at midnight. G: Is he a general? S: No, PETRENKO is a Colonel, the only one. The rest are generals. There they plan and create scientific laboratories and theoretical doctrines which are later reported. Besides this, there is the Scientific Soviet of the GAU -- it is called Military Scientific Soviet of the Main Artillery Directorate (Voennyy Uchenyy Sovet pri Glavnom Artilleriyskom Upravlenii ya). The main artillery administration and the head, Colonel General ZHDANOV, as I told you before, has concentrated in his hands all equipment production, all the non-military plants of the country that work for the army. He also has a Scientific Construction Directorate, very large and powerful, where all the theoreticians sit.

121. S: Then there is a second center, the Rocket Academy. I did not start with the Academy without reason -- for there they concern themselves directly only with one item -- rockets. At GAU they have many directorates -- electronic equipment; various other equipment, on fuels, explosives, etc.

122. S: The third, in the hands of VARENTSOV, and now, also in the hands of MOSKALENKO -- there are the NII, Scientific Research Institutes. There is more than one. One of the institutes is located on the premises of the Academy in the name of Dzerzhinskiy, it has a separate head and carries out scientific research only. They get what is invented at GAU and transfer it to blueprints, put it on paper. Then the new process goes to the plant for production of the prototype, for testing, etc.

123. S: The second NII is at SOKOLNIKI, not far from the American, now British, Exhibit. It is beyond the SOKOLNIKI Park, about 8 kilometers from the SOKOLNIKI Metro Station. G: Who directs this and which are subordinate to VARENTSOV? S: No, it is MOSKALENKO now. The Academy is no longer subordinate (OTCHISLA) to VARENTSOV. VARENTSOV himself is located at the Academy now, but is to be transferred to Frunzenskaya Nab, to GAU. There the scientific research ideas are being developed very actively and concretely.

124. S: Further, there are many Engineering-Artillery schools where the lower ranking officers are prepared-lieutenants; they study up to five years. This is because the Artillery schools are now also engineering schools where they have Scientific Research departments. In other words, the command pushes all cadres, no matter where they work or study, to think, invent, and create as long as they are in this field (rocketry). Then all these (ideas and thinking) funnel into the Academy, to GAU and to the NIIs. A proposal from the Artillery-Technical School in Rostov-on-the-Don would go along these channels. I don't remember if I told you that there is such a school there and also in Odessa and Riga. Then they analyze what has been produced -- can anything else be done, or not? Perhaps you go into a new field. With this unified effort by all the scientists from all sources, everything is collected and screened. Valuable ideas are developed, and tested, first on paper and then on metal. This is the structure of the Scientific Research work; there is no scientific research in one place.

125. G: Who coordinates all this? S: GAU. This is the highest coordination, but GAU also gets this from the NIIs and the schools. G: I understand. S: And close to Moscow are the towns with the Germans that I told you about -- special technicians. They test things and sometimes get something from them. This is

coordinated by the Scientific Research Directorate. It is like the highest Soviet, which incorporates all the scientists from all the scientific research institutes, academies and schools. It is the coordinating organ.

126. G: What was the reaction when it was announced in the USSR that America had solid fueled rockets which could be launched from RR cars? S: We collect all information about rockets in the American, British and German armies and we are beginning to collect information on the French rockets. We consider France of secondary importance because they use your experience. Yes, we heard of what you anticipated. G: It is called the Minuteman. S: We have heard. It was mentioned and I saw it. I saw a large diagram and if I get a chance I will photograph it, so you will know the Soviet General Staff knows about your rockets. They know almost all the names. Then there are blank squares, some of which are filled in with figures in a pattern similar to checkers, technical data.

127. S: We have some films about your rocket made by the Strategic Military Intelligence. I am sure you didn't present or sell them to anyone. There are films on Redstone and Corporal missiles -- how they are fired; the servicing personnel, I even remember the part of the personnel wear glasses. This was all photographed, filmed. I don't know where it came from; I was never interested. I have heard about the (Minuteman) missile that is fired from a platform. It can move as soon as it fires, which makes it impossible to hit since by the time its position is plotted it is gone. I heard this at official lectures. G: Where did you hear this? S: Oh yes, from whom -- Major General of the Engineer Troops VYSOTSKIY, an intelligence officer, works as Chief of the Directorate. G: Oh! Another old friend. S: This VYSTOSKIY was also on the Mandate Commission by the way. G: He was in the old Bureau of New Technology, ZHUKOV was there; VYSTOSKIY was there; OSOKIN was there. S: OSOKIN was the former military attache to that negro HAILE at Addis Ababa. He got fired. G: And what was VYSOTSKIY's name and patronymic? S: I don't remember but I know him well.

128. G: Is it still called the Bureau of New Technology? S: No. VYSOTSKIY now works on Gritsivets St. in the Information Directorate, as head of one of the Information NAPRAVLENIYE. It is no longer called the Chief Information Directorate or the Second Information Directorate as before. It is just called the Information Directorate of the 2nd GNU, G. Sh. (Vtoroye Glavnoye Razvedatel'nogo Upravleniye, Generalnogo Shtaba). His job is to utilize new technical advances. He lectured to us and told us about this rocket that fires from platforms and is movable and unmaneuverable. Honestly, he had so many diagrams hanging everywhere -- and such junk, nothing concrete. There is only very sparse information. I'll get this information as a supplement, in order to give you a complete and sound engineering understanding of what we know about your rockets.

129. G: Where did he lecture to you? S: At the 5th entrance (POLYNZD) on the 2nd floor. G: You see what important lectures are given there. This means a lot; we did not expect this. S: If I had this thing (recorder) ... 100-150 persons attend the lectures; I would switch it on in my pocket and would listen. It would be easy for me; I would not have to write or think and you would have it all. I understand if I had photographed the whole show there wouldn't be so many questions now. I tell you directly that it is hard for me to grasp fully all the things dealing with engineering -- even though this is what I have written. I am not an engineer, I just write it down mechanically. G: You are completely right. We will keep away from such questions and only ask general questions. S: And you will get general answers. G: Fine, but here, as you have heard, we have an explanation and a clarification. This is also important. S: This about the rays (radar) -- how, where, the parameters, etc., I can't do this. G: I understand. S: There will only be a mess.

130. S: I have a question for you. G: Yes. G: When can we plan to have a meeting at which I can take all the materials, look them over, and give you additional comments? G: For next time, let's prepare the following in order of importance. Then you can present your additional comments and clarifications. S: I can recall many things when I see the material.

131. G: We will meet tomorrow. At what time? You know where. Let's decide first when. You said, not too long a meeting. We will talk for a few minutes now and will decide on tomorrow. You remember Room 360. S: I know this. G: What time is best for you? S: I don't know when WINNE will drive us over. You see I sit next to WINNE; he is a wonderful driver. You have to give him credit for driving me around carefully and taking good care of me despite the traffic. G: Yes. S: And I hear you don't want to give him anything. G: Quite the opposite, we promised to take care of this. S: If you evaluate anything that I have as insignificant, then there is no need to make such sacrifices. G: Definitely not. S: Then tell me so I will understand all this in a different light. G: This will all be done correctly.

132. S: Another question must be considered in view of new circumstances. It is necessary that I be given a telephone number, in case I have to make contact in a hurry. In case I have some unpleasantness -- a threat or something else. Anything could happen. I ask that you give me a telephone (number); I don't care which one. G: We will give you this. S: Fine, so this is definite. This worries me. (The number) should contain a 3 or 11; but don't give me a Number 13. (Laughs) G: Fine.

#7

133. S: Now, we have to finish with the photos. G: This is planned; we have a whole schedule worked out. S: Fine. G: Tomorrow plan to come at 2100 hours. If you are late, we will wait for you.

134. S: Let me see - (Looking at his schedule) what do you think we should do? What is the program? Tomorrow we visit two firms. G: It is not more than a three-hour drive from London. S: These are refrigeration plants, and CHANNING. G: Here in Birmingham? S: Yes. G: Is this in the morning or afternoon? S: WYNNE and I can do this either way; we can do this first. G: It does not make any difference which way you do it. S: How long does it take to drive to London from here? All: 2½-3 hours. G: Three hours in heavy traffic. S: Alright, we will count on three hours; I don't allow him to go fast. I have to becareful. G: It is about 120 kilometers. S: That's a lot! G: Kilometers! S: Oh! Kilometers. I thought it was miles. Here, a Colonel MACKAY gave me a ride at 110 m.p.h. to Westpool. Let's say nine o'clock tomorrow. G: Fine, let's decide on nine. S: Today I could have come over at eight thirty and sat waiting until nine. G: That is unfortunate. S: I sat and waited. M: Tomorrow this won't happen. You have to go to two places tomorrow and, in addition, drive to London.

135. G:(In English) How about rooming arrangements? Should I tell him that? M: Yes. G: Here is a small but important matter. It has been arranged that you will all be staying on the 6th floor. S: I, also? G: Yes. S: Is it convenient for me to go downstairs? G: Yes, very convenient. S: I won't have to walk along the corridor? G: No. S: I will be in the same wing as you? G: Yes, very close. S. This is very important. M: That's right. He is going to be in room 644. You're in room 360 and that's the same corridor. He will be quite near the back steirs, to come down. All the other people will be in another corridor. S: I don't want to cross thecorridor where my people might stick out their heads, or go to drink beer. I want to step out of my room and dive here. G: Here is your room -- 644. (Subject is shown the location of his room, the stairs, the elevators, etc., on a floor plan of the hotel.) G: All further meeting will take place there -- in room 360 -- tomorrow, day after tomorrow, etc. You will meet the prominent person. Everything will be done. Even WYNNE will be taken care of, but never discuss operational matters with him. The most important thing -- you will go to Moscow; he will bring you things. That is fine as far as you are concerned. He will give you a little note like this. You will give him something and a conspiratorial situation will develop. S: Teach him a little. G: Of course, but you be very careful. If he talks too much or becomes scared, a danger will be created for you.

#7

136. S: You know something interesting! You will be happy to hear about the behavior of MERRIMAN whom I met yesterday and today. Today he gave us a deluxe dinner; I figure he spent 50-60 pounds -- a quart with ZAKUSKI, various wines. There were many people there. The 76-year old director was there, by the name of William COX. S: I gave quite a speech "on behalf of my delegation" but MERRIMAN did not say anything. Everything is going well. G: Yes. S: But he looks like he knows. G: Oh, yes. He is a solid person. S: Maybe he guesses, but basically he is very reliable. S: He didn't say a word, yesterday. We arrived, I had dinner. WINER was not there. I told my delegation "Let's go to the movies". We went to the movies yesterday. Today the cutlery manufacturer gave a dinner. He gave us gifts -- a set of cutlery "of the best steel" for my wife. Everything was nicely presented. All the members of the delegation got gifts -- manicure sets, scissors, knives -- allmade from good steel. Everything was well organized. We looked -- and nothing. Not a word, as though nothing happened. That's the way it should be. G: The cultural way!

137 G: We are sitting here in England. We can joke, but under no circumstances should you make any mistakes in Moscow. For example, let's say WINER becomes scared and they break him -- because of some little thing that should not have happened. S: He should be warned! G: How can you warn him? S: It can be a provocation. G: But a person like that can be made to break, you understand, since he is inexperienced. You should act in a careful manner so as not to bring this on. Do what can be done; don't do what should not be done. Here you can run around (together), joke, buy things (for each other), treat (each other) etc. This is one thing. In Moscow, you will do the official entertaining. When it concerns conspiratorial matters, and one is inexperienced, he cannot be taught in five minutes. You, thank God, have had experience all your life. S: I understand. G: This is a dangerous thing. S: You will warn and prepare him.

138 S: Will you listen to me? You are not too tired? G: No. S: I am not tired yet. Let's work some more. Look here, I have some material ready that I can give to you in a hurry. Three journals, Military Thought (Voennaya Mysl) -- one of the issues has a very well done, interesting article by VASILEVSKY. The following is written on it, "Only for Officers, Generals and Admirals". G: What size are they? S: Like this (about 9" x 12"). G: A package like this? S: I was afraid to take it; it is large. G: Yes.

139. S: Let me tell you about SUSLIN. He is being assigned to Turkey as a Counselor but will really establish an illegal RESIDENTURA there. He is small 5'6", wears glasses, is practically bald, and his few dark hairs are greying. He has gold teeth, a red nose, a wide mouth and he is chunky. He graduated from the MGIMO in 1951 or 1952. He was always friendly to me. At one time before his being sent to Turkey was fixed, he sent for me. He is a fine fellow; treats me very well; and tells me many things, which I really have no business knowing. In other words, he trusts me.

#7

140. S: When he found out about what I could get done concretely, from ZASOKIN's example -- I helped him (ZASOKIN) twice, with Agrelovka and also Rabushkins housing -- ... So, I went to the office of the Chief of the Directorate -- and there was the office of GUDIN. There is a hall -- the fifth floor -- here is ZASOKIN -- here was (Subject's true name)'s office. GUDIN said to me, "Do me a favor. Prepare a paper for me as if for a Delegate of the Supreme Soviet. I can't breathe without a telephone". Really! He's a Deputy to the Chief of a Directorate and he has no phone to receive calls on. There's really no possibility of putting one in -- either the lines are overloaded there or they have not been run up to the new houses. He lives in an old house, right across the street from me in General Major KHALIPOV's apartment. KHALIPOV, a political worker in PVO, moved to the next house, to a larger apartment. When they fire KHALIPOV, they'll tell him the apartment is too large for him. That's the system!

141. G: What does KAPALKIN do now? S: The General is retired. He does nothing -- drinks Vodka and plays cards. The tall one -- a good-looking man, Sergei (Seriozha) used to work in the Council of Ministers. There was a group there before, in BULGANIN's time, and he worked there coordinating such matters on Intelligence which were of Government interest. He was not the chief of a section; the chief of the section was an Intelligence Officer, a General, and he works in Information Directorate now -- like VISSOTSKIY, the Chief of a Direction.

142. G: BERZLIN? S: No, not BERZIN. G: BERZIN was Chief of a Direction. S: There he was; so were other Generals. G: The devil take them! They change them so often. S: He only became General recently; he was a Colonel. I took an examination under him.

143. G: VASIL'EV? S: No, we'll leave it for a while -- maybe the name will come to me. KAPALKIN, then, worked in BULGANIN's group. Then they liquidated BULGANIN and dispersed the group and KAPALKIN was thrown out, together with this General and one other man. There were three from GRU. KAPALKIN was given the post of Chief of a Direction, with your friend BERZHKOV. Then he had an argument with BERZHKOV. This is a very difficult man -- he recently dismissed Colonel IVANOV, the one who was a RESIDENT in Istanbul when I was there in 1955-1956 - the one who went to France. G: PROKHOROV? S: PROKHOROV. When I was leaving the Academy, turning over the course, KAPALKIN was called by GRIBKHEV. Now he works in this school for Illegals. This school was under BERZIN, the one who is now the military attache in Japan. G: Together with MEDVEDEV and all that bunch? S: That's right. I remember his wife used to wear her hair piled up high on her head. G: What is his brother doing? Vladimir (KAPALKIN). S: I really don't know anything about Volodya.

144. S: Let me tell you a story. KUKOV's son studied with me - Gelly. His father is Ivan, so he is Gelly Ivanovich. He was tall, liked women a good deal, was an avid motorcyclist and bet on horses. He was really living it up. In 1949, he graduated from the Institute of Foreign Languages. This is the same Institute which is now being combined with the Academy. That year, I entered the Academy and he entered it. Here we were, going to school together! (Tape not clear -- something about his having an accident on his motorcycle, and Subject's concern that someone had been killed.) I said to KHLEBOV, the Chief of the course, "KUKOV is behaving like a hooligan!" G: When was this? When you were attending FRUNZE? S: No, it was at the MDA in 1949. G: So he (KUKOV, Gelly) went to the MD Academy? S: He graduated -- he has the button -- but he is never allowed abroad because he is the son of a Marshal. In the USSR, all the sons of Marshals have graduated from the Academy -- SHAPOSHNIKOV graduated; KUKOV graduated, SEMASTOKHOVSKIY's son graduated. They all find some sort of job but they are not allowed abroad. They are trying to be sent abroad. G: What year was this, about KUKOV? S: In 1949. I was the senior student in charge (STARSHINA KURSA). He graduated in 1953; now he is a Captain. He entered the Academy as a Lieutenant; he graduated as a Senior Lieutenant ; now he is a Captain. He's always walking around with a puffy face; visits the restaurants daily. He's really living it up.

145. S: Had you heard that SOKOLOVSKIY's son has been sentenced to 25 years? G: No! S: A gang of these sons and daughters of the Marshals got together at a summer cottage (DACHA), and raped a young girl who came for a vacation from Leningrad to Moscow. She is the niece of some Minister. I don't remember either the Ministry or the name now. When she was trying to fight them off in the car -- they were taking her some place through the Belorusskiy Station and were all drunk -- the car was weaving this way and that way and a policeman noticed it and stopped the traffic. One of them drew a revolver and fired a blank -- because he was drunk. Nevertheless, the car was detained and they were tried. STALIN said (This was still in STALIN's time) "Putting aside all ranks -- even though I have great respect for SOKILOVSKIY -- we will have a trial". And they were tried. Of course he was arrested and worked his time. Then he went to the University in the Lenin Hills. Altogether, he was imprisoned about three years. Then he developed ulcers and was quickly set free. This son of KUKOV is in the same type of crowd.

146. S: Now he is working in the Directorate of Information. He works in the American Section, by the way, and knows English very well. That's Gelia -- Gelly Ivanovich. His father, the Marshal, was the Commander-in-Chief of the First Ukrainian Front. After the war was over, he left Gelly's mother

(his first wife who had borne him Celiy and a daughter Irena). The daughter, Irena, is now married and has children. Anyway, he left them and married the manageress/directress of the cafeteria (STOLOVAYA) of the Military Council of the First Ukrainian Front. He is still living with her and now has a little child from this manageress/directress of the STOLOVAYA.

147 G: Do you remember a VASIL'EV at the Academy? S: Our Academy? G: Yes. Vasiliy Nikolayevich VASIL'EV, a Colonel. He is bald. His alias (KLICHKA) was PETROV. S: There was a VASIL'EV. The name is passing through my brain. I've told you my alias, haven't I? OLKHOV? J: It is -- after one o'clock. S: Alright. Tomorrow we meet at 9 o'clock, right? (Subject reviews a list of purchases he is to make for his wife.) S: A between-season coat, red with white buttons. They take advantage of me. She likes to dress well and, of course, I spoil her. I'm going to such a "wealthy" country - what am I going to do, bring her a little blouse? I'm going to have to scurry around and look. My progress is here, I've given you all the papers. Right? So, tomorrow at 9 -- no earlier? J: It can be earlier. G: Let's say 8:30. S: You'll be there by 8:30? G: Yes! S: Well, alright then. Tomorrow, we'll work some more. Goodnight -- until tomorrow... (Subject left at 0105 hours on 26 April 1961.)

(16)

Meeting No. 10 at London, England, 30 April 1961

Subject arrived at 2005 hours on Sunday, 30 April 1961. After greeting Subject, he sat down and said--

(1) S: Today we went sightseeing. We saw Windsor Castle. I have some questions to ask you. Let us assume that I arrive in Moscow on 6 May. Let us assume that I have arrived with no incident, and in any case you will give me a telephone no. to call in Moscow, I will ring it at a designated hour and just let the phone ring--say 3 times--and engage in no conversation. This would signify that all is in order. In a minute I will make 3 rings again and that is all. I will call from an outside booth. If I make more rings than 3 that will signify that something is not in order and I will attempt to advise you in some other way as I can. Possibly surveillance on me of some sort - as an example. G: Translates above into English. S: I can call up at any time in the evening from a phone booth. G: Prior to your departure we will provide you with the number and tell you when to call. S: I should think that you would want to know that all is well with me. G: Of course, we would. S: Things could be worked out simply: If I did not get every thing from you prior to my departure or if WYNNE couldn't bring it. Anyone speaking Russian, man or woman, could call me from a phone booth and say anything irrelevant. G: Yes, but the point is that we do not wish to cut in unnecessary people to have knowledge of you. S: I understand this and am grateful to you for this. That is proper.

2. Please consider the two places I gave you. One, the dead drop site and the other, the meeting site. It is very good to meet on this NABEREZHNAYA near the TRETYAKOVSKAYA Gallery. I know every nook there and even the women custodians. Those Americans acted very well. When we were talking in Russian and occasional passers-by came near, mostly women, they cleverly changed the conversation, admiring the moon, etc.

(3) S: My second question: I am trying to find out a way to contact [redacted]. Thus far I simply have had no chance. Can you help me in this? Tomorrow, I have an appointment at the Soviet Embassy and will probably meet the RESIDENT for a short time. I'll also have a drink or two with SHAPOVALOV. I need basic personal data on [redacted]. There was no opportunity for me to get this in Moscow. G: You mean data as evidence that

APPROVED FOR RELEASE
31 MAR 1992

[redacted]

[redacted]

you have studied the man. S: Yes, I need only a little, not much. G: You know, just looking at his visiting card. All sorts of titles, decoration, etc. are listed on it, and you need to report such data as if you got it yourself. S: Yes, that's all and some basic biographic data, date of birth, marital status, children, address, telephone number.

(4) S: Tomorrow morning I will not go with the delegation. They know I have to go to the Embassy to arrange for money allowances and make all other arrangements for our extended stay. I'll not go there until 1100 hours. In the morning will go to stores with WYNNE. My delegation members are all very happy. They will be able to buy all sorts of junk with the money they saved on their per diem since they were fed everywhere. I'll meet them at 1500 to 1600 hours. They are happy with me since they feel I have organized everything well for them personally. There hasn't been one word of criticizing to date. I even told them that if they write good reports on their work here and do good work they will come here with me again in October. This is very attractive to them. I told them I would also write a favorable report and they are all happy.

5. S: I need this material on MERRIMAN - just brief information. G: Very well, when can you drop in tomorrow morning? S: I am going to the stores with WYNNE. Yesterday we already made the arrangements. I will leave my purchases with him and what he can't bring to me on his coming trip he can bring me later, in 2 or 3 months. However, I want to purchase everything myself since I have a whole notebook full of items to get. This will take me 2 or 3 days. Then I will go to the Embassy to receive funds. The approving cable has come in as well as cable approving funds less 40 pounds; they are economizing. The outgoing cable was well worded. It stated that the delegation will look into electronics, and the approval went through the Central Committee.

(6) S: They want to learn about every little electronic detail. I have seen many reports made by visiting delegations. Copies are duplicated for dissemination to the various inst'tutes and academies. I will get you copies from the originals and your scientists can see what our delegates are after and what they get. Your people are not shown our factories of significance. Only certain ones are offered for inspection. We were supposed to take [redacted] to see a cement factory. At

[redacted]

first they said, only the electric train can be used not the highway, since too many PVO installations can be seen from the highway. Later they cancelled the trip saying the area is too muddy in Winter. They show very little or things of little value. Why do you not restrict our delegations? Of course, not the ones which I lead. (Laughter) Seriously, you should restrict this, the Americans are already doing this on a reciprocal basis only. On the 9th of May a seven-man delegation on hoisting and transport equipment is coming here. SCHWARTZ will be the interpreter who is co-opted by KGB. He is on our Committee and is a half Jew. There will be a conference here and they will be received by BERGER who operates like WYNNE, and goes to Moscow often. This delegation has been given numerous specific missions and the personnel come from interested industries. The GNTK conducts the negotiations and is the instrument for effecting scientific intelligence. They got 22 patents for synthetic rubber from Canada. This is vital for war material. KHRUSHCHEV has understood this and has made a powerful committee of the GNTK.

7. H: Who is the GNTK subordinated to? G: We would like to ask you about the GNTK, but first of all - excuse me - tell me when can you drop in, tomorrow? You see we have to contact MERRIMAN because he may be out of town and you will not be able to reach him. S: Then it can be the day after tomorrow. G: That is all well and good but it is necessary to determine when he will be available. S: What I need, from MERRIMAN, is to speak to him. Of course, we have trouble understanding each other. All I need is to speak to him for 5 minutes, then I will go to the Embassy and pass them the basic data on him. I believe they may even assign the man who is returning, PAVLOV, to contact MERRIMAN. Or they may assign GENERALOV. I have not met him yet, but he is a case officer working in the technical group. The group consists of three: PAVLOV, SHAPOVALOV and GENERALOV. G: We will get this information on Merriman for you. S: I can then simply introduce him on the 4th or 5th of May. G: At this introductory meeting, MERRIMAN can give you some materials and promise to deliver the rest to you via the case officer you have just introduced. S: That's right, just half the material and promise to deliver the balance later. The contact will drag on for several months. When I told SHAPOVALOV how old MERRIMAN was, he said that we don't work with old men as agents. The requirement here is that the contact be a resident of London, a British citizen and younger. The old man would not be recruited, but treated as a trusted informant.

[redacted]

[redacted]

8. S: Now about the newly organized committee. KHRUNICHEV, a deputy of KHRUSHCHEV and a minister of USSR has more stature than PETUKOV, the former chief. KHRUNICHEV has 5 deputies and he has the Committee under his control. The Committee is like Soviet of Scientists like a Praesidium. There are about 15 Committee members. These will include chief specialists, chiefs of directorates. This is the top echelon. Thus he has under him the Directorate of Foreign Relations, the Chief of which is GVISHIANI -- who remains as chief. If they made me his deputy, then I would have greater freedom of action since I could attend meetings, receptions, etc. to all countries not only those I have to do with now. G: This is a Directorate? S: It will be by the new Table of Organization. It is now an OTDEL. The Directorate (Upravieniye) has three OTDELS: The OTDEL of Foreign Relations; the Information OTDEL and the Foreign OTDEL, like a Protocol OTDEL. G: What do these do?

9. S: The OTDEL of Foreign Relations consists of sectors such as the American Sector which includes all American Countries (NORSO); the English sector, under BERDENIKOV, which includes Canada and Dominions; the third is the Africa-Asian sector including the Near, Middle and Far East. Each OTDEL has a chief inspector and an expert who is in charge of one or two countries - thus each sector would have 12-15 experts. Lt. Col. TRAVKIN, who worked in the UN in New York, is a Strategic Intelligence officer. He was there six months and was removed, that is normally, and he was appointed as an expert in the American sector. He is subordinate to the Sector Chief, Denis POLYAKOV. I graduated from the Academy with POLYAKOV and he had been in America with a delegation just as I am here now. One by one, I am remembering my classmates. Originally there were 100 but 2 were dismissed. One had a father who was a KULAK and the other was dismissed for some reason that I can't remember. I may be in a similar situation now but they must suffer me there or shoot me, one of the two.

10. G: You say that you expect to be the Deputy of the Directorate? S: Yes, if nothing happens, the Deputy to GVISHIANI. His full name is Pchernen NIKHAILOVICH and his is married to the daughter of KOSYGIN. He is a member of the Committee and is not a stupid man; he is well liked, and he is very pleasant to me

[redacted]

He is a Georgian. Of course, he is also feared because of his father-in-law. One complaint to him and the man is gone.

11. G: How about theother OTDELS? S: The Information OTDEL has in it 15 chief specialists. These specialists are experts in their industrial fields such as electric power, black metalurgy, electrical equipment, steel, etc., in short, all of the main industries. But of these, the most authoritative specialists are also members of the Committee. Whenever delegations bring in material, it is turned over to the Information OTDEL and the specialists will determine where it should be sent. For example, to a specific industry if it is needed at once; to an institute or academy, or to a ministry. They also evaluate the material. G: Do they also have military specialists? S: Yes. These who are concerned with war production. All our people are civilians but they coordinate their work with the military.

12. S: The Foreign OTDEL consists of the Protocol Sector which deals with the reception of foreigners and are agents for their accommodations, etc. Prominent visiters are often granted all accommodations at government expense. Another sector plans the tours for visiting delegations; determines who will accompany the foreign delegations and sets up conferences. Then they determine who will attend the return invitations to the various embassies. These sectors are really called working groups in this OTDEL. Two or three people do the planning for tours; they call the chiefs of industries where visiting delegations would like to go and get permission to visit whatever is permitted. Another group arranges for the guides and interpreters. A third group takes care of protocol for conferences, etc. In short, all of the personnel in this Foreign OTDEL service foreign delegations. Each area sector is represented by a group which accompanies foreigners from these countries. G: What is the total personnel strength? S: I can tell you exactly. There are twenty persons in this OTDEL in which there are three groups and each group has five officers not counting the chiefs.

13. S: In the future, the Information OTDEL will also be a group of OTDELS headed by our specialists to whom all materials will be given for evaluation and who will give directives for matters of scientific interest according to orders from KHRUNICHEV and the higher committee. They also will evaluate the materials received and pass them on as directed.

14. J: (In English) Something is not clear to me. I have seen American delegations go to the USSR. For example, agricultural delegations -- and they dealt directly with the Minister of Agriculture. S: But now they will go through us. Our specialist on agriculture will arrange for all the visits to Kolkhozes and arrange all conferences. For example, on the 12th of May the Ontario Province agricultural chief, Mr. SPOONER, will arrive. Prior to my coming here I gave instructions to the Protocol OTDEL, specifically to ULYANENKO who had been here before. Everything goes through us but we order the foreign section of the Ministry of Agriculture to prepare an itinerary to visit forestry research centers for the things SPOONER is interested in, i.e., forest fire protection, insect control and fisheries. We do not order these sub-sections of Agriculture but deal through the Minister of Agriculture, which has its own foreign section.

15. J: Does this include the pure sciences and the Academy of Science? S: The Academy of Sciences has all kinds of comparable activity, but we coordinate everything. They will also examine materials obtained from you and will resolve contradictions and determine where prime interests lie.

16. G: What is the overall strength of your OTDEL? The OTDEL of Foreign Relations. S: Now we have seventy persons, but in the future we will have between 120 and 130. G: Are you speaking of the Directorate of Foreign Relations or just of your Foreign Relations OTDEL? S: I misunderstood. The Foreign Protocol OTDEL has twenty; then the Information OTDEL has, in addition to the fifty specialists, about twenty-five REFERENTY. This may include some stenographers. The largest OTDEL is our OTDEL of Foreign Relations, so there would be

about sixty there. About ten of these would be chiefs of working groups and deputies and about fifty workers. A group of 3 or 4 of these may be cadre personnel who maintain liaison with our Ministry of Foreign Affairs. In addition, there will be a group of about 5 persons, now there are only 2, who will project plans for our visiting delegations. They maintain liaison with the Soviet Travel Commission of the Central Committee. First of all, they consult with us and ask which individual members of a proposed delegation we recommend on a quarterly basis.

17. S: For example, I planned two delegations for Canada this Spring. This is submitted to this group which reports to the Central Committee. For example, we have planned to send 22 delegations in the first quarter. Of these, 2 are to go to Canada, so many to England, etc. At the same time, we already have tentative plans for delegations to be sent during the other 3 quarters of the year. All this is submitted to the Central Committee for analysis and in the proposed delegation are included KGB officers and GRU officers, but if the delegation issmall and only a few specialists can go, then there will be coopted specialists of GRU and KGB or both. This group is really an OTDELENIYE. All of this is, first of all, based on the scientific intelligence mission plan. Specific items of information are then set forth as missions for selected specialists but, of course, this is to supplement intelligence obtained through agents since delegations cannot answer all questions of interest.

18. G: Since this group is also under GVISHIANI, is it correct to say that the Directorate consists of three OTDELS and this planning OTDELENIYE? S: Yes. This Planning OTDELENIYE or Group is also called the Planning Center and they sit in a room all by themselves and select members of our delegations by name.

19. H: How is this coordinated with the agent work? S: After the name is submitted to the Central Committee Exit Commission and they check him out completely through KGB and Party records, and grant him permission to go abroad, if we as GRU have specific intelligence information which we want the delegation member to obtain, he will be called directly

into GRU Headquarters and be given a mission briefing. When he enters the mission, which we always call the Scientific-Military Mission, he then signs a secrecy agreement under penalty of punishment. This man would now be called a specialist coopted by GRU.

Talent spotting for specialists as "illegals" for scientific intelligence

20. S: I, myself, and others like me in the Committee, also have a mission of spotting young, promising scientists in civilian status who could be used as illegals by BEKRENEV. He would have to be a specialist, however, and this is an indication of how intensively they are stressing scientific intelligence. Thus far we have not found even one such specialist. At least not since I've been with the Committee, but we are still looking. Should we find an acceptable person, he then would be taken for illegals training and this is, from their viewpoint, a desirable thing since after all in the GRU we do not train specialists or scientists.

KGB 2/MP Sup's Y.I. LEVIN →

21. G: What does the KGB do? S: They do exactly the same thing. G: What are the functions of the KGB personnel who are directly assigned to your Committee? S: The Chief of the KGB group there is LETIN, who is a colonel, just as I am. His Deputy is a lieutenant colonel, whose name I don't recall, and he also sits in the same OTDEL where I do. They have a total of about 15 people in the Committee and, in addition, they have about 20 KGB coopted persons.

Security external & training abroad

22 G: Do they report on the others? S: Absolutely. The coopted ones are all conformists who will report if anything is said against KHRUSHCHEV. I cannot go to a reception without one of them accompanying me. This KGB officer will watch me but he will do stupid things a hundred fold more than I will. He will get drunk and he will behave in a non-KULTURNA manner. He will still report on me, however, even if he doesn't know the local language. G: In addition to this do they not have intelligence missions? S: Of course they do. And I believe that this man who came with me, LOPATO, is a coopted KGB worker. Their mission is primarily political intelligence, although they do have secondary missions of general intelligence and, of course, they report on all others of the Soviet delegation. For example, last December when I invited Wynne to a reception, I also invited some of our specialists. Since the food and drink were free, they got

[redacted]

drunk. The KGB report said that these specialists should not be invited again since they don't know how to behave before foreigners.

23. J: There is a State Committee for Defense Technology. What is the relationship between that committee and your committee? S: Absolutely right, there is such a committee. And it is under the Council of Ministers -- entirely separate. J: There is also a Committee for Radio Electronics. S: These committees are purely scientific, and they contact us for information in their fields. They may provide one of their members for inclusion in one of our delegations. They give us this man for training to obtain intelligence information desired by the committee. The committee itself consists of very highly trained and trusted individuals but we handle their intelligence requirements for them. Our efforts are saving the Soviet Union much money and are giving them very valuable information. I would suggest that your big people consider this problem. I realize that it is not possible to cut off all delegations, since they fit into the scheme of things of diplomatic relations and politics, but ways should be revised for making our visiting delegations ineffectual. That is by systematically limiting them to very ineccuous information.

24. S: Now I will send you an organizational chart of the GNTK and a classified telephone directory, which I can get with ease. There you will find the full name and telephone number of all the members. In addition, I have locked up in the right-hand drawer of my desk reports of all my agent material. I would have brought it this time in my suitcase but I was afraid to do this. I knew it would not fit into my pocket. I wouldn't like to trust it to a suitcase and, though they would never search unless I was under suspicion, it is possible that they may request to see the contents of my suitcase. Although to date, that has not been done, since they knew that I am a colonel. If they ever did I'd have to run to one embassy or the other, I don't know which one. (Jokingly) G: I would suggest you run to the nearest one. (Jokingly) S: It irritated me to realize that I live on

[redacted]

[redacted]

the same street where the British Embassy is located, and that I sat across from the U.S. Embassy, and nobody would walk out to whom I could give my material.

25. G: Chalk off your notes, you will receive a telephone number to call upon your arrival in Moscow and we will set a proper time. S: Presumably you will give me all kinds of instructions and requests before I leave. G: Of course we will. S: I could very easily make a phone call after I arrive. I'll walk out to get a glass of beer and go to a phone booth. Then you will not worry if all is well or not. Regarding Merriman, I will drop in tomorrow. G: What time will you come? S: Let me figure it out; I will tell you before I leave tonight. I could even arrange it that if later someone would call Merriman in my name that would be sufficient to receive materials which I have arranged for. G: It would be better if you had introduced him personally. S: Of course it would. I only suggest this other means as a variant. G: Have you studied your one-time pads yet and instructions for coding by numbers? S: Yes, but we shall review this again. H: Let us do the small things now because the doctor will be here in 15 minutes. (G translates.)

26. S: Please explain to me the signal plan procedure for radio transmission. Why is the number repeated again after the first transmission? G: That is an order to repeat the entire message the second time and to indicate to you that it is the second transmission. S: Oh, I see; I did not understand that yesterday. When the instructor comes again and brings the one-time pads which I requested, I'd like to review the procedures of which groups come first. G: As soon as the larger pads are obtained, I will show you this. It is very simple. (G illustrates to Subject how the book indicator and the line indicator is used. Subject understood.)

27. S: I have written out certain questions for the doctor about medicine that I have to bring back. These are not for me. Is it alright to give them to him since I wrote them in my own hand? G: We will translate it all. S: Is it alright that I took my own photograph with the Minox while I was practicing? G: Of course, it is. The photographer is our own man and we have the negative. S: I was worried. G: Well, I'm trying to reassure you that there is nothing to fear from that direction.

[redacted]

28. S: When I was leaving to come here, the Chief of the Personnel Section of the GNTK asked me to bring back the following medicine for him: It is called cripaneza in ampules. It is a medication inthe treatment for cancer. Some one of his relatives needs this. We can get it in the USSR but with great difficulty and it is said to be very effective. G: What quantities do you need? S: Just a small quantity. It is used as an injection. Another man asked me to get tablets to restore vitality. I also need a medicine for relief of kidney stone pains. G: This should be simple; what type of trouble. Is it stone or infection? S: It's for stones and it is called Reeatinex. It is manufactured in West Germany. We get it in small quantities in the USSR. S: The Chief of the Protocol Sector of our committee is suffering from headache spasms. He used to work for MOLOTOV at one time. He requests hydrocortecone. This is for exzema. There are some tablets one takes for this. Also there are salves.

29. S: Now for myself -- I need some effective salve for conjnctivitis. This may be in liquid form or a salve. The doctor can look at me and see what I need. My eye sight is perfect but I get this red inflammation which I picked up in Turkey. I also need some dental plastic plates. When I was wounded, my jawbone broke, andhere I have some plastic teeth which have broken. If I could get a dental plastic plate to match the color of my teeth, I have an excellent dentist in Moscow who can replace the broken pieces. G: In other words, you need the material to match your teeth and your dentist will do the work? S: That's right. G: Do you knew the kind of dental material. Is it acryllic? S: I don't know. What my dentist said was that there is a set of plates in a box and when the proper color is matched from these the proper teeth shape is stamped out and that is all there is to it. One more small favor -- I need a supply of these little chocolates. G: That is very simple. That is only Ex-Lax. S: Yes, but we have much difficulty getting it in the USSR. This is what I request. G: We'll get it for you. The doctor will write out a prescription for whatever can be obtained directly. S: But I can't get a prescription myself. G: We will get it for you.

S: This is my entire medical list. We have all of these things from time to time in the USSR but they are hard to get. Anyway this is what I've written out for the docter. Sergey SERGEYEVICH (VARENTSOV) asked me to get him the vitality pills. I also have to get a light filter and a hood for a Leica. You don't know how it is. When they know you are going abroad, everyone asks for a particular item. So I am honestly telling you what they requested me to do and I ask you to help me. H: Very well, we will get it for you.

30. S: I would like to express my sincere appreciation for the way you have supported Wynne materially. Yesterday, he mentioned it to me and appeared to be very very pleased. I thank you for this and it indicates to me that you value me highly for having done this. I can't imagine saying farewell to you and not meeting again with you inthe near future. Possibly I'll fly to Canada and you will meet me there, or in Canberra in Australia. I know what to do now. I will send back with Wynne the material that I have and I will be able to photograph many documents and manuals with the Minox. Then your people will have no doubts about me whatsoever. If only Wynne will make no mistake. G: Don't worry about him. He will pass the material to the Embassy at once and it will be in safe hands. But we want to advise you not to take needless chances and if you see that it is too risky to get complete material, take only what is safe to get and let the rest go. Your personal security is of greater value to us than every last bit of information. We are not greedy for intelligence if it involves unnecessary personal risk for you. S: Thank you for that and if I do my work in an outstanding fashion and Wynne fulfills his part, will you give him a decoration? G: That is possible but that would be determined after he has accomplished his work. We don't promise one something prior to his having done it. S: He looked very pleased yesterday. He is making a small addition to his office. It's very neat and modest but he doesn't even have money to finish it. He has a neat place but lives on a modest scale; his wife is also modest. Yesterday they took me out to three clubs and then she prepared a very fine dinner and we had lots of toasts. G: Where do you get all this energy and at the same time no sleep? S: I even

[redacted]

danced yesterday but then I relaxed and had a fine dinner. When I saw what was served I couldn't help but think how impossible it is to get these things in the USSR. Even tomatoes are extremely expensive. Everything there is built on a pack of lies and the people are surpressed by a powerful force which is nothing but demagoguery. If we had a democracy an opposition party would develop at once but it is a police state and when MOLOTOV, who was supported by a number of intelligent people, said something against the regime they were all squeezed out at once and they were not far from being shot. Although these days that is not done, as it had been before. G: The doctor will arrive in a few minutes. S: SHÉPILOV was a very intelligent man.

31. G: Since you mentioned him, a very important question comes to mind. Tell me, in analyzing intelligence missions on a world-wide scale, with respect to GRU and KGB, at what level are the missions brought together for analysis and assignment? Where is the level and who participates in determining the assignment of missions; the review of mission progress periodically; the assignment of personnel of GRU and KGB according to priorities? S: It's like this -- KGB does not know about our agent nets and we do not know about theirs. All information obtained from clandestine sources goes forward to the appropriate interested committee of the Central Committee of the Communist Party -- That is matters dealing with specific industries, war production, etc. Political information goes to the Political Committee of the Central Committee. The overall Central Committee is an enormous organization. They decide everything since they control the entire industrial structure of the USSR. All decisions are made by them and by the Praesidium.

32. G: Is there a committee called the Coordinating Committee for Intelligence Activities? S: No, not as such, but since the individual committees of the Central Committee are the brains for each particular field of interest. They decide what missions should be assigned to the GRU and which to the KGB and in case of a dispute between the GRU and KGB

[redacted]

regarding slots, the Central Committee makes the decision. The Central Committee has a louder voice than KGB and KHRUSHCHEV had reorganized the KGB as a Committee to keep closer control of the KGB under himself. Previously under BERIA many matters were held up by the KGB without the knowledge of the Central Committee.

33. Q: Let us take an example -- assume that in London the GRU REZIDENTURA has 20 men and the KGB has 15; who had determined this allocation of slots as well as the specific covers given to each? S: The Central Committee determined this and the slots were provided by the Ministry of Foreign Affairs as directed by the Central Committee. Everything is done by the Central Committee; for example, when McClellan was to come and they wanted to allot say 3,000 rubles for his expenses including automobiles, etc., the Central Committee decided this. If SEROV wanted a slot of counseller in some embassy for a GRU officer, he would request the Central Committee to instruct the Ministry of Foreign Affairs to provide this. The Central Committee is enormous; there are 5,000-6,000 people there.

34.G:Who does the Central Committee call for consultation on such matters, the Directorate chief or NAPRAVLENIYE chief? S: No, here's how it works. The Central Committee workers concerned with the GRU come directly to the GRU headquarters. These are not the chiefs in the Central Committee offices but they are called instructors. Remember that the instructors, however, from the Central Committee enjoy the privileges and power of a regional committee member of the Communist Party. They have vehicles, DACHAS, and all kinds of fancy food allotments. They have tremendous stature due to their Party position. The word of such an instructor is everything for even a minister. It is law. Since the instructor represents the opinion of the Central Committee. This is particularly true for ministers who are straight government people and not members of the Central Committee themselves. SEROV cannot demand three counseller slots; he must submit his request to the Central Committee who will make the decision.

35. H: How do they trace agents? S: If a prospective agent is contemplated by the GRU, they check his name with the KGB. If there is a prior KGB interest, the KGB simply states that there is a prior interest in him and to break off contact. G: Do they check their prospects with you? S: No, because they know if we have an interest or not since we have always checked our agents with them earlier. If we have an agent and they approach him then we may send a report of complaint based on our priority.

36. (The phone rings and the doctor who has entered the lobby is being met by agent.) (Subject speaks about his heart and G reassures him to tell the doctor all his symptoms and he will have his examination. There is no security problem since the doctor belongs to the intelligence service. While waiting for the doctor, Subject speaks further on the topic above.)

37. S: All name traces are conducted in Moscow by the KGB. Remember that all intelligence personnel, whether they are GRU or KGB, attempt to get all of the information, as well as recruits, that they can. They have one common mission and that is to determine as soon as possible any indications on the part of a potential hostile country of any preparations for hostilities. This includes, of course, troop movements, redeployment of troops, etc. Conversely, this is now my mission with respect to you. I will advise you any way I can of any impending moves which may indicate hostile intentions. I think we'll be able to do a great deal for you in the future. G: We will go slowly and you work over a long period of time but when the time comes for you to move out, we will consult with you on preliminary measures to get your family into a position from which they can escape easily. For example, if they could get to the DDR and visit

East Berlin it would be simple to cross to West Berlin by subway. But, of course, with no suitcases, since the East German police could stop anyone with a suitcase. That is just one means and we will figure out others as time goes on. S: In case of hostilities, I would like to know several months beforehand so I could move my family out of the area where the Moscow Military District Headquarters is, and would be blown up.

38. (At this moment the doctor entered and was introduced to Subject.) H to Dr: I shall leave you for a short while to George and the patient. Dr: First of all, I'd like to ask him a few questions. G: He mentioned two particular things that he is concerned about. One was a question of getting a dental plate for his teeth. He was wounded during the war and needs some teeth to replace the broken ones on his prosthetic. Dr: Fine, we can get together on that later. G: The other matter is that he thinks he has conjunctivitus. Dr: How old are you? (G translates all questions.) S: 42. Dr: Did you have any serious illnesses since you were 4 years old? S: Pneumonia at 10 years old. Dr: Since then? S: No, Dr: What else? S: Mumps, I never had typus or anything else. Dr: Any operations? S: Only on the jaw and nose after being wounded. I was also shell-shocked. Dr: Any nervous illnesses? S: I am nervous by nature but not as an illness. I have had angina, but since my tonsils were removed 8 years ago I have not had it any more. (Further medical data as follows: 6 teeth lost after being wounded in jaw; had carbuncle removed. Has carbuncle on arm which Soviet medics attribute to malnutrition in youth. Smokes rarely; does not inhale. Drinks normally, not to excess. Mother is alive; father killed in revolution. Both were healthy. Is married. Wife healthy; daughter 15, healthy. No symptoms at the moment; occasionally has slight spasms of heart, (showing left side of chest, not where heart is), which Soviet doctors told him were early symptoms of arterial sclerosis. The spasms began irregularly since the war -- for 15 years. Spasms begin when highly tense nervously. Has good appetite, no indigestion, sleeps well. No shortness of breath.) S: My only trouble now is the redness in my eyes. I contracted this 5 or 6 years ago when I was in Turkey. It comes and goes. Lack of sleep aggrevates it. (Dr. examines his eyes.) Dr: That is all I need for questions. Now I'd like to examine him.

39. (Subject was asked to disrobe to his underwear and to lay down on the bed for examination. While Subject was disrobing, the doctor was shown the list of medicines requested by Subject for others and the list of alleged purposes the medicines were requested for. Subject was very thoroughly examined by the doctor primarily for any symptoms of heart trouble. Blood pressure was taken and stethoscopic examination

[redacted]

[redacted]

#10

made. With the lights out, Subject's pupils were examined with an eye instrument.) S: (Returning after dressing himself again) Thank you very much for your attention to me. Dr: Will you explain these requests for medicines which I see on this chart (prepared by H). G: These are the medicines requested and these are the reasons given. Dr: I'll check on this TRIPANOZA. It may be an Italian preparation. I doubt if it is made in England or the USA. I'll check on this but it may take time to order it. G: The next item is ROVATINEX for kidney stones. This is a West German preparation. Dr: We will try to get these two medicines but it may be difficult. G: The next one is Hydro-Cortesone 2½%, a salve, for exzema. Dr: Yes, I can get that. No trouble. This is for external use. G: He asks if there is any medicine that can be taken internally, as drops, for exzema. Dr: This cannot be taken internally for exzema but I will get some tranquilizer pills to reduce nervous tension which he says produces the exzema and then applying the salve may alleviate it. I'll also get him an eye salve which may not cure his condition completely but will alleviate it and in time it may go away completely. I'll have to see a dentist about the dental material he requests.

40. Dr: So far as my examination can tell, tell him this. He definitely has no arterial sclerosis and whatever doctors told him that he did were very nasty. First of all, since he felt his spasms on the left 15 years ago, he would have been only 27 years of age at that time. Arterial sclerosis never starts at such an early age and he certainly shows no signs of it now. Secondly, I looked into his eyes, not only to examine the redness which is completely external and which will go away in time, but there is no sign of blood disturbance in the retina of his eyes which is a strong indicator. In general, his blood pressure, pulse and everything else is entirely normal. Thirdly, for his information, his heart is not where he thinks it is. It is right in the middle, not on the left. The spasm he feels when nervous are not abnormal. Other persons feel reactions from nervous stress in the form of headaches or indigestion. He feels a nervous spasm or twitch on his left side. That is all normal. I'll have a report on the urinalysis later but everything looks quite normal to me. Subject thanked doctor for his attention and H escorted the doctor out.

[redacted]

41. S: Well, I guess we should get back to work. G: I'd like you to look at some pictures of rockets taken from the parade a year ago. But I'd like to wait for H to return. S: You understand everything about the work of my committee then? G: Yes, S: You should gradually restrict the activities of our delegation. G: Let us start from this very important question. What did VARENTSOV say on the subject of ICBMs after KHRUSHCHEV made the statement that you had all kinds of ICBMs in readiness? J: This is a very important question. That is why we are going over it again. S: The basic idea of this on the part of KHRUSHCHEV is to take the initiative and to impress upon the minds of Western leaders that he already possesses in large quantities these missiles which he either does not have at all, or has only a few of.

42. S: Often there are tests of one character or another which in many cases are even successful, but he already yells about this as an accomplished thing. Thus the whole idea of KHRUSHCHEV and of the PRAESIDIUM is to demonstrate and to illustrate in one way or another such as launching of a SPUTNIK, even of a man in space, in order to impress your military leaders that the Soviet Union has everything. This is to force your government leaders and military people to do their planning on the assumption that the Soviet Union already has a tremendous military potential, when in reality it is only being developed. And even Sergey Sergeyevich (VARENTSOV) remarking directly on the words of KHRUSHCHEV said to me, "Oleg, we are only thinking about these things, only planning, even though we have had some successes here and there. But in order to get anywhere one has to increase production tremendously and to train cadres."

43. S: Thus beginning with the idea of training cadres, the Artillery Academy (now Rocket Academy) Dzerzhinskogo has a student complement of 2,500 and the annual graduating class will vary between 450-600. And even though this is only this one academy, the graduates will still require several years of practical experience and training before they can be effective. With respect to this the effort is significant and the scale of operations is also significant. Billions of rubles are being economized elsewhere in order to develop rocket technology. I mentioned this earlier and gave proof and indications thereof and I also know what to seek for further proof, and despite the fact that VARENTSOV has constantly said that there is an enormous amount of

work to be done not only with cadres, but also with equipment, rocket-types, etc. KHRUSHCHEV is yelling that we already have all this. He says all I have to do is to wave a hand and he can fire rockets in the direction of Cuba----but why is he not doing this? This is a bluff - ..

44. S: Sergey Sergeyevich (VARENTSOV) said that they can hit the continent of North America, but to hit a target at this great distance, no. G: Exactly when did VARENTSOV tell you this? S: He told me this at dinner and at his dacha; this year alone he mentioned this three or four or even five times. He said that we have in our arsenal operational, that is, tactical rockets, and we have rockets that can reach South America, the United States, or Canada, but not accurately. G: Are such rockets deployed at missile bases already? S: These test rockets, which are still undergoing further tests are not on bases. They do not have the capabilities of even firing one or two. They do not even have hundreds in a testing status. They may have only tens in that category. Even in sending up a SPUTNIK or a man in space they have all of the scientists and rocket technology mobilized for the effort, and before a SPUTNIK is launched they have several failures. Several men were lost in their efforts to put a man in space. You probably even heard that the dogs were lost somewhere in the ether. I was told that there were several unsuccessful tests with humans. J: When did you say that VARENTSOV said this? S: Several times this year in 1961 and also a number of times in 1960. He also complained that more money is needed for rocketry.

45. S: The main idea now of KHRUSHCHEV's statements is to create an effect on external ears, but the preparations are being carried out intensively. The tendency is to attain mass production. Those tactical rockets which have already been developed are being produced in great quantities, and they can be launched at any time to the extent of their operational ranges. But with respect to ICBMs, they have had one failure after another. They remain silent and they continue to throw millions into the effort and if they have one success then it is used to impress you people by pretending that there are hundreds of these. But there are no such hundreds. That is only idle talk. However, keep in mind that one day they will be there. This must be assumed since the entire economy and politics are geared for such development. The basic problem is to develop a huge rocket with respect to

[redacted]

#10

the war head size, but with a high calorie fuel which requires little space. On paper they even have some success there and when one considers that millions of men's efforts are directed in this work and that the entire economy of a nation as directed by a one-party system to which all is subordinate, they can do this. And eventually they will work out such rockets and they will be made ultimately in mass production. In my own opinion, and my opinion here plays a very insignificant role because these are very important matters and my opinion does not count even though I am an officer inthe general staff -- after all, I breathe this air of rocketry and I would say that in two or three years they will have such rockets developed. There will be definite developed types in production.

46. G: What was the thinking back in 1957, when NEDELIN was put in charge of the so-called Rocket Directorate? S: Simply for the purpose of centralizing control and to separate the Ground Force weapons from the Strategic weapons and that NEDELIN would have no interference in his work for which he was allotted billions in money as well as factories and scientists to do this work. Even now it may be possible that somewhere in the Far East or in Kapustin Yar there may be some rockets which could reach other continents and even detonate with an atomic, even hydrogen-type explosion. But such launchings would be completely unplanned, uncontrolled, and certainly not of a mass variety. Of this I am entirely sure, but in two or three years there will be a different picture. This is because such a tremendous effort is being devoted to this. I even saw with my own eyes at the end of 1959 an order which said that the monies to be economized as the result of various dismissals from the army and people put on pension would be designated for 'kindergartens' (Note - This is slang for rocket construction.)

47. G: Do the students at the Artillery Academy wear distinctive insignia S: No, under no circumstances. All wear the basic military branch insignia. Most of them wear the black insignia of artillery troops, that is, the conventional rifle artillery. Do you remember the data I gave you about atomic artillery? That is, the technical data I passed you concerning an atomic cannon and a mortar. At the parade in Moscow (1960),

[redacted]

he dragged out two cannons. They were enormous. These were the 310 mm cannons. It was a rifle cannon. There was even an order by KHRUSHCHEV to impress the Americans and the British and to show these cannons as if they were in mass production. They do not usually take off the covers. Anyone who does not have a permit to enter House No. 1 cannot see these weapons unless they are covered. But at this parade the covers were removed and photography was permitted to impress the observers. After all, the technical details were not revealed. These were shown at a time when there were very few of them to give the impression that there were more of them, but since then quite a number have been produced. G: Does your long range air force have any jurisdictional control over rockets? S: No, they don't, but they will have control over the atomic bombs that they can carry.

48. G: That is clear. Now in order to clarify a question on the V-75. Remember you said that the combat table of equipment consists of 96 units. S: Let me see my original notes. (Subject was shown notes.) I wrote here that at the launching pads and to the immediate rear there are 96 combat-ready rockets. This is for a battalion. G: However, how is this allocated? The battalion has six launching pads. There is a mounted rocket and one ready to fire. S: That's right and the rest of them are echelened back ready to move up as needed, but the total is 96. H: How is it then that if there are six on the pads and six ready, totalling 12, how is it that they manage to get off 14 shots as he reported? In other words, with six firing and six ready to fire, how could they have time to get the other two into place? (G translates.) S: That's easy. In the first place, in the Sverdlovsk area there were two battalions, not one, and both fired at POWERS. It so happended that the new battalion that was just deployed there was the one which hit POWERS but the other was firing also.

49. G: That makes it clear. But tell me, are there only two battalions for the Sverdlovsk area? S: That's all there are and they cover a wide space but when your planes flew by five or six times before, they were far enough away from the rocket installation to be out of range so they were not fired at.

[redacted]

#10

At that time BIRYUZOV received a reprimand for not being able to protect important installations from hostile aircraft. Since then the defenses have been reinforced but they are still very insufficient to protect such a large area.

50. G: Let me cover these small details, which are very important on rockets. Then we'll show you the pictures. When the designation 8A61 is indicated, what does the 61 mean? S: Whenever the prefix "8" is written, that is the designation for a guided missile, and the correct designation but classified is the R11 for the missile you mentioned. But the 61 has reference to some production model serial, exactly I do not know how it refers to this. G: Similarly, the R1 is called the 8A11, and the R2 is the 8ZH38. What does 11 and 38 mean? S: There is no way of determining the relationship of these numbers to the rockets. G: How about the R-5, R-7, and the others -- Do they have similar equivalent designations? S: Of course, they have definitely similiar designations, but I don't know what they are. The significant thing to remember is that the prefix "8" designates guided missiles. G: What do the letters, such as A and ZH mean? S: Possibly they mean shop design indexes, but I do not know. G: I think I have found a copy or typographic error. Please tell me which is correct. Is the T.G.-02 for R-11 the same as TGO-2 of the V-75? This deals with fuel and logically would be the same. S: That is clearly a copying error. It should be TG-02 for both of them. Sometimes this fuel is simply called TONGA with a number behind it. G: Here is another question. You wrote here about the weight of launching fuel, PUSKOVOGO GORYUCHEVO; exactly what is it? S: This is an igniter fuel which is first set off and which, in turn, through its 3-set sequence, ignites the main fuel mixture. It is called the initial fuel and has its own separate tank. G: Is it used to heat up the other fuel prior to movement of the rocket? S: That is exactly right.

[redacted]

[redacted]

R11 Range varies with W/L weight (incl)

51. G. You give a range here of between 290 - 300 kilometers, but only 150 kilometers when the rocket has an atomic warhead. Why is the range cut down with the atomic warhead? S: That is simply because of the weight of the atomic warhead, whether it's of one plutonium type or of a hydrogen type, is much heavier. But the fuel quantity thrust and the fuel quality is the same. Therefore, it is simply a matter of physical principles and the same charge is used in all of these free rockets. Therefore, the range is cut down almost by one-half when atomic warheads are used instead of conventional ones. In order to have the longer range using warhead, either the size of the rocket must be increased to permit a greater quantity of fuel or a more highly caloried fuel must be used and they do not do this.

rocket warhead repeats Warhead Const-

52. G: Is the warhead container the same in construction and size for atomic as well as for conventional warheads? S: They are different because they require different shapes. This is primarily due to the temperature regulating equipment which is required for atomic, as compared to conventional, warheads. There are all kinds of intricate heating and cooling instruments and piping for Winter and for Summer use.

OK-201

53. G: Another small correction -- at the launching site you gave a designation for the oxidizer as OK-201. Later you wrote AK-201. Presumably the AK should be an OK. S: It should be OK, since OK stands for OKISLITEL. Incidentally, all of the data in chart form are exact since I copied them directly from manuals.

Supply base a launch point

54. G: How many launch points can be served by one supply depot? S: Say the main supply depot is 100 kilometers away and brings up the rockets by rail to a point 50 kilometers away. This is the immediate supply base for a given size unit such as a battalion. There is no limit after the number of rockets held in reserve at this supply base. They would have the minimum organizational rockets for the unit supported but the tactical situation or the expected rate of fire will dictate how many rockets are at the supply base at any given time. This is determined by the higher command.

R11

55. G: On your sketch an element of doubt came up -- the R-11 rocket information says that the battalion has three batteries of two pads each for a salvo of six rockets, but on the sketch only three launching pads are shown. S: (Examining his notes) I made this sketch to illustrate the deployment distances between pads, the technical position and the supply base. There are three other pads further off but I did not show these.

[redacted]

56. G: With respect to the R-2, the minimum range is 200 kilometers and maximum is 610 kilometers. An average of 560 is also given. What does this mean? S: This is the exact design range which is computed on the basis of the fuel and its thrust. The rocket can be fired at shorter ranges and it can attain a maximum of 610.

57. G: Is this done by varying the volume of the propellant? S: No. The quantity is always constant and so is the operation, but it can be cut off at an earlier point in its active phase and the rocket will then fall at a shorter range. The balance of the unused fuel is simply wasted.

58. H: Can we show the new photographs of rockets now? G: I only have one photograph here to be rechecked and we can add this to your others. S: (looking at photograph no. 1) This is a free rocket and I believe it is the "FILIN", the 3R2.

59. (looking at photograph no. 2) S: This is the typical R-2.

60. (looking at photograph no. 3) S: This is a developmental model. It is a rocket that had been constructed but had been rejected after tests. It had never been produced in quantity nor given to troops. It is not the R-11 and it appears to be some intermediate experimental rocket which was shown to confuse the observers and to pretend that such rockets exist. I don't know its exact designation. I think I have seen it before and it appears like a development of the R-2.

61. (looking at photograph no. 4) S: This is a free rocket, dry fuel propulsion and looks like the 3R1.

62. (looking at photograph no. 5) S: This is also a free rocket, dry fuel propeller and looks like our "Mars" or the 3R2. Now the rocket does not have its basket-like cover but the launchers are the same as in the earlier models.

63. (looking at photograph no. 6) S: This is a free rocket with dry fuel charge. It is not a two-stage rocket but consists of two sections. There are nozzles emerging at two sections of the rocket.

64. (Subject looking at photograph no. 7) H: This one he has seen before but there is some doubt about it since he said it was the (3R1) before. S: This is a free rocket with

[redacted]

[redacted]

a dry fuel charge and it is the 3R1.

65. (Subject's notes were examined together with him and the following clarifications were made. The expression K X Cal. Kg Grams was explained by Subject to mean K a heat coefficient per kilogram multiplied by calories per gram.) S: Generally, Russian letters and terms are used throughout except when internationally accepted Latin abbreviations are used such as "Q" here for a heat value.

66. G: On the 3R2 and 3R3 reports there is a missing or illegible word in connection with the magnitude of the powder charge. How should this value read? S: This should be kilogram meters per kilogram. I'm sorry it isn't clear. You should have seen how furtively I had to write this when I heard footsteps coming. G: I am not balling you out, I only want you to clarify it. G: When atomic warheads were mentioned, were their yields stated? S: This depends on what the tactical mission is and how far removed ground zero is from friendly troops. G: What I mean when they give you the R2, R1 etc., did they state what atomic yields each rocket is designed for? S: They have variable yields. I'm glad you asked this. Although we have not yet developed a very small yield atomic weapons such as 1 and 2 kilotons, we do have them 5 kilotons and up. Rockets can have atomic warheads mounted on them which have several different equivalents. G: You are assuming then that a warhead that can accommodate a certain yield of atomic charge can also accommodate a greater yield within the same space. S: Yes, there are warheads which can have various atomic yields in the same space. I remember working problems with the same rocket which had two different atomic yields. They are now working on having numerous atomic yields for the same size warhead. By the way I got photos of the launching installations because the instructor who was an expert on these had been at the test sites and had taken a number. He had some extra copies and told me to paste it into my working folio as an annex. At the end of the course our working folios were picked up and destroyed but I did not paste in the photos, and kept them.

67. G to H: I just have two more short lists to ask him about. Please find his notes on the TRA and on miscellany. G: To what extent are spare the components of missiles provided by industry and to what extent does the army build the missiles? S: Everything is built by industry. They then assemble the parts at the rocket bases and store them as dry rockets

[redacted]

(unarmed). The army conducts all repairs and maintenance. This is done at the GAU bases but nothing is manufactured by the army. We receive everything completely. Very extensive repair would also be done by the factory.

68. G: You wrote about arsenals and mentioned the 3rd type as a mortar arsenal and the 4th type as a storage arsenal and then you gave an example of this system in a military district. Is that correct? S: (reading his notes) Yes, you read that correctly and this refers only to free rockets and there are entirely different bases for guided missiles. (This question was to clarify the writing in Subject's notes)

69. G: It says here that there is a 420 millimeter mortar. Was there not also a 400 millimeter mortar? S: Yes, there was. G: When was it operational? S: This is an old model which we had at the end of the World War II and it conducts slow fire but the 420 is a new one. G: Is the 400 now obsolete? S: No, they are still being used but they are not making them any more.

70. G: Where did you get the information under the heading "miscellany"? S: Mostly from documents. That is the specific document for the specific rocket the note refers to.

71. G: What is this anti-tank missile - PTURS? The "U" infers that it is guided. S: That's right; it is a guided missile which is guided by a wire. The wire is rolled off of a drum and guides the missile. I will give you all the details of this missile later. It is a very powerful missile but it is clumsy to use with the wire. G: What is the purpose of using the wire? S: That is to get a perpendicular hit on a tank instead of a glancing blow. It is still being developed; it is not perfected yet.

72. G: What is a DURS? S: This means long-range guided missile and to this class belong not only strategic missiles but pilotless missiles.

73. G: Are there any other aircraft-missiles besides the P-5? S: No, they are still being developed. G: Are there special missiles? Doesn't that just mean atomic? S: Yes, of course. It is sometimes said that way.

74. G: How about free anti-aircraft rockets? S: We do not have them yet but they are also being worked on.

75. G: Do you recall when they were firing long range missiles from Siberia or from Kamchatka to some point in the Pacific Ocean where they even requested an area cleared in the impact zone? What was the success of this? S: That was nothing else but luck. A complete fake. This seems to be KHRUSHCHEV's policy. I believe that some of these wild statements not only are not believed by our military people but also not believed by your scientists and leaders. But the idea is to impress the people of England and America.

76. G: Do you know a young designer named SUKHOV? S: No, I don't. G: What happened to GURYEVICH? Remember he was the partner with MIKOYAN as the designers of the MIG. S: I don't know.

77. G: Did you ever hear of a YAK 27? S: There is such a plane; I have heard of it. It is a jet and it is designed by YAKOVLEV. Remember I told you that once I was ordered to destroy a MIG-15 when I was in Turkey. I rode all over Turkey for 28 days and received a commendation for this. What happened was this -- Just after being repaired in ROSTOV this plane, a MIG-15, was en route to BAKU. It followed the wrong railroad tracks near the Turkish border and crashed in Turkey. A cable from Moscow ordered me to investigate the wreckage and to remove the "SRO" equipment if any was on board (IFF equipment for identifying friendly planes). I went down there with a colonel from the KGB and found out that no such equipment was aboard, so he left and made the report. Then I was ordered to destroy the plane, so I arranged to do this after having had the flyers released and escorted back to our territory. After the fires were out the plane was still whole; all it did was to get charred. The cable from Moscow told me not to worry since the Americans had already obtained a MIG-15 out of Korea but that I should destroy it anyway. So I got TNT, wired it up and set it off and again the plane was whole even though the individual parts were scattered. Finally, after removing all parts of any value, I only had 5,000 lire left to complete this job so I hired local workmen to hammer the remaining pieces and the pieces were then put on a small barge and towed out to the Black Sea and dumped. Even then the fishermen complained that the nets would be torn. Of course, before I sank the

pieces I photographed the remnants and sent them to Moscow.

78. G: Do you have any special questions for him or do you want to show photographs? I still have some questions on the PVO that it would be well to ask if we have time before going to the pictures. In considering the PVO districts, first of all they definitely go across boundaries of the OBLAST military districts, do they not? S: Of course they do. They encompass a number of military districts. G: Do you know how they are organized? S: Let me tell you those I remember by name. The Moscow OKRUG, then the Leningrad OKRUG, the Sub-Carpathian OKRUG -- there is no Baltic OKRUG. Then further east the Baku OKRUG. Then there is the OKRUG that covers the entire Ural area; I can't remember its name. And there is also an OKRUG in the Far East. These are the RAYONI and each has its own headquarters (Subject uses the word RAYON loosely; it should be defense district). There is a PVO with troops throughout the whole country and when I said that there is no PVO OKRUG for the Baltic States, they still have a PVO with the troops there. The PVO with troops are subordinated to the commander of the military district but the PVO OKRUGs are independent.

79. G: Do they have their own organic aviation? S: Yes, they do and they are part of their tables of organization.

80. Did you ever hear of the latest fighter planes with designation SU -- the numbers are low, such as 2, 3, 4, 9 or T3? S: I have never heard of these. G: Are the factories at KOMSOMOLSK, OMSK, NOVOSIBIRSK, GORKY and TBILISI? S: These factories are all in operation but in addition they have factory departments which also manufacture rockets. After all much of the structural work is the same.

81. G: Does the PVO still depend largely on anti-aircraft guns? S: Absolutely, and they have guns with a pretty high effective ceiling but in addition they are reinforced.

82. G: Is the 130 millimeter anti-aircraft gun the largest caliber? S: I know we have developed the 100 millimeter gun to a high degree of efficiency and I know there is a gun of a larger caliber but I don't want to guess what that caliber is. There are none larger than 130, however, and another very effective gun is the 57 millimeter anti-aircraft gun which is automatic and operates effectively against low-flying aircraft.

83. G: What do you consider are the weaknesses of the PVO of the land?// First of all, they do not yet have sufficient numbersof trained personnel. Now they have their own schools -- a technical and a command school. Two years ago, in KALININ, they opened an academy for the PVO of the land. This was the old installation formerly occupied by the rear services academy imeni KALININ. The old academy was broken up and its cadres were sent to various other institutions. For example, the quartermaster service had a portion sent to Leningrad and another portion to the FRUNZE academy. The new PVO academy is under BIRYUZOV and has both a man and technical faculties. (In discussing how the names of towns are changed at the whim of the Soviet chief of the time, Subject mentioned that CHKALOV was removed at the whim of STALIN just as recently MOLOTOV was renamed PERM. Subject then drew a sketch of bewhiskered circles indicating a Soviet joke about the progression of Communist leaders since MARX.)

84. S: I now know what you would like to obtain about rockets and if you have a very tiny wire-type tape recorder I could even copy down everything VARENTSOV says, but it should work perfectly. We have such but they are not perfected. G: We would rather work effective communication means and remove compromising material from you as soon as possible. An instrument such as you describe would be certain evidence of clandestinity.

85. G: Since it's getting late, let us look over a few more photographs and we'll end this meeting with that.

86. (looking at B-2) S: He's a colonel in strategic intelligence. He is now working in KONOVALOV's Second Directorate, the European Directoate in Moscow. I don't remember his name. He graduated before I did; he is much older.

87. (looking at M-6) S: This man is from the KGB.

88. (looking at M-12) S: This is PERVOUKHIN, the [redacted] ambassador. He is considered to be a very intelligence man.

89. (looking at N-5) S: This is one of our people in GRU; he is in Strategic Intelligence.

90. (looking at N-4) S: This one is also ours and is also in Strategic Intelligence. I saw him in Moscow but that was sometime ago. He may have been sent overseas since.

91. (looking at F-31) S: This is KOSITSIN. He was replaced by SESKIN, who is now the REZIDENT in Japan and is also military attache, which job KOSITSIN formerly had. Now KOSITSIN has become a chief of NAPRAVLENIYE (Anglo-American) under BEKREMEV, and he replaced Colonel IVANOV. IVANOV was sent to the MDA as an instructor and he formerly had been in Istanbul as the REZIDENT.

92. (looking at F-60) S: This is our GRU man in Strategic Intelligence.

93. (looking at F-63) S: This is also our GRU man in Strategic Intelligence.

94. (looking at F-64) S: Here is this SERGEYEV who has two names. He is a colonel and SERGEYEV is not his right name. He is a Navy man, very experienced, and is now in GRU.

94. (looking at F-65) S: And here is Mr. SESKIN! He is the former chief of the Illegals school and is now military attache in Japan and is the REZIDENT.

95. (looking at F-67) S: And this is SESKIN's assistant. He graduated from the MDA.

96. (looking at F-74) S: This man is in the KGB.

97. (looking at F-78) S: This man is in Strategic Intelligence GRU in Japan, but he is not an assistant to SESKIN. He is under some other cover.

98. (looking at F-85) S: Here is a very dangerous man. He is now working in GRU in Strategic Intelligence. I don't see the assistant to SESKIN who is the air attache. He's a lieutenant colonel and he has already left Japan.

99. (looking at Q-14) S: This is a Strategic Intelligence Officer of the GRU.

100. (looking at Q-24) S: He is a naval officer working in GRU in Strategic Intelligence and he graduated from the MDA but is not my classmate.

101. (looking at Q-31) S: This is the second time that he has gone to France. He is a classmate of mine. He graduated from the MDA with me. He is a naval officer. His wife is an

instructor in foreign languages at the MDA. He married her there and she is five or six years older than he is.

102. (looking at Q-32) S: Here is a Hero of the Soviet Union. He is now a colonel and he studied at the MDA with me and graduated in the class of '53. He was the senior assistant to ZOTOV when ZOTOV was the military attache to France. He is now a senior instructor at the MDA in the tactics department.

103. (looking at Q-44) S: This man is KGB; I have seen him often.

104. (looking at Q-89) S: He is an intelligence officer, GRU.

105. (looking at Q-109) S: Here is an aviator. He had been in Paris; now he is working in Moscow. He is in the section of Foreign Relations of the GNTK. He is a GRU lieutenant colonel and is working for the little ROGOV just as I am.

106. (looking at Q-113) S: Here is a KGB officer. I believe he is working under newspaperman cover.

107. (looking at Q-116) S: He is a Strategic Intelligence Officer of the GRU.

108, S: Let me look at some other pictures during the daytime tomorrow when my head will be fresh. Now about tomorrow, I will drop in to see you in order to pick up the information on HERRIMAN, and I'll have to go to the embassy in the evening. Is it alright if we do not meet tomorrow evening? G: Of course it is. If you're expected at the embassy, you'd better be there. S: I will drop in a little after 3 tomorrow afternoon but I can't tell you the exact time. G: We will wait for you. S: I'll be able to stay a half an hour or maybe as long as one hour. Let us work very intensively on the second of May. G: Since you plan to go shopping tomorrow in order not to be squeezed for time would you rather come at 4 o'clock instead of at 3 o'clock? S: No, 3 o'clock is alright.

109. S: By the way, did you take an advance for me from my account so I would have enough to make my purchases? I want to leave everything with WYNNE. I only plan to take with me one suitcase with purchases. WYNNE can bring me one

suitcase next time he comes to Moscow and possibly the other one on a later trip; however, I want to buy all the things myself. What I want to take back with me now is this: a whole mass of small inexpensive items, then an expensive gift for VARENTSOV and the items which I promised to bring back to my wife. For this reason, I request an advance from my account. H: How much do you want now? S: (laughing) How much is there? What I want to buy now are some earrings, a small diamond --. G: Remember that we also plan to give you a fairly good sized quantity of rubles to take back with you. S: Very well, at least I'll have my debt covered and have you thought any further about the desirability of my purchasing a DACHA? G: How do you plan to do this? On a gradual basis; to pay it off piecemeal; or what? We think it could be conspicuous for you to show up with a large sum of rubles suddenly. S: Nobody would know that I did not have it saved up from earlier days. G: However, if you have this immediately upon your return from England... S: I would not buy it at once. I would be looking around for an economical DACHA for a period of two to three months. I can even register it in my mother's name. G: Well, as you receive income from your monthly earnings with us, you can put aside partial sums to pay for this. In fact, I'll tell you in advance that we had planned to give you 3,000 rubles Out of this you can settle your indebtedness and put away a portion. Later as we give you more money you can gradually save. S: I hate to get money gradually because money melts away from me. I was thinking of getting a modest DACHA, possibly an old one repaired or a new one with time payments. In my present condition by rank and age, it is perfectly normal to have a DACHA. Maybe I don't understand the situation; tell me quite frankly how you are planning -- are you awaiting for additional materials from me on the basis of which you will evaluate how much to pay me? Or possibly I am not authorized to make the request that I am making. Please explain this to me.

110. G: In the first place, ever since we have been working together you have been put on a regular monthly income basis. This has nothing to do with the quantity or value of materials that you bring. S: Very well, that part of it I understand, and you have been generous in the salary you allocated and I thank you. But the material which I passed to you you do not regard in terms of any

financial remunerative value? G: Thus far we have simply established an escrow account for you on a continuing basis and your account will grow, less your withdrawals, as time goes on. It makes no difference whether you are here or in Moscow. S: So this has been the decision with respect to my request to evaluate my materials. G: Yes, but that does not mean that a bonus or a reward that we may evaluate for you, based on your overall work with us, would not be given you at the time that you feel you should come over to us to stay. S: However, when I come to America I will have to have something as a nestegg to start from. I'll have to buy a house and a car and a yacht. (laughing) I understand you, but right now I need a certain minimum sum in order to buy the things I should. I must buy a few very small diamonds, two watches and a decent gift for VARENTSOV.

111 H: How much has he got now of that which we have given him? G: Remember we want you to buy what you need but you must get rid of every pound here before going back. How many pounds do you have now? S: I have £90 now. H: Isn't that enough for just tomorrow? Will he be able to spend the £90 in one day? S: If I have to buy diamonds, £90 will not be enough. Even a small ring and a couple of earrings will cost more than that. Is it difficult for you to provide pounds? Did you already give WYNNE what you promised to give him? H: It must be explained to him that our payments to WYNNE must be done very carefully because there is the matter of taxes. We have to account for this so we have arranged for a way so that he doesn't get taxed. S: You see I'd like to buy just a few things, but good things are expensive. G: Well, tell me exactly what you mean? S: I feel ill at ease at asking for the money just like that. But tell me if I'm doing this right or not. G: We'll give you another £50 now and we'll see how you get along with that and what you have, then you can tell us what else you need later. S: Fine, I'll bring you all my receipts and you can see for yourself. (Subject then bade farewell and left at 0045 hours on 1 May 1961)

[redacted]

(17)

Meeting #11, London, England, 1 May 1961

1. (Subject arrived at Room 360, Mount Royal Hotel, London, at 1502 hours on 1 May 1961. Immediately upon entering Subject saw the medicinal preparations on the table which had been acquired by the doctor for Subject.) G: These are your medicines, but we will change the labels so that no name will appear thereon. S: Why can't I simply say that I bought it at the pharmacy? Can't I say that? G: No, because it is a prescription. S: And if I rip the whole thing off? G: No, we will take care of it, then give it to you. S: So this is the situation. Business first. G: Not to get these medicines mixed up. S: Very well. (All laugh.) G: You must know which one is the tranquillizer. S: Okay.

2. S: Yesterday there was a closed party just for our Soviet people, a small one. This morning per schedule, up to 1500 hours at the premises of the Tengpredstvo -- I have never been there: it is in another section of London -- they will have childrens' plays, sports and dancing. There won't be anything else today. We will work today if you wish. Today is the first of May, a holiday, so we have to work. I was told that the parade was very pompous; they showed rockets. One was a large rocket from which space men jumped out, and then the other rockets. They say a lot of rockets were shown, but I think nothing new was shown. That's what I was told, but it has to be checked, as I did not see it. G: We may be able to show you some photo shots that were made from the TV presentation. S: Good, as a check, I will tell you if there was something new, or if everything was old. Tomorrow at 2000 hours, a movie, "The Blind Musician" will be shown at the Embassy and at 1900 hours there is an excursion to the London Museum. We won't go to the museum, because we have work to do with the delegation. So we will work a little earlier.

3. S: Now the day after tomorrow, the 3rd, I am meeting the PRESIDENT -- I don't know exactly when but I will find out tomorrow. He will set the time. PAVLOV flies on the 6th, not the 5th, and we return on the same plane. We take off at 1235 hours London time. We leave the hotel at 1100 hours on the 6th. I will be in Moscow at 1805 hours. In Moscow, within an hour, I can call and report on my flight there and everything. H: Yes. S: There in Moscow -- leave the things on Saturday and go for a walk. I won't use my telephone at home. H: Okay.

4. S: The new hard line America is taking towards Cuba has everyone talking at the Embassy. They are alarmed by it! They say if America undertakes anything on her own, not using the Cubans in the USA, then we will be in a difficult position. Why! Because we can only send food, weapons and gold. There are no

[redacted]

ment. If we give them rockets then there will be a war. I spoke to the Counsellor, people from the office of the Military Attache. Their thinking is -- It seems that the Americans will adopt a very severe course of action and we will be in a very difficult position because we will have to do something. Tomorrow I promise to find out something from SHAPOVALOV about the report. I won't force him: it wouldn't seem normal. But I will get at least a slight report.

5. S: I propose that we work tonight: I can be free at 2100 hours tonight, but tomorrow, not. G: Fine. S: Tomorrow possibly during the day, if we leave Ferrante early ... By the way I called today at about 1400 hours and no one answered. G: Strange! You weren't connected? We were sitting here. S: No, I said "360". But when I called to tell you about the TV presentation, I was connected at once. Only at this time in the morning did I realize that it was necessary to go there, back at once to the Embassy. Now, I had this idea. Think about this. There is an awfully large number of persons at the Embassies in America, Great Britain and the other Western countries. We can make great difficulties for the Soviets, starting with the MID, the KGB, and our Strategic Intelligence. This should be checked to see if it is practical -- to have only one Counsellor, one 1st Secretary, one 2nd Secretary: to cut them down and cut down the number stationed in Moscow if it is possible. I don't know all the existing problems. This is not my task. My task is to offer suggestions based on the actual situation. There is a huge number of people -- Look at London! Why are so many people kept here? And I think there are more Soviet representatives here than (Western) representatives in Moscow. G: So what is your schedule for tomorrow? When will you be at the Embassy? S: Tomorrow evening at 2000 hours, there is a movie there but, of course, it is necessary to go there at 1900 hours. G: Of course. S: During the day we will go to Ferrante. G: Okay.

6. S: And tomorrow I want to contact MERRIMAN. G: Very well. S: To prepare everything with MERRIMAN, I will write down everything that you prepared. H: He ought to try and do this, because MERRIMAN is a very busy man. He should ring MERRIMAN about 0900-0915 hours tomorrow morning. G: Tomorrow, call MERRIMAN at 0900-0915 hours. Write down everything. I will give you all the information. I have all the information. Write down as much as you wish.

7. S: Let's finish the other thing. It is necessary to check on the diplomatic channels. If we have fewer representatives in Moscow then, through proper channels, we ask why they have more than

we do? But not remove the low rank'ng persons (DVORNIKI), but the others. This would create a very difficult situation. Who will be removed? Everyone is either connected w'th someth'ng or has special ass'gnments. A struggle for supremacy w'll commence. Let's el'minate from the Strateg'c Intelligence. The KGB will apply pressure and SHELEPIN will ask KHRUSHCHEV to leave his men. We, in turn, w'll apply pressure and will ask that our men be left. If the (representation) 's not equal, then this should be done. If the (representation) is equal, it may be possible to remove one sect'on. We should say, "Let's discuss this. Why should we have so many representat'ves, both yours 'n our (country) and curs in your (country)." If this won't do us any harm.. (Present) it in this way. G: Very well, we w'll consider this.

7. G: Here is the information about MERRIMAN. S: Okay. I will wr'te it down -- MERRIMAN. What is h's name and patronymic? G: Arthur Douglas. Age 69. Wife and two children -- son and daughter. S: That is not necessary. Two children is enough. G: Yes. He likes his little grandch'ld (girl) who lives 'n Kent and whom he visits often. S: That 's not necessary. G: Educat'on: Secondary school 'n Manchester. Then he attended two univers'ties -- Cambridge and Durham. S: So he has two higher educations? G: Yes. Next he has awards and honors. S: How many awards? The names are not needed. G: He has two of the h'ghest awards. The George Cross. M: Tell him what he got it for. G: He got it for -- he fought in the Army dur'ng World War I (1914-1918). S: Such dates are not necessary. G: And the Order of the British Empire in 1942. He got the George Cross for d'smantling the f'rst German magnetic mine. S: Is he an engineer by profession? G: Later he was a consultant for all types of mines for the durat'on of the war. The disarm'ng of all kinds of new mines. He is a spec'alist. S: That is clear. G: His military serv'ce: During World War I, he was in the Royal Army Ordinance. S: This is not necessary. He part'cipated 'n World War I. G: In 1939-1945 he was in the British (Army) Engineers. He visited the USSR in 1944, as Scient'fic Advisor to General ALEXANDER. This is important because they can check this and find out about him. S: Is he Lord ALEXANDER? M: Yes. He is a Lord now. He was not a Lord at the time. G: You have h's positions -- the first t'me he was connected with military ordnance; and the second t'me with the engineers. Now his educat'on... S: Two universities and secondary school. G: Now the ranks he received and what famous organizations he belongs to. S: The organizations are not necessary. G: Let me give you an example. He is a Fellow in the Royal Society of Edinburg, Companion in the Institute of Mechanical Engineers, a Doctor of Science. S: A highly educated person! G: He has a third degree. S: A Doctor of Science. G: In the city of Lisle. S: The city is not needed -- a Doctor of Technical Sciences. G: He is also a Master of Arts and he 's a Compan'on of the Inst'tute of Technological Engineers. S:

So by education and work experiences, he is an engineer; he is a member of prominent engineering organizations. Does he have any inventions? G: Let's see. Also, he was with General PAVELL; he was his scientific advisor. He does have inventions. Write this. S: This is very good. We never give it so completely. G: He invented a process by which he can silver-plate objects in such a manner that they won't tarnish or corrode. He won't sell this patent and keeps it for himself. He is very proud of the fact that he plated a small ship, that belonged to the Duke of Edinburgh, in such a way that it does not tarnish. Before this it was impossible to clean all the small parts of the ship. Now it stands as an example of scientific achievement. S: Preserved it for ages. G: This is an example. S: I understand.

9. G: Now a personal description. S: Now more about him. G: Of course you can describe him. He is short, wears glasses, a bit fat -- you know this yourself. S: I know this -- bald, glasses. G: He is a member of the City Delivery Company. Is that transportation delivery? H: No, no. You can't explain that in any other language. This is one of the old city companies. I don't know how you can explain this. G: What does it do? H: It doesn't do anything. This is a sort of honor. There are a lot of city guilds and things in the city. G: Oh, I see. A member of the London Council. S: Of the Deputies of the Workers (laughs). H: It is an honor to be elected to one of these city companies. G: You understand, it is a special recognition. H: It is not public at all. G: It is an honor for his accomplishments. S: Ah! An honorary member of the London Council. G: By character, he thinks a lot of himself. He knows what he knows and wants to convince others. You know he thinks a lot of himself. S: Yes. G: He likes to talk about all the important persons he knows. S: So he has a wide circle of friends and likes to talk about them. G: Exactly. J: That is an important point! S: Wide circle of contacts and friends. G: And wants to enlarge this circle, and to improve himself technically. S: In other words, he continues to work! G: And wants to go further. S: Yes, further ... G: And he has plenty of initiative. S: And is highly loyal to the Soviet Union. Can I say this? (Laughter). G: He is the author of many books and technical publications. S: He is the author of many technical publications. The subjects are not needed. This is very detailed. They will say you know him like your father.

10. G: Recently he published a Metallurgical Dictionary. S: Author of a Technical Dictionary on Metallurgy. G: It is more like a textbook than a dictionary. S: Metallurgy. Very good! Very good! They will show interest in this at once. They will say, "Give us the address! How is the address written in English?"

Because there is Chelsea .....like the calling card? G: Yes. S: I left the calling card in Moscow; I have his calling card. G: And all his titles are printed on it. S: They are all written there. G: And you will be able to explain what they are because you now know. The first is an order, GC: the second, an order: then the medals. G: O.B.E. is the Order of the British Empire. S: Get his calling card. H: Okay. S: The RESIDENT will ask me for it because he will be considering this in terms of who to assign to contact him. G: Now the last-- this might be important. S: So I wrote the address, I will put a colon and you will give it to me in addition.

11. G: There is only one more detail about him. Despite all his important achievements and friends he still lives very simply, out of town, in a modest apartment that looks out on railroad tracks. S: Not in a fashionable neighborhood -- very modestly. G: Very. Not far from Streatham Hill Station. S: Please give me the address, I have his telephone but I can't ask him for his address because I will be all mixed up. G: How do you go there? You see there is this railroad station..... H: So he lives by Streatham Hill Station on the District line. S: Fine, now I have something to talk about. G: Is it enough? S: Yes. Plenty.

12. S: I want to report to you what I did today. Mr. and Mrs. WYNNE and I went to Harrods where we spent three hours. G&H: Aha! S: The best! I consider that it was right that KHRUSHCHEV was not taken there when he was in London. He should look at the garden, singing birds, the fountains! I was sorry I couldn't take VARENTSOV with me: he would have bought all the roses. (All laugh.) I should have loaded up a car and sent it. We looked at everything. Things are expensive there. Mrs. WYNNE helped me greatly and I made a decision and bought her a suit for 24 pounds as a gift. She was delighted. Because she helped. So I am minus 24 pounds. WYNNE has all the bills and receipts. G: We don't need the receipts. S: No? So that you can check? G: Who cares if it is more or less. S: It is just that one of your people might think that I took more pounds than necessary. I have three pounds left. H: You have three left? That is good. S: I didn't buy much. I bought my wife a regular Spring-Autumn coat, a coat for my daughter, a suit for my wife -- like the one I bought for Mrs. WYNNE, the same price, quality and color -- salad color. I bought one white blouse, bathing suit and bathrobe for my daughter -- two kerchiefs, two bottles of perfume, four lipsticks. I bought some after-shave lotion for myself. But things are expensive. Coats 25-26 pounds: suits 24 pounds; a few other minor things and three pounds remain. Please take some money from my account and give it to me. I have not bought the watch or the ring,

not a single pair of shoes or the purse for my mother. G: But you did get a sizeable percentage of the things. S: Yes. G: At least in quantity. S: WYNNE has everything. I did not bring anything here.

13. G: How will WYNNE carry this for you? It is dangerous. S: For whom? For WYNNE? G: Yes. He can be seized as a speculator. S: Who will seize him? G: At Customs. S: I can guarantee that WYNNE won't have his luggage inspected. G: How? S: I will meet him. G: He won't go through Customs? S: No, his suitcase will go through Customs, however, they don't look. They have never inspected his luggage during three years of his travels to the USSR. G: What would happen if they looked? S: If they opened it? Bringing various things for friends. A speculator is he who brings twenty sweaters -- then it is for speculation. When it is two, three things -- a coat, shoes, handbag -- he is bringing things for his friends in the London Embassy. I am 100 percent sure they won't open it. If they crack me, then it will be bad for WYNNE also. But I am not afraid -- I am a brave worker. G: But in case you don't meet him for some reason? S: This can't happen. I'm not going on TDY any place. G: No. We know that. S: Nothing will happen to him. They are nice to WYNNE. He has not compromised himself in any way. G: But at Customs they might make him pay duty. This can happen, no? S: He should say, "I am bringing things from London to people at the British Embassy in London -- their things. A handbag for one, shoes for another, etc." G: And if he is asked for his courier documents? Or something? I just want to make sure that we don't have any trouble. S: Heaven forbid! What courier documents?

14. G: If he appears with suitcases and your suitcase, how will he give the things to you later? S: Very simply. He will travel with his one suitcase -- one with two compartments, a standard one. I have seen it twice already. That is all. A raincoat on his arm. G: So you take the suitcase..... S: No. The porters take it. I meet him at the plane. The porters take everything there. I go to the captain on duty there and ask him to pass this man quickly. He will answer, "Yes sir!". I will present my document from the Committee. The second captain checks entry documents and stamps them. I will ask him to hurry him through. I will say the car is waiting. I will take a car, not from the Committee, but from one of my many friends with cars. I will drive him to the hotel. He will enter with his suitcase and mine will be left in the car. H: That's not too bad. G: No. It's alright. But we must check this out. S: Thank you. Thank you for worrying so much but I will work well for another two-three years. Then I will run (defect). G: So it would be better if you took less and WYNNE took more? S: One suitcase will be taken by WYNNE and one by me.

15. S: Now another thing -- I have another legend. Many in the Embassy are asking me to take packages to the USSR for them. Of course I will take two, three, but will refuse the others. I will take the REZIDENT's, SHAPOVALOV's -- SHAPOVALOV has a mother-in-law, a mother and sick father that he sends medicines to. These I will take, but to the others I will say, "I have one suitcase filled with my things and the other will be full of packages from here." I have already prepared them for this. They know already. Who will investigate or what will my delegation think? They will not come again in October. I won't come again either. I have them all bought (the delegates). Otherwise, in October none of them will come. H: That's a pretty good idea. S: Departure by air is at 1235 hours; at 1805 hours I will be in Moscow. Prepare seven shillings and six pence per person for airport tax. Everything is written down. The tickets are ordered. H: He will need more money to complete his purchases so we had better give him some more. S: The watch that I will buy will be in my pocket. G: That is no problem. S: If they touch my clothes then erect a monument to me. G: What is in the pocket is okay. S: We will work some more, then we will die.

16. S: You told me a good thing yesterday -- "If you have to run then run without suitcases and other property". G: You know it is a long way to run! (All talk.) H: What was that? G: He said, "If I have to run, where the hell do I go -- to the US or British Embassy?" I told him in that case, run to the nearest one. (All laugh.) S: I will go have dinner with the delegation now. I haven't drunk a drop of wine or vodka -- nothing. I have in mind the occasion of our celebration. G: You have a good percentage of your shopping done. S: About one-half. G: Well, that's not bad. I'm surprised you had time to do that much. S: We did it fast. Mrs. WYNNE wants to spend a lot of time picking things out. WYNNE only has the bills/receipts. He has a whole stack of bills; he will submit them later, so that you know that I have done it properly. G: Well we are not arguing about that. S: If I needed money I would need Soviet money, or things that I can sell to friends for Soviet rubles. I don't have the right not to bring someone a sweater, for example, to the wife of General VARENTSOV. Perfume -- for perfume I can take money. I will let them pay me the price of the article in the Commission stores, about 50-60 rubles -- 500-600 rubles according to the old system -- that's what they cost in the stores. G: I see.

17. G: There is 100. S: So you gave me 150 and here is 100? G: 250. S: Should I receipt for this? G: You are our co-worker, not an agent. With agents, you have receipts, etc. S: No, we take receipts from agents. G: From agents, yes -- but you

are in a different category. S: As long as you have reminded me of money, I would like to state my opinion and then we won't return to this subject. Inasmuch as you have made such a decision, or it is not made but you have a plan, I can flee unexpectedly with the family and leave everything. Leave things worth many thousands. The hell with them! Let them choke on them. You consider my EOD (1 April 1961), but I have been working for you much longer. My thoughts and opinions have split away long ago, just to work with you. But many Soviets have ideas who would like to (work) for you. But ideas are nothing: it is only a bluff. Action is important. I started working.....by the way, today it is two years since I finished these courses, the 1st of May 1959. At that time I started preparing the materials, all this, all other matters. Almost two years have passed and I have had this in my pocket. I wanted to start working for you actively eight months ago. You know this very well.

(18) S: Since there is this system of document evaluation, and it is important for me, I want to live well during the period that fate will have me live in the Free World. G: Of course. We understand. S: I would like to state my opinion again. Inasmuch as I don't have diamonds -- my father did not leave me anything in the English or American banks -- I can defect to you in six to eight months, in a year. I want to (defect) in two-three years, in order to do more with my position in the General Staff and my being stationed and working in Moscow. But it might happen that I will come to you earlier. G: Of course. S: I would like to request the following: That all my materials be evaluated separately. How? In any way! G: Okay. S: Considering of course, that I have already been given sums by you already. G: Of course! Of course! S: It has to be done very honestly. What one has earned, is what he should have. A person's ability determines what he has in the Free World. The stupid one is the street cleaner; the smarter one has his little shop. This is the way it seems to me, objectively. A (person) should get what he earns. G: Yes.

(19) S: The work that I did in advance during this period, I considered important. I strived for it. I attained it. I did everything I could regarding these matters. Now I will work on my new assignments and you will get (reports) from there. I will work actively in all ways and at a deeper level of comprehension. That is why I request -- if you consider the material to be of no value or if it is only average, this is a different matter. But if some of them have a certain value .... I recently read in the papers that the Americans paid one million for a file, a dossier of some sort on Brazil or some southern country. We heard this. A

million! Now you will receive f'fteen recru'ted agents who are recru'ted and working. This also has some value to me, as a worker. G: Yes. S: If I must come to you in eight months, then I will have $8,000. in my account. G: No! No! This is not the way it works. S: This will not satisfy me! That is not enough. I'm telling you this. G: You do not understand. S: I am telling you honestly. G: Of course not. We are talking about a general princ'ple.

(20.) S: I thought this through deeply today when I prepared this. You are work'ng with me now, but in a year or two you may get a promotion. New people, whom I don't know, will contact me. They won't know me, or will only kn w about me from what you tell them. This is just an example -- suppose you get a promotion at work. H: I think you better tell him that while this goes on we shall stay. G: We will be working with you permanently. S: And if you get a high position? G: No. This won't happen. S: Then I will have to start proving everyth'ng again. G: No! No! S: We have become acqua'nted, I confessed everything to you as one should. G: We understand your pred'cament, and we both vouch that we w'll work w'th you permanently. S: Thank you.

(21.) S: Now the last thing -- despite the greed of KHRUSHCHEV, we are very limited in our payments to persons who help us. If I ever get something of value for you about rockets, please pay the persons who have helped me -- that is all. That 's all that I will say about the subject. I came to you because of political convic- ons. I started work'ng for you in Turkey. Check all the f'les, my anonymous telephone calls against IONCHENKO, against the General and against the regime. Was I not ready morally? Yes I was! G: All this will be considered. S: I should be considered to be one of your soldiers, from that t'me on. G: This will be considered; don't worry. S: Check. I am sure the Turks have all this recorded. They understood me accurately. I was very nice to them. This strengthens my case. It helps me convince you, and it helps your higher authorit'es to understand that from that period on I switched from uncertainty t' def'n't' actions. I was afraid, of course, and uncertain many t'mes. But I was on your side. G: This w'll all be considered. S: I uncovered IONCHENKO to the Turks. I called from the telephone booths. Some meetings were postponed. Later, at the command of the General, I supported the meetings with the Turkish agent. I saw the surveillance. All this built up and IONCHENKO was expelled 'n three months. Who gave the leads? I d'd!

(22.) S: Before my departure on 4 November I telephoned that the manual was stolen. Was there such a call? The Turks know. It was recorded. You know! Let them tell you that there was a call on 4 November. I was t'ld (in English) when I called, "Mister,

please come in and we will talk with you. (In English) I said, "Okay, okay!", but I had a ticket in my pocket already. I left via the East. If PEEKE had been there at the time (I would have contacted him); I was afraid to talk to the other one. The American Air Attache was new, a Colonel, and I was afraid to talk to his assistant, despite the fact that I had good relations with them both. I was afraid. I trusted PEEKE. If PEEKE had been there then, and in charge, I would have asked him to "give me the address for future contact".

(23) S: Later when I knew everything that was happening in the Kremlin, I went out toward the BALCHUK. For some reason I was drawn there. I had the inclination to approach the West. I knew foreigners who were staying there; that is tourists. I thought I would stop them and tell them what the situation was in the Kremlin. What was happening! What a struggle! G: You can be sure that everything that happened before will be taken into account.

(24) S: When I come over to you, I would like to live decently. Will I have the right to live my last years in such a manner? G: What is even more important you will have a financial base with which to provide yourself with a house, car, etc. More important, you will have a good, honest, and worthwhile work with us. S: I will give all my strength to this, all my faith. If you have this system of payment, then consider that I have worked actively for you for two years, for two years. Then allocate my earnings for two years at the monthly rate. Everyone must have his own. If I had savings in the bank then I would say that I don't need anything.

(25) S: This is secondary to me, believe me, but I also have to provide for my family and myself. All I am concerned with is whether I shall be able to do this? G: We understand and sympathize with your views. S: I want to earn this; I don't want a gift. Don't say that (Subject's true name) is a good person, let's give him ..." whatever it is. I don't want this. I want to earn what I get. H: Very well. S: I did not say to you -- Here is one rocket, two. This is a code. This is something else. I gave everything! I am willing to work with my heart, soul, head, health and strength. G,H,&J: We understand your views. S: These are my views on the matter. Please excuse me for putting it this way. H: It is alright. S: I am thinking of my future. You are very nice now while talking to me, but maybe you won't be here. That is what I am afraid of -- maybe you will be transferred. H: No, this won't happen. Never! G: This will not be. S: Then I will not detain you. I will go to dinner. Am I in your good regard now? G: Yes. S: I swear by my mother, child, conscience, my brain, my heart -- that you will have an even higher opinion of me -- about ten times higher. G: Then you will be here at 2100

hours. St Yes, and we shall work. But I am not saying goodbye.
(Subject left at 1545 hours on 1 May 1961.)

Meeting #12, London, England, 1 May 1961

1. (Subject arrived at 2112 hours, on 1 May 1961, at Room 360, Mount Royal Hotel, London.) S: Good evening! G: First of all take down [redacted] address. S: And his telephone number? H: [redacted] The telephone number is [redacted] S: I understand. (Copies) Well, shall we work some more to celebrate the 1st of May? (All laugh). In the Kremlin, on 1 May, they invite the cream of the crop. The same ones are invited all the time, the Ministers and wives, the Party, the Marshals, one or two workers from the plants (laughs).

2. G: You have not determined when your meeting with the RESIDENT will take place tomorrow? S: No, it is the day after tomorrow, on the 3rd. Tomorrow (at the Soviet Embassy 2 May day celebration) I will attend the movie. There will be a few drinks. It will end at 2200-2300 hours.

3. S: I saw WYNNE, after talking with you. He invited me to a nightclub tomorrow evening -- with your permission. (All laugh). He said, "Very expensive", but that is okay. G: That is necessary. S: A big nightclub! One should go once. G: Of course. J: And you are not going to take us with you?! (All laugh) S: If you like.

4. G: Do you think you can come over tomorrow during the day? S: Yes, of course, but I do not know exactly when. G: What is your program? S: Tomorrow we visit FERRANTI and another place. WYNNE told me. This is very interesting. That takes place in the morning at 1000 hours. He will come at 0915 hours. We will have had breakfast by that time. I think we will return circa 1700 hours. G: Well, since you have to go shortly to the Embassy, maybe you can come earlier. Only, ½ hour, if you can. S: And maybe we can do everything even at 1600 hours. We will try. Wait for me after 1600 hours, at 1630, 1645 hours. G: Of course. Don't worry if you are ½ hour late; that is okay. S: Okay, after 1600 hours. G: That is Tuesday from 1600 hours, and for ½ hour or an hour, because he must go. He needs to wash, shave, etc. in order to go there properly. S: I can't go dirty. G: Okay, no longer. So ½ to a maximum of one hour. S: That is the 2nd. G: Okay. Then the 3rd, Wednesday? S: The 3rd. On the 3rd and 4th, my people will be at the exhibit. The exhibit closes on the 4th. I won't hang around there; I have nothing to do there. I will take them to breakfast and to the exhibit. Then, I will direct them what to do. Later, after the exhibit, they will go to the Embassy, where they will work -- write, consolidate all the cataloging. So on the 3rd we work "seriously" --

APPROVED FOR RELEASE
31 MAR 1992

according to time. G: Yes. S: The 4th!

5. G: Wait! Can you come over on the 3rd in the evening at about 2100 hours? S: Of course, definitely. G: Let me write it down -- 2100 hours. There will be a surprise for you, the Big Man. S: On Wednesday? G: Wednesday. We need a definite answer regarding this because it would be awkward, to be honest... S: Of course, it can't be otherwise. G: That is why I wanted to clear it up. S: This is all most important for me. G: If it is inconvenient for you, or you are not sure -- it is better to do it right. It will be very awkward otherwise. S: There is no question about it. There is nothing to talk about. I will be here. G: Exactly.

6. G: On Thursday, can we also plan to work? S: Thursday also. G: Fine. On Thursday, from the organizational standpoint, we want to make a final check of all commo arrangements, find any unfinished things that might show up in the conversation. We want to review everything carefully, and have you take all the things that we are giving you -- the little transistor, the little camera, the film, etc. S: Papers. G: ,Yes, operational papers. S: Give me lots of film. G: Yes, you will get it. You will seal them up Thursday evening in your (room), so as to eliminate the risk that something might happen on Friday. So that you have it. On Friday, we will meet anyway. S: We will meet daily, but will set the next time every day. Is that what we decided? G: Yes.

7. G: On Friday, we will have a friendly relaxed meeting with a few drinks. We will talk over all the details and will clear up anything that might arise. We will review with emphasis on what are to us the main things of interest. It is not mandatory that everything be fulfilled, but if the opportunity arises... S: This will definitely be done. I'm a little inventor, I will invent! (laughs). Then I will send it to you. G: You will do everything you can, but within the limits of your opportunity. S: Okay. I will have personal letters to pass to you, about information, military matters, political matters, personal matters, advice, etc., and you will let me know orally, or in writing -- typed on a Russian typewriter. Please have it in Russian so I don't have to burden myself with translations and to avoid meanings being confused. G: That is clear. S: In the form of directional-instructions. G: Of course, that is clear.

8. S: On the 5th, we hug and say goodbye. G: Exactly. G: Too bad it is so! (All laugh). G: Fine, this is settled. S: I wish I could come to this side sooner. Maybe the trip to

Canada will work out. It would be very good, in about three months. H: In three months? S: I think so, maybe 2, 2½, 3. I asked you once when I should plan to have my vacation. I will see how it can be worked out with my trip to Canada. If Canada works out then I will postpone it until late Fall. I will go to the South, where it will still be warm. Well, in general, I will keep you informed about everything in writing.

9. G: Regarding the vacation, our advice is not too important. Your opportunities should determine this. S: I'm tying this up with the arrival of WYNNE. G: We don't have any definite (dates) when you should take your vacation. You should rest. It would be good for you. S: Now, let's say something happens to WYNNE. He becomes ill; he is hit by a car. Please think out by the 5th, who will contact me then; where we should meet, the two recognition words. What are the arrangements regarding this girl with the child? H: Yes, we will prepare all this. G: Okay. Instructions will be sent to you through the dead drop? G: Of course. S: The dead drop works well? G: Yes, fine.

10. S: Now to check the sites. The signal site will remain the same? G: Yes. S: Don't let it bother the person if the telephone is not in the booth, on the board. The board is nailed there. G: And they are converting the machines/telephones to the new coins. S: Correct, and then the hooligans cut them (the telephones) off. G: Clarify this. What do the hooligans do? S: When the hooligan cuts it off, he takes off the (telephone). The apparatus (telephone) is there, but not the receiver. Despite the fact that the receiver cord is covered with a metal sheath, it is cut anyway -- hooliganism! G: But later it is fitted with another? S: Yes, later, but the board (SHCHIT) remains there, despite the fact that the (telephone) is ripped off. The person should mark the line with a thin red pencil. In two minutes I will be at the dead drop! (laughs).

Atomics — Control of Stockpile — R/M.

11. G: Okay, fine. Now let's start from this. We have a few questions. The list is getting shorter and shorter. The first question is about atomics. The question: Do you know what authority -- through which departments -- actually has control over the locations where the stockpiles are? Who is in charge? I'm not asking where they are located, but who is in charge of this? S: The finished atomic weapons -- warheads? G: Yes. S: Fissionable atomic material, that is not in warheads, is under the control of the Main Atomic Commission, just like yours. They control all fissionable materials, and raw materials. The situation with raw material is bad. It is not accidental that such

interest was shown in the Congo. Almost all the high grade ores from Czechoslovakia have been removed. There were hopes that China would supply them but I don't know. The question is being settled with China now. Monazite sands had been found in China. The Czechoslovakia supplies were meager. The basic supplier has been Czechoslavakia, and also our own. There are Monazite sands within the territory of Russia, with a varying percentage of content, also other radioactive substances.

12. G: Where did you hear that the situation was bad? S: You want the source? G: How well do you know this? S: I heard this from several places. First of all, when I attended the courses. We asked the instructors questions; we were told about the strategic raw material but we were not told exactly how much is produced -- because it is none of our business. But from the standpoint of what we have and what the People's Democracies have, Czechoslovakia is in first place for production of Monazites. China has Monazites and we have Monazites as well as other fissionable materials. The Congo has a lot. KHRUSHCHEV's feelers were sent there at once in order to get everything possible. You know, an awful lot was thrown into the Congo. When KASAVUBU was still not in power and Patrice LUMUMBA had a very shaky position, LUMUMBA gave his consent and 28 planes with generals, officers and arms were sent via Egypt and Sudan to Congolese territory. A small airport in the Sudan, next to the Congolese boundary, was mentioned as the refueling station for our planes. It was impossible to fly by any other route because no one would permit us -- grant permission to land or refuel our planes. Twenty-eight planes -- IL-14's and several IL-18's, no others, no fighters, heavy planes, etc., mostly IL-14's...

13. S: Major Aleksey GUR'YEV, who was my interpreter in Turkey, flew there with his group. I showed him to you here (his picture) -- his wife and children, Kolya and Zhenya. GUR'YEV is working in the Information Directorate now. He knows Turkish very well, and French quite well. When the Minister of Defense receives the Turkish Military Attache or someone similar in Moscow, he is invited. The Minister and the Chief of the General Staff invite him, a major -- despite the fact that there was a big scandal with his wife. For things of this type, we kick people out of Intelligence. They try to get rid of the person as they consider that the family is not stable. That means he has no prospects. But because he is clever and knows languages he is kept on...and this is what he does. He flew down to the Congo and he told me everything about the Congo. He heard what attempts were made by the Soviet Government, and further what the orders were -- to establish themselves there and grab, first of all, all the fissionable raw materials that are located there. This was the primary goal

because the fissionable materials there are of a very high Uranium content. There is no shortage of raw materials for the production of atomic energy in the USSR, fissionable pure elements. But they are looking ahead and know that the reserves are not too large. That is the general situation as I have heard. Where did I hear this? From GUR'YEV and the Academy the instructors told me. I believe I spoke to Andrey Tomanovich PASOLOV (Phonetic) about this; he also added something about this. I did not speak to Sergey SERGEYEVICH about the raw materials; there was no need. I did not use my initiative to discuss this.

14. G: And who controls the finished products? S: All the elementary production is controlled by the given commission. I already explained this. G: That is clear. S: Now they say we have to produce so many (war) heads for certain rockets. I told you about the Kiloton -- and equivalents of TNT. These begin with S kiloton, and higher.

15. S: This matter then goes to the GAU, to ZHDANOV. G: The GAU! S: I repeat, the whole soul of the technical aspect, the stockpiling of finished products for separate components, is what I have in mind. Empty warheads, and the contents that are to be put into the warhead, all that is for the Army and for strategic purposes also. Because ZHDANOV works for MOSKALENKO, as he worked for the late NEDELIN, he has all this. All the bases are centralized and the security is centralized. ZHDANOV is proved with security battalions by our Army men, plus OMSDON Divisions (DIVIZII OSOBOG NAZHACHENIYA). In addition, there are KGB units. It is considered that all sites of national importance are always guarded, not by regular troops (RYADOVOY SLUZHBY) -- we have such guard battalions, guard companies, guard platoons, depending on the size of the site. They must be guarded by the KGB. They are attached to us.

16. S: I don't know if you happened to get the film of when the Soviet tested their first atomic bomb. They made a film. It showed how they wheeled the armed atomic bomb. On the sides, there were two officers here and two officers here, with pistols. Soldiers are there also, drawing the cart; a Willys-type vehicle towed it. We mentioned it someplace, a light vehicle copied from your Willys, a light GAZ-63. It has a wider axle than the Willys. G: Of the jeep type? S: Exactly -- of the jeep type, and sometimes they put on a truck body for carrying light loads. Such a vehicle tows a low cart with 4 dual rubber wheels. It tows it slowly to the airplane. This film was Secret, of course, and was not shown to everyone. This was the very first, when the atomic bomb was in its

first stages. They showed the woods and birds; they showed a huge cross that was laid out (on the ground), a circle and a cross in the circle, to mark its bomb target. The error was insignificant. The guidance was dual. The pilot pressed the lever to drop (the bomb) and a radio signal was given from the ground -- the corrections. The pressing of the lever by the pilot was not all. The bomb did not fall. Only when the calculations on the ground were exact, did the bomb fall from the airplane. The airplane was at a great height. The bomb fell close to the target. At various distances from the epicenter of the explosion starting from 2 km, they had motor vehicles, airplanes, tanks, also animals tied up -- horses, dogs, cows, sheep, etc. This was all echeloned in several rows, also a complete array of structural buildings built in the genuine manner. They studied the degree of destruction. Everything was studied scientifically in all respects, using all possible methods and equipment. This was done for the whole area up to the points where only radiation was present. In other words, the parameters of damage created by the explosion were studied, the atomic action, and the power of destruction. G: Who told you this? S: I saw the film with my own eyes. Victor spoke and explained everything. Everything was shown. There was no music or sound. They showed everything.

17. G: Was this at Frunze? S: No, at the General Staff. I was still working at the General Staff, when they dropped the first atomic bomb. That was before I left for Turkey. G: That is clear. S: There was this film. All the other atomic tests were filmed also. I think I saw two more films. I think a total of three films were made. Then everything was explained to me. Here there is death; here if humans are well protected they can survive. There are three categories of radiation illness. At this distance, if you are poorly protected, you will have radiation illness of the 1st category -- there, it will be the 2nd category. It is even possible at this distance. If one goes further underground and makes reinforced concrete fortifications for the full profile, the radiation will be insignificant. They showed all the devices and indicators that are used. I saw this training film.

18. G: But who controls, not the equipment, but the actual atomic weapon? S: ZHDANOV gets everything. It is ZHDANOV's responsibility to conceal everything according to strategic directions. I know definitely. VARENTSOV personally confirmed this. I will swear to this.

19. S: There are two separate underground atomic stockpiles on GDR territory. I know this "exactly", like 2x2 4 -- two stockpiles, two locations. But I don't know how many warheads there

are in each but, of course, it's not one or two. They are held in reserve. The command will be given from the Presidium, from the Commander in Chief. There is a curly-headed Commander-in-Chief, without a single hair on his head, or anything in his head. (laughs). From him to GDR and that's it. Similar stockpiling exists on Soviet territory.

20. G: Who is in charge of this stockpiling? S: I'm telling you -- ZHDANOV. G: The materials and the bombs? S: No, he is in charge of the warheads and the bombs. But they are not armed. G: So he controls the bombs also! S: Of course. That is part of the equipment. G: What exactly does he control? S: He controls the safekeeping, the technical supervision, the maintenance, the technical-engineering control. How is stockpiling conducted? Is there any radiation? Is there deterioration of material from the engineering standpoint? To use or to issue to someone in a brigade, because he wants to, is prohibited. Only the Minister can do this. The Minister is told by the Central Committee. The Minister will act through NEDELIN (means MOSKALENKO). What concerns the Ground Rocket Troops will be through VARENTSOV. ZHDANOV stores. ZHDANOV's dumps are controlled by the KGB. ZHDANOV had "neighbors" sitting all around him. The security of these Atomic installations is maintained by divisions of OMSDON. ARTEMYEV was in command of one of these Divisions.

21. S: This is the structure. No one can do anything independently. VARENTSOV can't demand to get one bomb for use in maneuvers. No, it has to originate in the Central Committee. G: What do these letters mean? Why is it OMSDON? S: This is DIVIZIYA OSOBOGO NAZNACHENIYA. OMS is just added by them. I never asked. I will find out about these three letters. It is not read DON-OMS, but OMSDON. I will give you the exact full name; I never paid any attention or I forgot it. They guard the Kremlin, Lenin's Mausoleum. G: Yes, yes. S: There was a military school in the Kremlin, in the name of KALININ. It has been removed -- an infantry school. There are no schools in the Kremlin now. A Honor Guard Regiment of Artillery (SALYUTNIY POLK) was stationed there. It was removed. During the war, it was there. Your obedient soldier was almost appointed Commander of the regiment, upon graduation from the FRUNZE Academy. It was stationed in the Kremlin. I was in the Artillery and a former regimental commander, and was a good student at the FRUNZE Academy. Then they began to cut things down and I was assigned to the Ground forces.

22. G: To what extent does the responsibility of MUSKALENKO and VARENTSOV go into the rocket program? For example, you said that development and all scientific research groups are coordinated at GAU. S: The NIIs? G: Yes, the NIIs. Does the responsibility of MOSKALENKO and VARENTSOV reach the plants? S: Yes, it reaches to this extent -- the Director of the Plant is responsible to MOSKALENKO, if he produces rockets for him, to account for the fulfillment of the plan. But neither MOSKALENKO, VARENTSOV, nor the Minister, can order the Director of the Plant to do anything without first contacting the civilian authority in the Central Committee that is concerned with this. Their job is to take delivery; the plant is the supplier. That is, to fulfill functional responsibilities. He doesn't have the right to come to the plant and say, "This is a mess here; the men are not working." Or, "You are not fulfilling the plan." You have to report to the Minister, and the Minister will report to KHRUSHCHEV or his Deputy, whoever oversees this plant. This is the way members of the Presidium are placed in controlling positions. When BERIA was alive, he was in charge of all the rubber industry, in addition to his KGB functions. He was also in charge of all plants that produced tanks, rubber and explosives. Other members were in charge of other heavy industry plants. The Minister and everyone was subordinate to him. While the Supreme Soviet of Ministers met, these members of the Presidium, this head, was the highest Politburo. Now the Politburo does not exist as such, but the system is the same. They (Presidium members) all have 4-5 Ministries in their hands. They can make the Ministers stand on the carpet, remove them, sit them down, kill them, do anything they want. The member is responsible to the Presidium for his 5-6 Ministries; that is the functional breakdown. G: That is clear.

23. S: BREZHNEV does even more now. He is responsible for many of the defense enterprises. In this way, any big question is first referred to BREZHNEV, not to KHRUSHCHEV, BREZHNEV reports on this to KHRUSHCHEV. That is the way the "heads" work. The "heads" are constantly in conference discussing some cable from the agents. They decide where and how. They are constantly in conference and by telephone they give orders through their assistants. Sometimes the Minister sits there for days on end; he has his own office. G: I understand.

24. S: I remember this case. I was invited to the Kremlin to the Party Meeting (AKTIV) when ZHUKOV was relieved. At the Party Meeting in the Bol'shoy Georgiyevskiy Hall of the Kremlin, they got 2,000 military persons together. It is necessary to

come to an understanding with us so that we would applaud (applauds). "It is right that ZHUKOV was relieved!" It has to be supported so that it can be used in the newspapers and speeches later. At the entrance to the central hall, in the corridor of the Bol'shoy Palace, they exhibited the large painting of ZHUKOV on horseback. You probably heard of this. G: On a white horse! S: He is sitting on a white horse in full uniform, and under the hooves of the horse are the fallen Fascist colors with the Swastikas. It is very well done. When the war was over, ZHUKOV had actually done a lot to defeat Fascist Germany; he did an awful lot. The artist was inspired by this. Paintings of SUVOROV and KUTUZOV were displayed -- why not one of a 20th century notable by GRABAR' and another artist! A very beautiful canvas, higher than this ceiling, a beautiful frame, everything. When they painted the picture, it was said that it was fitting and that ZHUKOV deserved it. He got his fourth Hero's Star. He was given everything. Why did KHRUSHCHEV pick on him? If you remember STALIN relieved ZHUKOV because he feared an army uprising -- not the whole army, but let's say 80% -- 75% for sure, well 80%. Some said 90% would have followed ZHUKOV. I will tell you now how this took place. I heard VARENTSOV say this and I also heard it at the Party meetings. He (KHRUSHCHEV) said, "By the painting, you will see what a personality cult he has. A shame!" Before this he said it was right that the painting was made, and the painting was hung in the Central Building of the Soviet Army. Everything was as though it was proper to have a painting, in color -- a national hero! And then the personality cult was brought up. If he was a modest person, he wouldn't allow the painting to be done. He said, "The painting cost about 20,000 (rubles)." So what? They could have written ballads, poems, plays about ZHUKOV just as well. This was all a put-up job reshuffled for this meeting -- first, to relieve the man and put him to shame, and to undermine his authority. So, the Minister, all the Heads of the Directorates, Chiefs, of Staffs, were at this meeting (ARTIV). The Minister gave his report. He just started to report, when someone came and whispered in his ear. He left and was away for an hour. Then he returned and sat for a while. There was a buffet -- mineral waters, fruit, everything! Then the top man -- the brain -- arrived, and the whole matter was discussed and the accusation made. He said, "Please excuse me, comrades, that I did not work with you all the time. I was called 'into the government' (V PRAVITEL'STVO)." The government, however, was right there, in the Kremlin, next door to where they confer.

25. S: So that is their functional breakdown. There is no one person who can sanction the use of atomic energy, the movement from a stockpile to somewhere. Everything is centralized. The bases are scattered all over the country and the GDR and there are prepared warheads. This has to be investigated. I think that in Germany it can be done easily. Maybe I'm a fool, but I think that it can be done. G: And the Scientific Research Institutes, as you explained, will be GAU. S: GAU is the brain of Scientific-Technical thinking. The Academy (meaning Dzerzhinskiy) is also a brain in its own way, in the GAU. Highest Scientific Cpuncils -- there is a scientific council at the Academy. It is composed of the doctors, candidates, professors in the military and all fields -- optics, electronics, equipment, guidance, supply, etc. G: This is under ZHDANOV also? S: No. I am speaking about the Academy now. The Academy is under ODINTSOV; but it is subordinate to MOSKALENKO because it prepares cadres for him. There are no barriers or walls between scientific thought; it all flows into one source, as I say. And the Scientific Research Institutes -- not scientific research institutes in general, but Scientific Research Institutes for Fuels, Scientific Research Institute for Electronics, NII, NII -- all work according to their specialty but for one large purpose. G: I understand. That is the way you explained it to me.

26. G: Everything is coordinated by the Committee which sits in at GAU. Who is in charge of it? S: The Chief of the GAU is automatically the head. G: So it is under ZHDANOV? S: Under ZHDANOV! G: That's clear. That's fine if it's ZHDANOV. S: But, when necessary, VARENTSOV gets mixed up in it. G: Yes. That's clear. S: He could say, "You were given a certain matter to work out and you are dragging it out." or, on paper, "You worked it out well but in practice it doesn't work, or it works out with mistakes." You see, they all participate in all these discussions, conferences, meetings when necessary. But to start off, it's the scientists. These Germans that are in the suburbs of Moscow. They work also; they are invited; they are consulted, developed. Maybe they do more and just finish up there, because they developed the V-2 rocket which is the prototype of all the rockets.

27. G: Now, going beyond the scientific people -- who builds not only the launching pads but the foundations, etc.? S: I understand -- the Chief of the Main Engineering Directorate. G: Only he? S: He has the Kuibyshev Academy, which prepares engineering cadres and fortification specialists, who are subordinate

to and available to construct everything needed for the rocket command. G: That's clear. S: They also prepare fortification specialists for other underground defense sites and also engineering cadres for mining, mine clearing, for making passages (roads), etc. All types of engineers needed in combat. All cadres are prepared there. The biggest department there is this one (for rocket base construction) -- the one with all the new requirements. G: Correct.

28. S: So the Chief of the Main Engineering Directorate is Colonel General of the Engineering Troops VOROV'YEV -- I don't remember the initials. Under his control he has the Academy, a NII, his own ranges (POLIGONY) outside Moscow. Like the Chief of the Chemical Directorate, he has his own ranges. I will tell you where the chemical one is; I was there twice. There they put a rabbit and other animals in a metal box for tests. G: In Moscow? S: Outside Moscow, very close. G: This will be VIEM? S: No. G: ...the All Union Institute of Experimental Medicine? S: No, this Experimental Medicine is under Colonel General GRIZHOV. I am talking about straight chemistry -- pure bacteriology and pure chemistry. I was at this range twice. It is about 30 km outside Moscow. There is a small populated area in the woods. When you drive up, it stinks of IPRIT gas. There are yellow spots on the grass. There is barbed wire along the road, guards, patrols -- even cattle cannot enter. They put a rabbit in a glass box and give it one dose (of gas). The rabbit shudders and dies. They give another type; the rabbit shudders and then dies. We were shown all these gases.

29. G: Do you know what gases they are? S: No. G: Nerve gases? S: We have all this. But the evaluation of gases that you asked about...the best American gas, which is ordorless and colorless, is very highly regarded as a tactical gas. G: You are thinking of Lewisite? S: No. J: Nerve gas? S: Nerve, yes. G: It is highly thought of? S: It is highly regarded but we don't know the secret of (this gas), but we know its tactical properties. Maybe not all, but some of them. They say that the Americans have a tremendous gas -- colorless and odorless, excellent for tactical use. That is the evaluation they give it. G: Yes. S: There is one gas -- I won't answer now as I have some materials about this. By the way, they are not secret. I will tell you what gases they are.

30. G: Is there an intention to use gases in case of war? S: The 7th Directorate of the General Staff, the Main Chemical Directorate, has the Academy of Chemical Protection in the name

of VOROSHILOV, Military-Chemical schools, Scientific Research Institutes. They prepare cadres, both chemical and bacteriological. G: They are joined together? S: Yes, one command and one management. The cadres are also one. The Institutes are separate. G: Do you know where the Center is? S: All the Centers are in Moscow, but the experimental Centers are... One is on a small island in a swampy area of the Volga, beyond Kalinin. G: You don't know the name? S: They said there is a small island... G: Oh, yes. When you were at Kalinin, do you remember seeing the huge stocks of chemicals. They were there during World War II. Are they still there? S: When I was in Kalinin, when the Academy of Rear Services was there... G: Across the Volga from the Academy.

31. Here is what I will tell you. There are Centers in general, all around Moscow, in Kalinin and especially Kaluga. G: Kaluga, yes. S: There is a big base there and the brother of Sergey Sergeyevich VARENTSOV is the Chief of the Base in Kaluga Colonel Nikolay Sergeyevich VARENTSOV. Two brothers. Sergey Sergeyevich lives in Dmitrov, and their old mother lives there, 60 km from Moscow. I go there often with him. G: Where is this? S: Dmitrov. He is from Dmitrov, His mother lives there in a house, 60 km from Moscow. It is in the direction of our atomic center where they take scientists openly, where the first atomic station (ATOMNIY BLOK) was created at Dubny. Dubny is beyond Dmitrov. I was at Dubny once. On Sundays, I often drive out to (Dmitrov) with VARENTSOV to see his mother; he gives her 500 rubles every month. We take produce out to her. There is a nice garden there. We get a good meal, tomatoes, etc. There is a museum there.

32. S: His brother is a colonel like me, but a colonel in the engineers. He fought on the First Ukrainian Front with me all the time. G: What base is he Chief of now? S: Chief of the Kaluzhskaya Base, subordinate to ZHDANOV, a huge base.

33. S: But now to finish what I started -- beyond Kalinin, there is a swampy area. G: Yes, yes. S: I was told this by my late father-in-law, GAPANOVICH. G: That is considered to be the Moscow water storage area? S: The water storage area is in the direction of Dmitrov. I am telling you about Kalinin, about the chemistry. You are correct, the water storage area is huge. There are all kinds of water overflows, sluices. A canal passes through there. Now to finish, there is a small island (OSTROVOK). The Volga flows around it. It is like my living on an island in the Moscow River; there it is the Volga river. The (island) is covered

with woods and there is a barbed wire fence. All the little houses, offices, and all the containers with the bacilli, and the various inducers of plague (CHUMA), etc... G: That is clear.

34. S: I want to finish about the brother, Colonel Nikolay Sergeyevich VARENTSOV, so that you will know everything. He is a nice, modest fellow. He is older than I am, about four years. He is about 46 years old. He married the mistress of VARENTSOV. VARENTSOV had a mistress at the front and one day, when he was sleeping with her, his wife arrived early in the morning and found them in each others' arms. It almost ended in a divorce. VARENTSOV's brother liked the girl and married her. She was pregnant at the time. She gave birth to a girl, who is actually the daughter of Sergey Sergeyevich. (laughs). S: He had two more. So there are three children now. G: It's a family affair! (laugh). S: In general, he is very nice, I was at his DACHA, the last one. He wrote me a few things. I even have a photo, which he signed. He likes me very much. G: But you don't need to send the photo! S: I will send it to you. (laughs). It won't take a lot of room in our mail. (laughs). I will ask you to study it well, make an enlargement and a portrait. (laughs).

35. So modest Nikolay arrives. He says he had an accident, a soldier got tangled up in mines and a high tension mine fell down and killed him. As a consequence, there was unpleasantness, ZHDANOV came down and chewed him out. ZHDANOV does not like VARENTSOV and VARENTSOV does not like him. When ZHDANOV had the heart trouble VARENTSOV said, "The least he could do is retire". I know ZHDANOV personally. I sat with him like I am with you now. I will be bossing everyone around on September 2nd at VARENTSOV's birthday party. What I need is a microphone so that I can hear everything. A very miserable looking little colonel came down with ZHDANOV; you know the expression POMESHCHAL NA NEM (to report on him). Well, he did not take anything down. Nikolay Sergeyevich had a small fire, just recently.

36. S: By the way, I have another good source. In Mozhaysk, we have a huge artillery base. There is a Captain Yevgeniy Mikhaylovich SKLYAROV who works there. You need the name and patronymic? G: Yes, please. (laugh). S: His wife, Valya, works in the Main Military Publishing House. In Turkey I had a stenographer-typist, PRONINA, from the embassy who helped me. The wife of GUR'YEV was the stenographer-typist, but when she was sick sometimes and also when she went to USSR, Tanya PRONINA helped.

She was an M.I.D. worker.

37. S: There was a Shura ANDRIANOVA there who is working for PODSEROV now. She is his mistress. Whenever PODSEROV flies someplace, to you especially, ANDRIANOVA always goes also and sits there for 2-3 months. But this is Tanya PRONINA, also an M.I.D. stenographer-typist, who helped us. When I returned from Turkey on 25 January it was the namesday of Tatyana and she invited me over with my wife. She lives close to Pushkinskaya Ploshchad.

38. There I met the SKLYAROVs, husband and wife. SKLYAROV is such a fool. We participated in the Hungarian affair and received the Order of the Red Combat Banner (ORDIN KRASNOGO ZNAMYA BOEVOGO). He was a tank crew member, but from the engineering end, in the armored forces. Before this, before Hungary, he was stationed in the city of Vozh. Vozh is in the Turkestan military district, on the border of Afghanistan. When the war, the events, ended in Hungary he was recalled. They drowned everything in blood and then removed the tanks. He was sent to Vozh again. He is such a nice modest fellow. He said he was stationed there before, but he went to Vozh anyway. This one (Tanya PRONINA) started pestering me -- "Please help my girl friend and the girl friend is not bad." I'm also sorry for him so I help. Good women should be helped! (laughs). S: I said a couple of words and he was transferred from Vozh to Mozhaysk.

39. S: There were no vacancies in Moscow; it is hard to find a job in Moscow. But I have so many friends and I have connections with VARENTSOV and others who work there. Often people ask me; I have had many requests from friends because we have a simple relationship. I help them but demand the same attention for myself. If someone is not nice to me, then I can tear his head off. There are my morals and my personality. I am respected, I am known for this, and people are very afraid of me.. They respect me.

40. I said two words to the personnel man and he was out of Vozh and in the place where he is now. He is bored with being there. He has been working there more than two years. He wants to be transferred to Moscow, his mother died and left a large room on Armyanskiy Pereulak which he wants to get from his stepfather.-- his father is not alive -- who wants to grab it and get married. But he is registered (PROPISAN) in Mozhaysk and Valya is registered in Moscow. Valya, his wife, is the daughter of a retired artillery

colonel who worked in the Artillery Academy and lost his job recently. He has a small apartment on Gorkiy Street opposite the telegraph office. This is an interesting thing -- why am, I mentioning this? This captain tells me everything.

41. S: When I was getting ready to go to England I met him. He said, "(Subject's true name) will you transfer me someplace?" I said, "There is nothing in Moscow now, my dear fellow. Sit and wait, there is nothing!" It is not easy to get him into the Academy. I offered him the slot of chauffeur in Turkey as driver in Istanbul -- as head driver and instructor. The personnel people upheld me. He passed the Central Committee and KGB (security) checks. He received a perfect score (5). Everything was okay regarding the relatives and all that. Then they looked and could not send him abroad. He does not have a mother or father and eight years ago, in 1953, there was a case of drunkeness. They are keeping him in mind but are holding up his processing for an (exit) visa to go to Istanbul as a chauffeur for our Strategic REZIDENTURA. I tell him, "You are a fool! You see I do everything for you, but am I responsible that you don't have a mother or father? So sit and wait. If I have an opportunity, I will transfer you."

42. S: (Note: Subject is quoting SKLYAROV) "(Subject's first name and patronymic)! I recently had an unpleasantness." "What?" "There was a fire." "Why?" "A shell exploded." It killed two civilians. They were cleaning with brushes and it created a spark. Apparently they were steel brushes -- a regular shell, not an atomic one. Two were killed and four wounded. A small fire occurred. The system is as follows: The cells (rooms) where work is done with ammunition) are isolated from each other by thick walls, so that a fire or shock will not spread. This occured in Mozhaysk where our Captain SKLYAROV works. G: This is very interesting source. S: Yes, I can describe many more. I will write them up for you later. I can simply ask how is everything? What is new? They know that I know more about work than they. They feel very lucky if they can tell me something also, and then they trust me -- without a doubt. Captain SKLYAROV, a nice fellow.

43. G: Does the General Headquarters Reserve (REZERV GLAVNOGO KOMANDOVANIYA) still exist? S: The RGKs are units that are created in wartime. But now they have the following subordination. They are centrally subordinate. Everything that we consider to be centrally subordinate is in the hands of the Minister and Chief of the General Staff. This is actually the basis of RGK. But they are not called RGK now.

44. S: What is the General Headquarters Reserve? There is no reserve; everything is from the General Headquarters. When there will be a deployment to fronts, for operational purposes, then the fist of RGK has to be held directly. But in the case of battle readiness these candidates will remain in the reserve which will be used to strengthen one or another strategic area, a front or army. So there are installations and units that have special units (SPETS CHASIT) within their organization. This exists and is in the hands of the General Command, but they are not listed as such. It is not said that you are serving in RGK. You serve in the Army but your assignment is such in case of battle readiness.

45. G: Yes, who are they subordinate to now? S: They are subordinate to...G: To the OKRUGs? S: No, by territories. That is a very good question. What is located in the territories of the OKRUG, from a garrison standpoint, is subordinate to the Commander of the OKRUG. He is responsible for the supply of food, uniforms, fuel, etc. to the garrison. But directives regarding battle training, the closing down or reduction in size of the units, came from the General Staff in Moscow. (The Commander of the Military District (OKRUG)) is responsible for discipline, parades, etc., and the garrison commander has to obey his orders.

46. S: But the commander (of the Military District) can't order a battalion transferred or relieved, nor can he criticize or supervise training. He does not have the right. He is (in charge of) general administrative supervision, and concretely it is the General Staff. These units exist all over the Soviet Union, they exist in all Military Districts but they are not Military District (units). They are centrally (subordinate). Military District commanders are given several brigades for their division. They have to train them and be responsible for everything. The commander is responsible for order in the RGK units but cannot command them. G: That's clear. Fine.

47. G: When did you first hear that all satellites would be given rockets? When was the decision made and by whom? S: I heard this ten times. The decision was made by the Presidium of the Central Committee of the KPSS together with the political leaders, who often come secretly without anything appearing in the press -- SHIVKOV, KADOR or MADOR. They fly in, are met and seen off, and there is nothing in the press. When necessary they announce it - "The peace-loving Warsaw Pact met!"

KADAR

48. S: They, first of all, have telephone communications and KHRUSHCHEV can talk to them ten times a day. Representatives sit in the General Staff for coordination. If there is the slightest change in the situation, the agent net reports political (information), American or English troop movements, etc. All this is reported at once. It is plotted on maps, and changes are made. Intelligence information is fully coordinated. Intelligence operations are not run against these countries but they teach them how to run operations against the opposition. There are constant political consultations, etc. There was a meeting and it was decided to give rocket weapons. So it is this way. If there are rockets, then there are bases where any kind of warhead can be attached. It can't be separated; it was decided this way.

49. S: I heard this about ten times. G: At the courses? S: No! Today it is two years since I completed the course. I maintain contact with the courses. I maintain a friendship with FILIPOVICH, he lives in the same house as Valya. He is the chief of a course. He is in charge of a VAK which is subordinate to the general staff. The subordination exists because he receives orders to train 50 General Staff officers. He accepts them. But all this is coordinated through VARENTSOV -- MEDELIN formerly -- now MOSKALENKO.

50. S: VARENTSOV tells me this: ("Subject's first name)! I am overworked." "What's the matter?" "New matters!" Really, all the time, he spends 2-3 days in Moscow and then leaves by air in either one direction or the other. He drags BUZINOV with him.-- "BUZINOV, where are you going?" "There! Sergey Sergeyevich is taking me to Poland -- new matters. We have to help our brothers who can do us dirt -- to teach them and give them some things. It is an order from our government!" So, a few fragments from VARENTSOV, and this one tells me in detail: "(Subject's first name), I am leaving for Hungary for two weeks". Why? A new something or other. G: So in other words he was there already? S: Yes. This year.

51. S: And they forecast that by the end of 1961. Sorry, I heard this in 1961, in 1961 in the beginning. The preparation, of course, began in 1960 but not for all countries. I have this in my report someplace in 1960. Germany -- the GDR got them first -- in 1960. In 1961 -- by the end of 1961 -- following Germany's example, set them up in all the other Peoples' Democracies. G: That's clear. S: We are giving rockets to China also, but they are making their own now, according to our specifications.

52. S: Personnel are being trained all the time. There had been a faculty for foreign students at the Dzerzhinskiy Academy. Now it has been removed because there are many secret things, and there have been cases of arrests of the officer students in USSR. I know some Germans were arrested, some Hungarians, and I know one Pole was arrested. The faculty was moved to the Higher Voronezh School at Voronezh. This is in connection with artillery. The Combined Arms part at Frunze Academy has remained there. Officers from all types of units come (here), chemical, engineering, artillery, etc. -- all. G: Of course, a school for all branches of the military. S: Yes, they arrive and have better conditions than our officers. The government gives them an allowance, and here in the Soviet Union they get a subsidy. They live it up. They go to restaurants; they have girls and have money left over. This is just information. This is a very important matter, what else did I want to tell you? Everyone is promised (rockets).

53. S: VARENTSOV visited all the Peoples' Democracies including Korea. He showed me photographs. There is one of him in field uniform, walking along fortifications in Korea. He has these photographs; I saw them. I can steal one photograph from the album and send it to you, as proof. VARENTSOV was in China several times. Whenever Chinese come here they immediately give him two or three big boxes of tea. He loves tea! He brews fresh tea every time he drinks it and uses 50 grams of tea each time. He drinks only real tea. G: Where did you put him up at home? S: He invited me when he worked in Tbilisi and Lvov. He slept with me. I had a wonderful double bed. My wife, mother and daughter slept in the other room. You know, I have 45 sq. meters of area. That's enough for me under the present circumstances. He ate at my house, and KARIAFILI visited me at my home when he was there. Now when I want to celebrate some occasion I invite him with his wife and children.

54. S: My daughter stays with them all the time, either at the DACHA in Babushkino or at their separate apartment next to the PVO of the country, -- the one we will blow up. G: (laughs). S: Because his youngest daughter, Natasha, is the same age as Galya. G: Yes. S: I bought a blouse for Natasha today. When he comes from Czechoslavakia or someplace he brings something for Galya, shoes or something. G: That is the way it should be. S: That is what our relations are like.

55. S: Now to finish this, I may be repeating myself but I will confirm it. It won't do any harm. This is a firm order that the rockets be operational b y the end of this year, 1961,

in all countries. This does not mean that there will be large numbers, that's my feeling, and I can't say how many. I think that, of course, they won't be given everything. To start off they will definitely be given the R-11 definitely because we have very large numbers of them and it is proven. When one knows the R-11 rocket then it is easy to go over to the others, both larger and smaller. The free rockets will definitely by given. In general I want to correct myself. The free rockets will be given first, then the guided ones.

56. S: Personnel is being trained well and very intensively in the countries of the Peoples' Democracies. In other words, the officers whom we trained will teach there with the help of our instructors and teachers who go there for 2 - 3 years as consultants. This is being done very quickly.

57. S: There is a question that I asked and never got a reply to. VARENTSOV did not go to Albania, and I have not heard that any of his artillery officers went to Albania. Because Enver HOXHA turned away from us in the presence of KHRUSHCHEV, when the whole clique met, they said that after TITO the next traitor, an opportunist and (subject can't remember word) -- one who -- Lenin's... Oh God, what's the matter! G: You mean independent communism? S: Well one who preaches Lenin's doctrine in his own way -- Marxism, Leninism. Not a reformist, no. G: One who splits away? S: No, we are all around it but there is a word for it. G: A revisionist, no? S: No. Dolores IBARRURI said that he is the second declared rightist scoundrel in this respect, a deviationist (revisionist), after TITO. And he, HOXHA, behaved very independently there and he departed first. He left his first deputy... a short name, four letters... G: Why did he stay? S: Because Enver wanted to leave. KHRUSHCHEV made the following decision so as not to wreck relations with Enver completely, because this would do harm. G: Of course.

58. S: He was told everything they wanted to tell him. Enver turned it down and departed. They kept quiet, because the others support, and are in the Soviet Bloc. But Albania is only hanging by a hair. Itwants to proceed independently. Also it does not want to joint our bloc nor does it want to be dictated to by the Soviet Union. That's how Enver wants to break away. Despite the fact that Enver is on bad terms with TITO, he has bad personal relations; he has taken his own path. We Marxists, like KHRUSHCHEV think that persons who take their own paths are revisionists and are playing into the hand of the Capitalist Bloc.

59. G: Now I have several questions about the V-75. Can they be used on ships? S: I have not heard. Why do you have it used there? G: I don't know. Is it possible? S: Why? We have coastal armament and we have coast defense troops as part of the navy. They have them. G: Of course, that's a different matter. S: We don't have large units that have to be protected.

60. G: The headquarters will have or already have them to a certain extent? S: For what? G: Where there are large concentrations, etc. S: The V-75? G: Yes. S: The V-75s are in the hands of the commander of the PVO of the country and commanders of the rear areas. In case of war it is different. There are separate PVO units that have these rockets; they are separate units. They can be assigned to the Military District where there is no PVO zone and a PVO zone will not be created. The military zone needs anti-aircraft protection. It will be given, for example, a regiment, a division or two regiments. G: I understand.

61. G: How about in Germany -- do they have them to protect their troops? S: Germany was the first country to get rockets. G: For their own use? S: For their own use, for the Germans... G: So they have them. S: I don't know, can't be that. I have heard that the Germans of the GDR are anti-Soviet and cannot be easily penetrated. Is it really that hard to find out things? I thought that you knew about the rockets through Germany a long time ago, through your agent net. G: To some degree only.

62. S: You should pose this question -- there are four rocket brigades, two stockpiles (of nuclear warheads). Two of the rocket brigades are to receive atomic warheads when necessary. They are trained for this. G: I understand. S: That's exact. The 6th ADD Brigade is there under Colonel FEDOROV. G: Are they found around Moscow? S: They are deployed there, yes. Moscow is very well protected. It's the Moscow zone. G: Have they standard artillery and rockets all tied in with fighter intercepter aircraft? S: Yes, they are all tied in together.

63. G: Now this is interesting. When VARENTSOV said that there was a shortage of electronic equipment... S: And that the electronic equipment is bad. He said so directly. G: Did he ever complain that there is a lack of accurate geodetic maps? This is from the standpoint that extremely accurate maps are necessary. S: We mentioned this. He never said that there are no maps. There are maps -- at any scale. The geodetic tie-in at separate installations (UZLAKH) is not done on maps but on a given plane table (DANNOM PLANSHETE). There are special geodetic

units (CHASTI) which make ready the goedetic preparations in three days for R-2 rockets. G: Yes. S: For R-11 it also said how long it takes -- about the same. This is considered to be extremely bad!

64. S: But the matter is not in the maps, the matter is in the training of the cadres who could do it fast, and the matter is in the branching out of the triangulation net. Triangulation has to be tighter, more points that have been calculated down to the last second by X and Y should be created. This triangulation! G: Yes. S: In some directions there are many triangulation points, and in others there are none. Where there are triangulation points it is very easy to tie up the plane table (PLANSHET) and the location of the rocket, to aim it at the target. Here where there is no triangulation we don't have any order and they check, and recheck, (CHEKUYUTSYA). They establish an agreed upon triangulation net, check it and recheck (CHEKUYUTSYA) for days, day and night without sleeping. G: I understand.

65. S: There was such a case, listen to this, almost unknown -- concerning this. Last year, in 1960, there were big maneuvers in the Transcaucasian Military District, next to the Turkish border. The training was under the supervision of the Minister (of Defense). KHRUSHCHEV came there (to observe). In connection with the visit they had training. They fired rockets to the Turkestan impact area (PRIEMNAYA) like they fire from Kapustin Yar. CHUIKOV, who was appointed already, was in charge of everything and had to report to the Minister when everything was ready. The Minister was to report to the Commander-in-Chief, Marshal KHRUSHCHEV (laughs). MALINOVSKIY says, "Comrades, marshals, generals, and officers! I present to you the Commander-in-Chief of the Armed Forces of the USSR, Comrade KHRUSHCHEV." (S applauds All laugh). S: He (KHRUSHCHEV) nods his head and steps forward.

66. It is awful, all the Russian people suffer from this. When I look at this I say they are lied to, suppressed; they have not seen anything good and do not see anything. They wait all the time. That's the Waiting Doctrine that has been developed now. It's great! Wait! (Laugh) Die and others will wait. Well -- VARENTSOV told me this in detail. Please remember this; it is a very characteristic moment. VARENTSOV became very miffed at CHUIKOV. He called him an impolite scoundrel who used abusive language, the SVOLOCH!

67. S: So the Minister and KHRUSHCHEV are about to arrive. Everything is ready; the troops are deployed. Everything is ready except these points (triangulation) don't exist. It can't be said

that everything is ready to fire at any time. There is an inspection commission to check this. It is not the object just to fire. The object is to train the troops. They said to him, "Are you going to impress?" CHUIKOV is nervous. As long as they are such monkeys, they can't manage to do it. Why drag it out for so long? They tie it in too long and when they (team of Ground Force Artillery) report the coordinates, CHUIKOV checks them through his people. Are they accurate? Who will take the responsibility for inaccurate coordinates? The same thing will happen in wartime? They would be court martialed and dismissed from the Party. (G laughs).

68. S: Everyone is sitting and waiting. The Generals -- they wait and demand. CHUIKOV calls KARIAFILI, VARENTSOV's Chief of Staff. "Well, Colonel general! Are the coordinates computed for firing, ready?" "No, Comrade Marshal. This and that is still to be done." "If I were in your position, I would have provided everything." VARENTSOV then entered. "But maybe you, Marshal, can tell us if the coordinates are ready or not?" VARENTSOV said, "You know, Marshal of the Soviet Union, coordinates are not produced (as fast) as you make pancakes!" (all laugh). S: I saw that he was nervous. I put something on the table, turned around and left without requesting permission to leave. One is a marshal of the USSR, the other a marshal of a branch of the armed forces. CHUIKOV is the important person. KHRUSHCHEV might call him his right-hand man. CHUIKOV is the closer to KHRUSHCHEV, can approach him easier, and circulates closer to him than VARENTSOV who is called up only when he is needed. And VARENTSOV said, "I replied to him: Comrade Marshal of the Soviet Union! Coordinates are not produced as fast as you make pancakes". He fixed him with this and left. (all laugh)

69. S: A lot of effort is going into this now. What is the trouble? A bear and rabbit can be taught to play on a drum and strike matches, but that isn't the matter. The fact is that the matter with triangulation is bad, and therefore they must spend a lot of time. So, as far as I understand it, an adopted triangulation net is formed. It is accurate, but requires more time for complete readiness and complete calculations. More than one point has to be tied in. Many launching platforms have to be tied in. This is the whole trouble.

70. S: Let me again repeat my analysis of rockets -- free rockets. There are large lateral deviations at long ranges. They still can't reduce this to a minimum. In wartime they want to compensate for this throggh the use of atomic warheads, since a greater destructive area will result due to a more extensive

detonation. Geodetic preparation for these rockets is still the obstacle. They are preparing cadres, improving aiming devices that I gave you, calimators, various compasses (BUSSOLY) etc. They are trying to perfect this geodetic work. This historic event did take place -- "One does not do this like you make pancakes" and he left.

71. S: He is a very spiteful person. He probably will not be awarded (the Order of Lenin). He wants to get it very badly, not because he has 5 others already. He also has the Hero of the Soviet Union; he has many orders. But (He wants it for) the prestige. When I was at KARIAFILI's 60th birthday celebration -- a top artillery man but he has poor relations with everyone. Everyone criticizes him; they did not give him an Order. Instead he was presented with a watch engraved with his name, but this is not the same. What does he need the watch for? He has ten already. But to get an Order -- that is what would have been significant.

72. G: Now tell me how are the rockets transported? Is air transport used or is it all over roads? S: It is as follows. I told you how many axles per rocket load. That's worked out using these trailors (TELEZHKI), also the number of rockets per railroad car. Railroad loading has been worked out. There are separate subassemblies in crates which come to the assembly center. Then they are mounted. They have transported free rockets by air during training -- I know this -- rockets like the KORSHUN, in unassembled form. There is no established system (by air transport), but I do not think this is a problem. If necessary they can be transported by air. If it is possible to transport tanks by air it should be possible to transport rockets. Light tanks are transported easily.

73. G: You know this place, Mytishchi? Is the Central Artillery Design Bureau located there? S: No. I definitely know where the Central Artillery Design (RASCHETA) is located because I had arranged for a person to be employed there. It was in the hand of VARENTSOV; now it is in the hands of Moskalenko. It is on Khoroshovskoye Shosse opposite the Aganderzhevskogo Cemetery. I placed the son of your friend BERDENNIKOV, who was my direction chief (NACHALNIK NAPRAVLENIYA) there. I arranged things for so many people. Maybe that is why I am still in the position I am. It helps; everyone puts in a supporting brick. This BERDENNIKOV came to me...

74. G: Is VORONOV in charge of this? S: What VORONOV? G: Yours. S: Chief Marshal VORONOV; he is a consultant to the Minister. G: Concerning this? S: No, a general consultant. Chief Marshal

of Artillery VORONOV. But VORONOV was not made the commander of the strategic or ground rocket troops. He is a consultant to the Minister. G: VORONOV. S: VORONOV, Chief Marshal of Artillery. He was commander of artillery at Stalingrad. G: So he is consultant to... S: ---To MALINOVSKIY and/the Consultative Group. Your friend SHALIN is in this group also. All important retired Generals are in the Consultative Group. But SHALIN is aging now. He is ill, but he is a member of the group.

75. G: Was there a General FEDENKO in GRU? S: Of course, a general lieutenant. G: Is he still there? S: FEDENKO is an old intelligence man. He was one of the chiefs of Strategic Intelligence. He was deputy chief of the Directorate but he was never the chief. He was in Germany for a while. G: Is he in Moscow now? S: FEDENKO is in Moscow but not in our Directorate (Strategic). G: It's strange that he is not in yours. S: He is somewhere -- concerned with scientific matters. I will find out for you. He is not on the higher staff of the GRU.

76. S: There are two deputies, MANSUROV and ROGOV. G: Of course. Is there a General FEDOROV there? S: Yes, he works for us, Major General FEDOROV. G: With whom is he connected? In which directorate? S: I think he is doing something in the 10th Directorate. G: You mean the Directorate of countries of Peoples' Democracies? S: Yes.

77. S: General of the Army TULENEV is alive, the former Commander of the Military District of Moscow. He is also connected with the 10th Directorate. G: He is not in retirement yet? S: No. He still works. I see him at the barber shop which serves generals and us. He does not have to wait in line as we do. (All laugh)

78. I will send you the new organization of the Committee, the telephones, and I will send you a list of the General Staff. There all the names are listed alphabetically with two telephone numbers. There are two switchboards -- the three digit one (TROYCHATKA) and the four digit one. I will give you this list; it is printed. The ranks and positions are not included. Example: Reception room of MALINOVSKIY, KONEV, etc. It is very easy to get this.

79. G: Do the troops have means by which they will be able to determine when they are attacked by chemical, bacteriological... means? S: That is a good question. Here is the answer. All

intelligence has the task of finding out about the enemy's intentions to launch a chemical or bacteriological attack. The task is given to everyone starting from military intelligence, and we have the task from the operational strategic standpoint. The first priority is rockets; then chemistry and bacteriology. G: Do the troops have anyone attached to them for this purpose? S: The troops have cadres that are trained. I repeat -- at the academies, institutes and military schools they have the task of teaching the troops the types of attack, protection procedures, and how to conduct chemical intelligence. G: Yes, that is clear. S: That is part of the Chemical Corps? S: Yes, exactly.

80. G: What are these secret military addresses? Example: Leningrad-300. Moscow-400., etc. What do they mean? S: This number is not assigned to any one unit. It is a military RAYON. The address will first read 'Moscow-300' and then there is a postal box number (POCHTOVIY YASCHK) or a former Field Unit number (POLEVAYA POCHTA). Field Unit Number is a wartime term; now it is called postal box number or Military Unit number (V.Ch. - VOYSKOVAYA CHAST'). So the 300-400 is the RAYON, in which some six units may be included. They know that it should be sent to this sector, to a garrison. It is a very general, or prearranged mimerical indicator. There they have the P.P., V.Ch. and for secret civilian installations which are military material producers it is called Post Box (P. Ya. -- POCHTOVIY YASHCHIK). No military unit even has a P. Ya. A Post Box is an indicator of a defense enterprise, a secret scientific institute, a civilian aviation plant, etc. P. Ya.! V.Ch. is a military unit. POLEVAYA POCHTA was a term used on the front during the war. It is no longer used.

81. G: Do you know what the exact numbers are which are assigned to specific defense installations? S: To electronics, optics, physics, etc? G: Exactly. S: I have, available to me, very many post boxes. Specialists from secret enterprises come to us at the GNTK, and when we write up their personnel files we write post box so and so. We don't write the name of the enterprise. G: In the Committee? S: In the Committee. I will give it to you. G: We will thank you for that. S: These specialists who come to you, the TV and film specialists... There are many secret enterprises connected with electronics, exact mechanical things. I have the name from post box so and so, address so and so. I will send you some with names and addresses -- of the ones coming to you.

82. G: Are the Field Post Numbers in special blocks of numbers? Are they all five digit numbers with '25' being a certain

thing, etc.? S: All military unit numbers are five digit. They are not in blocks. For example, the Military Diplomatic Academy is #75033. That's the way they write it -- V.Ch. 75033. Everything goes to your relative, Mr. Georgiy, to KHLOPOV. They are not grouped in any way. Military units are grouped in a garrison and every unit has its block. S: For example, if the rocket troops' military unit is '38' and 75033 is KHLOPOV's. G: Interesting!

83. S: KHLOPOV -- if we take him as an example -- is within the city limits, but on the outskirts. There are not other battalions or divisions nearby that would be under KHLOPOV's command. They are all subordinate to the commandant of Moscow, who just got promoted to a lieutenant general -- a big, tall fool with a large forehead. He was a division commander at Rostov-on-the-Don. His first deputy is VERESHCHENKO who was the deputy chief of my course (class) at the Military Diplomatic Academy. General KHLEBOV was the Chief of the course. Colonel VERESHCHENKO was the deputy and had me running around for four years. Later something happened. He was kicked out of Strategic Intelligence completely and he was able to get the position of Deputy Commandant of the city of Moscow. He still has this position. I see him often. His wife died from cancer recently. He has two children.

84. G: Are there numbers like, let's say, 25000 to mean artillery, 17000 will be the engineers, etc? S: Yes. G: What is the relationship? S: I don't know. These group numbers are always given in this way. The numbers mean something. That's the way it was developed. Here is what I can do. I will take several units of the artillery -- the (VOYENNAYA CHAST) the field post number and we can find the key. There is always a key in the number. Here please -- in intelligence we always have a zero 75033, 22504. There is an institute (FILI) of your friend, VARTANYAN. There are many; I don't remember. The zero indicates that it is an institution belonging to the Second Chief Directorate, GRU. G: Ah -- so there is a specific system. S: Government cars always have a zero in their number. A zero in a four-digit number is always a government car. There are not too many government cars. They are changing to Chaika cars now. All KGB, Ministers, various chiefs -- their cars all have a zero. SEROV has a two zeros! But they are four-digit numbers.

85. G: Have you ever seen or heard radio sets named BERYUZA or KREMNYY? Do you know anything about them? S: No, There is a KREMNYY, but I have not heard about the first one you mentioned.

#12

G: The first one is BERYUZA. S: I have not heard. It is BERYUZA -- a stone. KREMNIY is a type of quartz. G: So both are stones. How about R-401? Do you know about it? It is also a set of some kind. S: I have not heard. Is it used in aviation? G: It is used in general for radio transmission. S: I have not heard.

86. G: In general, what sets are used for coded messages or as radio equipment? Are there any special names which are used as cover names? If one wanted to transmit something and rather than use a certain number, use a name like "on the string";"on the LUNA"... S: You see these prearranged indicators are always used, but there is no system for their use. They are always used as cover names -- MARS, LUNA, KORSHUN, etc. They are always used. Nothing can be called by its real name. Where there is an "8", it means rockets. A brush for the rocket will have an "8" if it is a separate piece. (laughs) S: The air heater, which is a metal box with a centrifuge, an electric ventilator -- the number starts with an "8". I named many of the numbers starting with an "8". You can't say launching platform! You can't say the air warmer for the rocket. They will take your Party card at once. (S laughs.)

87. G: Remember, when we spoke about the atomic weapons you mentioned that there are BOYEVYYE RADIOAKTIVNYYE VESHCHESTVA (combat radioactive substances). Are they used in shells or in some other missile? Are such missiles operational? S: We did not go into this because we were not taught this. However, they exist for use in battle. They are products of the decomposition of atomic substances. G: Yes, exactly. S: It is the effect after the explosion of a bomb. This is all considered. We consider that the destruction of an atomic bomb consists of heat waves, shock waves, flash waves, radiation, and then all the radiation by-products -- radioactive dust that is carried 25-50 km depending on the wind. If it is carried in the direction of our troops, they will be given the command to put on the protective clothing, etc. G: That isn't the question. That is normal.

88. G: Are there substances of this type that are delivered in a warhead. S: They exist! G: Then they act to contaminate a whole area. Is it considered to be a separate method? S: Yes. It is taken into consideration -- created and planned. It is not considered to be very effective, but it is a supplemental method to poison an area, water, etc. G: Is it considered to be very important? S: I did not mention this in my notes but I know about it. This is put into special warheads -- I mentioned two types of warheads yesterday but...forget one. There are stockpiles of missiles (shell or other) filled with the substance. It can also be spread from a special apparatus carried by planes, not only by warheads fired from the ground to contaminate an area. Yes, definitely there are BRV's. (Short break while tapes are changed.)

89. G: Regarding the signal by phone, do this on Monday rather than Sunday. S: Where will I go on Sunday? Oh! So that's what you have in mind; I thought you were doing this in general. G: No, it is better a day later.

S: No, no! I will arrive in Moscow on Saturday at 1905 hours. I will spend 30-40 minutes for formalities, passport, saying farewell to the delegation, etc. I have a document there stating that I am a member of the delegation. G: Wouldn't it be better if you did it after you visited your office and made sure that everything was in order? S: No, I will go home. Then, an hour later, I will leave and will call. G: If this is convenient for you. S: This is convenient forme, but I don't want to go against your decisions. G: But wouldn't it be better if you spent a couple of days in Moscow, went to the office and determined that all was in order? S: So that is the wayyou want it! G: What do you think? You know, from the official standpoint, it is also more reassuring to know that all is well. S: Maybe I should call Monday. G: That's what I thought. S: Saturday and Monday -- aren't you interested to know that I arrived home on Saturday and that many things have been properly concealed? (Laughs) G: Of course. But remember that we also want to know how everything is at your office and that no one there hasany suspicions. S: Okay. Let me call on Monday after work. G: That is not necessary because if the signal is received on Monday that all is well it is clear that everything was in order on Saturday. S: So I will not say anything on the phone. I will just ring. G: Twice. Two series. S: Yes, two series. That's all. If there are many series then something is wrong and you should look for an explanation. G: Just so we don't have a mix-up. If everything is okay on Monday, it means that everything was okay on Saturday. S: Yes, that's right. G: This way you will have the opportunity to visit the office. S: What date is this? Saturday is the 6th, so it will be the 8th. G: So on the 8th. S: Okay. G: At what time will it be convenient? In the evening? S: To call? G: At 2000-2100 hours? S: I can call at any time. G: But you have to leave home.

(90.) S: Yes, I can stay late at work. Coming (home) from work, to the right from the office, is a church where I go to pray. Opposite the church is a public bath (BANYA) where I stop to drink beer. G: In the public bath? S: In the public bath. There is a counter there. The public bath is opposite the church, and there is a public phone right next to the entrance. Further to the right is the kiosk with beer and there are the Mens' and Women's rooms. (All laugh) S: To the right is a dead-end street (TUPIK). There is never anyone there. There I have a spot from which I can check surveillance (KONTROL'NAYA TOCHKA). I like this street that leads from the public bath and church. It is better to orient onself from the church. Ul. Stankevicha leads directly to the Chaikovskiy Monument, the conservatory on Ul. Gertsaga. There are some very nice houses there -- musicians/artists lived there and have since been buried. There are plaques on these buildings, about four of them. There is a garden (POLUSADNIK) in front and the entrance is very dark.

It is very easy to go that way, stop in the entrance, kiss this girl, and give her the material. (All laugh) S: Maybe she won't be able to recognize me in the ark. (Alllaugh) S: I would do this so she would not worry. (All laugh) G: So she would not call for help!

91. S: We should think this other thing over. It was a very good idea to throw (the material) over the fence into the American House grounds. G: That is, at a specific time. S: Definitely. There is a pool, a garden. The dog can be taken out for walks there. It is easy. I once had the idea of jumping over the fence. G: It is high. S: It's high, but it's possible to climb over. G: About four meters. S: There is one place where it can be climbed. There is a little house there; one can get on it and jump over. G: Why climb there? S: It is territory where diplomatic immunity can be claimed. G: That is a dangerous idea. Why? S: I wanted to. I swear I wanted to climb there with my material. I had the material in my pocket. G: Yes. S: KHRUSHCHEV was going to the UN. He should have been exposed and the rocket information that was needed should not have been delayed in lying around for so long. Some sections of the material are two years old, from the beginning of the course. This was not written in one day, but during the whole course. We'll have to study hard. It's May 1st today. (All laugh) S: We need vodka. To the fame of Russia!

92. G: What do you know about the latest tanks? For example, is there something new after T-10, the heavy tank? S: It's good that you asked this question. A lot of attention is paid to tanks. They are built in large numbers. VARENTSOV is cussing; he doesn't believe in them completely because although theyhave their advantages they are clumsy. It is easy to knock them out. And this whole armada of tanks can become scrap. He is very unhappy that KHRUSHCHEV and the Government administrators have been convinced by the Minister, the Commander of the Armored Troops and the Highest Military Soviet -- not the Scientific one but the Military composed of all the commanders of the various types of troops. Tanks are built in large numbers; some tanks act as carriers of launching platforms. G: That is clear. S: No. Not only the launching platforms I mentioned, but free rockets as well. A lot of KATYUSHA rockets are mounted on tanks. A lot of work is being done on the tanks regarding their speed, the reduction in weight and the strengthening of the armor. This is the cause of a fight which is going on through our Committee -- getting information on the strength of new steels, etc.

#12

93. S: The main deficiency of Soviet tanks is considered to be the excessive weight of the armor. The maneuverability and speed could be improved by just reducing the weight. A lot of money is spent for tanks. There are no absolutely radical new tanks. There is a constant improvement of the Js and tanks you mentioned from the standpoint of reducing the weight of the armor and increasing the strength. Also improving the engine and fuel quality. Formerly heavy fuels were used -- heavy, unrefined. Now I hear they are developing new fuels. They are working on this but I can't give you anydetails. G: So there is nothing new? S: There is nothing new; we studied them. G: So the last one is the 54. S: And also the Js are also being improved. G: And the floating ones, the 76? S: Yes. You know that they showed an amphibious tank in the parade today. G: There was? A 76? S: Yes, an amphibious one. They were shown in the last parade also. I was at the Embassy today. G: Yes, and that is all there is? S: There are no absolute new light, medium, or heavy tanks. There are no new models or new types of construction. They are improving the existing ones and produce large quantities of them. So they are operational and are highly mobile. They form a big advantage from the standpoint of firepower and movement for the striking forces.

94. G: Are there large tracked vehicles for personnel, for [illegible] crossing water, etc.? S: They have everything. I will tell you. G: Have you heard of the self-propelled unit, the SU-71? K-41 is the normal, small one. S: Maybe. I don't know this number; it does not mean anything to me. Self-propelled units using the tank chassis exist. There are special command tanks, mobile observation points. They have light protective weapons, short range weapons for close range combat, no cannon or anything. It is equipped as an Observation Point; it has many sights (Episcopes), lots of equipment, and is useable in all directions, 360°.

95. G: Do they have TV as well? S: Infra-red techniques are widely used in tanks. G: So they can operate at night? S: They can see at night. G: Do they have gyroscopic equipment like a naval ship? S: I understand. For the stabilization of the armament in any mobile situation. It exists! G: This exists. S: Dzerzhinskiy Academy had a very large faculty working on this matter. The position of the gun is stabilized, no matter what position the tank is in. This is very well developed. The problem has been solved. G: Is it in all the tanks? S: The infrared equipment? G: Infra-red. S: No. It is special, especially in these tanks, the command points. These tanks are used as scouts. At night, they are sent far out and use the infra-red rays. G: And all the tanks have it? S: These tanks that are to be used as command points, special tanks. G: A-a-a-h! S: But they don't have much fire power.

In return, they are covered by the fire power of the other tanks. The commanders sit in these tanks. G: Do the combat tanks have infra-red that would enable them to operate at night also? S: You see the infra-red equipment is portable. If it is needed, it will be installed in a tank. But these special tanks already have it. G: But in general they don't have it. You answered that clearly. S: I think they don't have it and there is no reason to have it.

96. G: Have you heard anything about the new mobile installation 122 (30)? S: Yes. There's a new one, but I am not familiar with the number 122. G: This is a gun. S: A gun? I thought 122 was a number of a component. There is a 122 mm; it exists. G: A new one? S: One hundred twenty-two mm with rifling. G: Yes, a new improved type. S: I will tell you what is improved. I know because I visited that tank park (TANKODROM). It is outside Moscow at Kubinka. I'm trying to remember where that chemical thing is and I can't remember. G: What direction? S: It is 70 km away. G: Could it be near Solnechnogorsk? S: No. I know Solnechnogorsk. G: Could it be Seneshno? S: There is a Lake Senesh. G: Yes, that's right. There is an island there also. S: Yes, there is an island there. S: The former range (POLIGON) is there and the highest combined arms courses are given there. G: Exactly, combined arms with tanks, artillery, etc. S: They have everything. G: I don't know your tankodrom location. You tell me; I don't know any other place. S: I can't remember the chemical center. I will find out. I will remember. G: Do you want the map? It will help. S: Here is Kubinka. Ask me questions while I look. Now about the tanks, new ones -- and the gun.

97. S: Now to finish about the 122 mm gun. A new turret (BASHNYA) has an improved design. The turret is high in front and slopes down in back. The opening where the barrel comes out... it is good I remembered. The recoil mechanism has been redesigned. It is now a double mechanism -- one above and one below. They were able to reduce the length of the recoil mechanism because of this. The recoil is now taken up by the double mechanism. Improvements of this type are constantly going on. (Pause - S looking at map.)

98. S: The Military-Chemical Academy is on Vlitsa Radio, Dom 10. This is the name of VOROSHILOV in Moscow; it remains as it was. It is very large and it has a lot of equipment. They have tanks there with flame throwers. I saw them in operation there. G: Who is in charge of flame throwers, the engineers? S: No. The head of the chemical troops is in charge. The engineers, of course, provide the equipment; there are special plants for this. They work together very closely. Engineers are from Kuybyshev Academy in Moscow. It is located

close to the Dzerzhinskiy Academy. I will remember this; I have this written down. I have all this information on our equipment. Of course there are many new Secret ones there. It is in my workbook, where I have military notes written down.

99. G: Where is your workbook? In GRU? S: In my desk. G: They were in GRU? S: No. This is my workbook on military matters, strategic directions, etc. There are many Secret things there for me. If it should be found it would be bad for me. G: Of course. S: It is in my desk. It is locked and I have the key here with me, in London. G: Don't lose it. S: Just one key. I didn't even leave it at home. G: You would have to break open your desk. S: The lock is a special one that I had installed like the ones used in a piano. I took the other one out. The key is here; I can show it.

100. S (Looking at the map): You know it is somewhere to the northeast, 30 km, but here details are not shown. G: Not Pushkino? S: No. G: It is to the northeast also. S: No. Correct, here is Pushkino. It is a short word. One can go there like this ... G: By electric train? S: You can go by electric train, but it does not go that far. I went there by car. We have the Main Veterinary Institute, and there they have a Military-Veterinary Faculty, even now though we hardly have any horses left in the army. They only use them for transport in internal IKHOVS. If you go past this Veterinary Institute, to the left, is the Strategic Intelligence Institute where your Armenian friend VARTANYAN was the chief (PILI). And this road goes straight past a large mansion, and then goes into the woods; the range begins there. I will write this up. Let's not waste time. I can't remember now.

101. G: What schools or academies have been closed these past two years? S: First, the Rear Services Academy was closed at its base in Kalinin. G: So it was transferred? S: No. The faculties were scattered. One faculty was given to the Leningrad Academy, others to the Frunze Academy. A new academy was created (PVO in Kalinin) and has been in operation for two years and is beginning to produce cadres. To start off, higher academic courses for the PVO were established. Two classes graduated from the higher academic courses. Now the PVO Academy is subordinate to BIRYUZOV. The General Staff Academy in the name of VOROSHILOV was closed. They organized a faculty and placed it in the Frunze Academy. They consider that at combined arms center, the Frunze Academy, it is possible to teach an even higher level -- Generals and Division Commanders. This formerly was done at the VOROSHILOV Academy. This VOROSHILOV Academy does not exist any more.

102. S: In those buildings, your friend YERZIN sits now and this is the Institute of People's Friendship. (Laughs) That's what they created! G: Yes. S: It should be exposed so that persons would not be sent there for study, and the Institute would close. It's not an Institute; it's a University. If you decide to play it up well, refer to the following fact. When I was in Odessa, before I met the American interpreters, I heard with my own ears over the radio, in early August 1960, "Now we will have a word from Prorectors -- YERZIN and someone else." So in Odessa, I heard YERZIN's voice in my hotel room in the evening. He said we have accepted so many students of all nationalities, as well as Soviet youths; we plan to accept so many more. This was in 1960, when the University was beginning to function. This does not come from me as the source. The whole world heard YERZIN about (you can say), "We know who Comrade YERZIN is! Comrade KHRUSHCHEV, how are we to understand this? Why are you cheating these negroes whom you are supporting, etc., when you are training them as your spies there!" This can be played up very nicely; this should be used to embarrass him. These negroes sell themselves without any hesitation.

103. S: So YERZIN spoke over the radio. He has the same cover story as I; he is supposedly discharged. At one time he did serve (in the army), before he always claimed to be an MID worker. His file has an entry that he served in the army. He never served in the Army; he served in the KGB and he is in the KGB now! Before he was appointed Prorector, and after his removal from Turkey.

104. S: I left on 5 November. On 4 November, I called the Turks. Please check this. Do they have a record of this or not? If not, they are fools. (Laughs) I am sure they have it. Such things are not missed; I called directly to the First Directorate. G: We can't be too nosy in this respect; the Turks don't know about you. S: But maybe somehow unofficially. G: But why draw their attention to this? S: You are right there. But maybe in some way, maybe by chance. G: If by chance then. S: I made 4-5 such calls over the telephone. YERZIN left in a year. He had unpleasantness with BEDOV despite the fact that he personally recruited a Scandinavian diplomat and gave him 5,000 Turkish lire all at once. They took money from me, from the operational fund. Later they reimbursed it.

105. S: VAVILOV, YERZIN's Deputy, was a good friend of mine and FEDOROV and YOSHKOV were his operational workers. Also the one whose picture I identified yesterday but could not remember the name. We noted it down, that he was in Turkey, and also his number. G: This is not important. S: And so VAVILOV came to me and said he needed money urgently for a person they had bought.

I said, "Please sign the receipt". I placed it into our folio; one section is with the codes and the other is the operational portfolio. It is sealed and with a zipper on three sides. I lent them the money. So they didn't take any money from the Embassy; they took the money from me. The agent was someone from Scandinavia, no name or anything. When YERZIN returned, he had troubles with SEROV. I met YERZIN. He was always very nice to me.

106. S: He gave me all his keys and his communications channel, when I reported to SEROV about the deceit of the General and all the General's affairs. I was right in doing this; it raised my stature a lot. I acted from the standpoint of the Party, and honesty. It was absolutely right and proper, even though I entered into a conflict with the General. When I spoke to him he said, "Get out of here you babe in arms". He often sat in my office on the first floor with me and drank Vodka.

107. S: YERZIN had troubles with SEROV because of failures in Turkey, and SEROV was making trouble for him. He bought a car in Syria and exchanged the new foreign car in Odessa for a Volga. This was done so as not to attract too much attention by having a foreign car. Foreign and American cars attract a whole crowd (in USSR). The Militia chase the people away claiming that they bow down to Western accomplishments. (Laughs) Whenever there is a car at the Metropole (Hotel), Intourist, or an Ambassador, etc., there is always a crowd. This is beside the point. I met him (YERZIN) and he offered to give me a ride in the new car and said, "I'm in a bad mood. How are your affairs?" I said mine were not good either. He said, "I have this jerk (SEROV to deal with); he does not want to listen. You make a report to him and he is probably thinking about KHRUSHCHEV's daughter". He (SEROV) is married to a relative, not a daughter, but a niece or something. In any case, SEROV is related to KHRUSHCHEV in some way, the same as the Chief Editor of IZVESTIYA, ADZHUBEY. G: That's clear.

108. S: ADZHUBEY visited you and he is a complete fool. The world of journalists hates him because he compiled and edited a book of all of KHRUSHCHEV's speeches in the USA -- speeches that were written by the Central Committee. For this he received the LENIN prize and medal. It is called a TRUD (work). (Laugh) As soon as KHRUSHCHEV is criticized then the book can be thrown out. (All laugh) S: It was printed in large numbers. It is so thick! It contained all his speeches at banquets, etc., that he read from notes. All this ADZHUBEY compiled. You see, it pays to be a relative, I would like to be a relative.

109. S: What was I talking about? G: About the old and new academies. S: Yes. So YERZIN said he was fighting with SEROV. He said when you report to him he doesn't even listen. YERZIN worked for ZHUKOV in the Committee for Cultural Relations Abroad. From there, he was appointed Prorector, with the objective that he would develop a spy school. G: Is ZHUKOV the old Intelligence man who was not sent out anyplace because of drunkenness? S: No. This is a clean MID type. So suddenly he was elevated to the position of Prorector. This is a high (position). He lives on Frunzenskaya Nab, not far from VAKHTSOV, about three houses beyond Stroitel'naya Ul. I was at his home, on the 5th floor. He has two rooms. He is married and has two sons. So he was elevated to this high position as Prorector.

110. S: YERZIN has an operational staff there. Among them is a Colonel of the Armored Tank Forces, who was Chief Assistant in Afghanistan twice. He was kicked out from the Strategic Intelligence organization. Mark his photograph. He is now a civilian employee of the Institute with YERZIN, but he has active tasks. Other KGB personnel were obtained by YERZIN and now serve as instructors; some were accepted, and some are also in the administration of the university. So our Colonel got a position there. I asked about YERZIN and the Colonel said, "He thinks highly of you. He remembers "(Subject's true name) is a good operational worker; he has high principles". [redacted] is his name. Write down Colonel of the Armored Forces, Leonid. He was in Afghanistan twice and after his last assignment, from which he returned in 1960, he was discharged. Before that, he was the Assistant in Turkey. He was abroad 3 times. I have not seen his photo yet. YERZIN is using him also.

111. S: There they are taught MARXISM-LENINISM. They are prepared morally, and then when they return (home) they can be political, or any other kind of agent. They prepared Patrice LUMUMBA there. This has to be exposed and destroyed. It's absurd! It is false all around! Did you write this down? YERZIN was in Turkey and twice in Afghanistan. He was discharged because of age; he did not work well in the organization. He worked for TSAREV; he was his assistant.

112. S: Write -- TSAREV, Military Attache in Afghanistan, replaced now by Hero of the Soviet Union, Colonel Vasiliy POKICHKO. He graduated from the Academy together with me. I probably have named all 98 persons by now. Don't forget that I'm the 98th! I have named 97 already. Is there a photo? Please pick out a good one. (I showed Subject his own picture taken on a Polaroid.) S: So you have POKICHKI? G: Yes. S: He finished with me in 1953. He is a Hero of the Soviet Union, Combined Armed Forces. TSAREV, whom he replaced -- you see we have a whole chain -- is now the head of the course in the Military Diplomatic Academy. He is working there already. He is Head of the 2nd Course.

#12

113. G: Do you see military maps? S: Yes. I have them in my possession and I sign for them. I enter the situation or they give me situation maps that are all printed showing the Front military operations. We enter our own notes. G: Can you get one of these? S: I can only photograph it. Every sheet is accounted for. We have good scales: 1/200,000, 1/100,000. G: 1/100,000 would be especially nice if you could photograph one. S: 1/200,000 and 1/100,000 are very good. They show Moscow and everything. G: And all the regions of Moscow that are needed. S: The maps are new and all that. G: We are interested in them not because they are maps of the Soviet Union, but because of accuracy .. the scale and particularly new geodetic calculations. S: They have very strict accounting of all sheets. They are counted 10 times, when they are issued and returned. A person lost a sheet once. It was really not lost but destroyed, like the notebook I told you about -- the one that was destroyed by an internal enemy. There was a Tribunal; there was an order from the Army. It is very difficult with these maps. How about photographing with the Minox? Will it come out well? G: No, that won't do too well because there are scales there and ... S: So it has to be on the 15½ x 21 cms. G: You can't help that because the Minox has a very small frame after all; it has to be enlarged.

114. S: Now, I want to ask you this. It is very important. I have 15 agents. The details are all written in longhand. The paper is rolled up like a tube. (All laughing) S: When I return, I will type it up in detail. I have a lot of information about them in my head. G: Of course. S: Then should I give this paper as it is or should I photograph it with the Minox? Should I fold it up like this? I think it's not necessary to photograph it. Yes? G: If you can give it to WYNNE.. S: It will be in WYNNE's package with all the documents. There will be a separate package with Top Secret documents, and the other with materials that are for Secret Use Only. G: He will go directly to the Embassy. S: That will be fine. So I won't photograph it. G: No, don't. S: It comes to the same thing. He should only use the camera when he can't write. G: The Minox should only be used when you can't write. S: Yes, I see. G: For anything else, longhand or typed -- whichever is easier -- is fine.

115. S: Okay. Now, this task that I have to finish worries me and interests me. This information is in the field of things that I am supposed to know about. Now, when I give all this data to you, it will be so easy that you can find them tomorrow. You won't touch them? G: No, we won't touch them. Absolutely! S: How about the one in Ceylon? G: We will wait until you are in complete safety and you tell us to act. S: If anything happens it will immediately be

reported . He is in direct contact with GRECHKO. You know Colonel GRECHKO? G: Yes. Let's put it this way - we won't do anything without your agreement. S: But my agreement is to make him useless. That is my debt. G: Yes, of course. S: But it will be reported - TOP SECRET and TOP PRIORITY -- and a commission will be created to investigate who had access to the agent. My signature is there, every place! G: We won't do anything until you tell us. S: If you can do it in some way to neutralize him; he has 3 children. G: No, we will wait. It doesn't pay. Let him stay. S: But he provides special information. G: So let him. You are valuable also. Why should we endanger your life. H: That is not necessary. S: And how about killing him; run him over with a car? G: We can overdo it with this matter. Why kill him? S: Why not! For the cause! G: There are humanitarian considerations. S: Humanitarian feelings should be put aside. KHRUSHCHEV does not take this into consideration. G: Of course not, I know. S: (Laughs) So my request is that if you do it, then do it in such a manner that it appears to be an accident. G: We won't do anything. We won't do anything like that because it is dangerous. S: Anyway, keep this in mind.

116. S: I met ALEKSANDROV recently, who returned from Ceylon. This Novatinex that I ordered yesterday for kidney stones -- ALEKSANDROV asked me to get it for PLAKHIN. PLAKHIN studied with me; he finished the Academy with me and was the Military Attache in Syria. Now, he is Head of a Direction in the 4th Directorate. I gave the order for the bottle of Novatinix through ALEKSANDROV. I asked him, "Well, how is everything"? He said, "Fine, this one (Ceylon agent) is giving us information all the time and it is being evaluated very highly". G: Let him stay there.

117. G: When your attaches go abroad, who teaches them the new things (tradecraft) that they have to know for work? For example, a person is abroad for two years - who keeps him informed on the new developments about which he needs to know? S: Through Letters of Instruction (DIREKTIVNYYE PIS'MA); they all get instructions. The Letters of Instruction are written on separate items, with directions that after reading, the letter should be destroyed and this (destruction) reported by a document. This is done. It is sent on undeveloped film. G: Yes.

118. G: How about the underground testing of nuclear weapons? The (Soviets) are shouting that a suspension has been in effect since November 1958. What do they want, a permanent suspension, or are they acting with deceit? S: Of course they are acting to deceive, in order to gain time, so that you will not carry on experiments and develop new, more advanced, technical theories and check them out. It's to their advantage. It's all deceit. Of course!

They cover up with strategic rockets, sputniks. G: So they themselves act but want to stop others. S: Yes, and in this way slow down the development of others - your personnel, experiments, conclusions, and developments of these weapons. (Pause) S: For some reason, I was thinking of this. You will get some reports about his (KHRUSHCHEV's) deceit. Check them. You will believe what I reported. In the meanwhile, he shouts, drinks and makes a lot of noise. If you could say, "How about this YERZIN? Who is YERZIN? Who is this? And this one? How did you discharge this one? How are you cutting down the amounts of funds for this, this and this?" You know everything! His mouth will drop open! "Where do the funds go for the baby nurseries? If you gave all this to the children, they would be covered with gold!"

119. S: You know how these billions are collected? The Army is huge and they cut allowances of the cadres by one-half and more. Formerly I received 300 rubles for discounts; all Colonels received this. They don't pay for languages now. Regarding the Secrecy allowance - now they don't pay a cent for Secrecy, even if you work with codes. Before pensions were normally 90% (of salary), and in some cases 100% for special services rendered. Now the ceiling is 2000 for a Colonel and 3000 for a General -- 200-300 new rubles. They save a lot of money. A person who had a very dirty role in this, and is hated by the military, is FURTSEVA. She is the one who proposed this and ZVEREV supported her in this. Then ZVEREV became sick and he was ousted. He (ZVEREV) was the Minister of Finance. The officers were ready to kill ZVEREV and FURTSEVA or impale them on a stake.

120. G: Have you heard of any new thoughts regarding new atomic or rocket tactics? For example, is there a new doctrine? S: Tactically, the conventional rockets are for standard calculations. In using atomic ones, the effect of the explosion is computed with respect to the densities (PLOTNOSTYY) of attack, the parameters of the combat area, the withdrawal of friendly troops, the protection of equipment, neutralization of an area. These are all combat considerations. G: Yes. S: This is all in the regulations. We will photograph it now. Fifty frames on a film. That's good! That will be 50 pages.

121. G: Are there any special new developments regarding tactics? S: Yes, there are. G: There are, also. This is very important -- if you can find it -- the new battle tactics, the changes due to employment of atomic weapons. S: I will get all this for you. In four days we will part. I am only telling you that you will be getting all these ideas, their developments and conclusions, photographed on film. It's impossible in any other form.

HZO: Of course, we understand. S: I promise that this will be one of the first tasks. This is readily available to me. All I have to do is go in; take it; photograph it; return it, saying, "Thank you. I had to look at a couple of pages there." I can spend a half-hour on this and in a half-hour, I can photograph the whole book. The film won't be developed. G: Fine.

122. G: You mentioned this before -- what were the main points in the Secret letter from the Central Committee concerning relations with China? S: The main points -- 7 main points of conflicting views with theChinese, of a general, theoretical nature. Seven separate points. The letter was this big and thick. The first was disagreement concerning the possibility of co-existence. The Chinese, of course, advanced this idea and these 7 points are interconnected dialectically. They are not separate; you can't say that one point can be changed but not another. If they would operate as they wished and would not connect their stand to theother questions they would be simply enemies. And the Chinese are clearly not fools! But this way the Chinese also have some very sound ideas, like TITO, who has his own good ideas. Concerning the question of peaceful co-existence, the Chinese claim that it is temporary. Peaceful co-existence can't last long. Regarding this, they say that KHRUSHCHEV and the Central Committee of the CP/USSR are not interpreting the matter of war. Our Communistleadership claims that war is not inevitable. The Chinese say that this does not mobilize the working masses, the Communists and peoples, not only in our countries but also in the countries that are to join us some day. On the contrary, this leaves them cold. That is the basic idea. If you want I can get this letter, in the form of photographs. Maybe not the whole thing, but separate points, because it is very long. It was read inabout 2 hours. There are so many theories there -- 1,000 people were there.

123. H: I do not think he should spend much time on that. G: I think this is dated already. It is much more important to get the military materials, the manuals, lectures, etc. S: Alright, you give me the priorities. You can't grab everything with one hand. G: Of course not. S: So the Chinese said that when KHRUSHCHEV wants to prove that war can be completely avoided, he is completely wrong. This cannot be done because the Capitalist system exists with its own interests, powerful army, means of attack, etc. Therefore, what KHRUSHCHEV says he does not believe himself. If this would only bear on the interests of KHRUSHCHEV and his small group, it would be one thing. But such a theoretical statement with a foundation only cools the masses and the peoples who should be influenced oppositely. They should be mobilized for a war with Capitalism. That is the point that they made. As you see, these ideas cover some of the seven categories when they are separated, but they are all presented together. This is in general terms. I can photograph these separate

points; they are printed in large type. G: Or you can write, copy them. S: It will take too long to write. G: No, just the main themes. S: I can take the letter from the Party Committee (PARTKOM), sign for it.. G: But don't give too much detail on this. He spoke for hours there. There is a great mass (of material). It's a whole volume. S: It's a whole volume.

124. S: Next the Chinese spoke up against the condemnation of the personality cult of STALIN. This is in the letter. First, they discussed it in general terms, and then in detail. They said that when speaking about deceased persons you should say nice things or keep quiet. That's the Chinese attitude. The Chinese admit that STALIN had faults, but they say that every political leader has them and despite all of his faults STALIN was working toward victory in the end. He mobilized the masses; he put them under his command through the use of force, through the KGB, with a piece of bread, through fear. He was a tyrant. KHRUSHCHEV criticized (STALIN) for his use of a globe to point our directions. He had a huge globe in his office in the Kremlin. He spun it around and pointed out directions to his commanders. He pointed out directions but STALIN also worked with maps that were prepared for him by the 1st Operational Directorate of the General Staff. KHRUSHCHEV brought this up. KHRUSHCHEV said, "He managed operations on a globe." You know, this was just childish! G: Of course.

125. S: The Chinese listened and studied all this, then they quarreled with KHRUSHCHEV. Listen, MAO TSE TUNG has not gone to the Soviet Union for several years now. KHRUSHCHEV went (to China) only once. The Chinese sent to the USSR were all at the level of 2nd or 3rd ranking men in the Government even though KHRUSHCHEV is considered to be the 1st man, not only in the USSR but also the other People's Democracies. He is considered to be the top man, the Commander-in-Chief. Now GRECHKO has been appointed, but still this is under KHRUSHCHEV's control.

126. S: Now about the personality cult and the harmful effects which they again equated to the idea that the rank and file Communists, who are not deeply indoctrinated with the (Communist) theory, lost their faith in the Communist Party when they heard this matter about STALIN. Another person who can think this out deeply and can separate one item from another without mixing them up will remain a Marxist, a Party member in his views. But the rank-and-file -- for example a negro who carried a photograph of STALIN as a symbol(of Communism) -- when they found out about this, they tore everything up and he in this way destroyed their faith in the Communist Party. This is the Chinese analysis. It is all said very correctly from a Party viewpoint. Listen, at one time KHRUSHCHEV wanted to take the casket (STALIN's)

#12
and bury it in or next to the Kremlin Wall. He was talked out of it. I told you this before, that when the Chinese spoke at the last session (KHRUSHCHEV) said, "Take him (STALIN), together with the box". These are historical -- historical in quotes -- words. Sergey Sergeyevich told me this -- KHRUSHCHEV said, "Take him, together with the box."

127. S: Further, the Chinese are very aggressive in their policies concerning this matter of a future war. In other words, their whole political theory boils down to the fact that masses have to be mobilized. Hatred of the enemy should be developed to prepare them for war. KHRUSHCHEV's peace-loving policy, in quotes, is calculated to cloud over the minds of the peoples of America, England and other countries. Of course, the governments don't believe KHRUSHCHEV and he knows this. This is the battle forthe World. The Chinese see two sides to this. One side is good, to win time to build up arms. But the other side is that the peoples are cooling off and the revolutionary type of hatred and spirit does not exist towards the Capitalistic countries. They analyze this very deeply for themselves. KHRUSHCHEV and the Central Committee answer in the letter.

128. S: This is what we are taught and what we are told. That at the present stage, it's not necessary to analyze so deeply. In other words, KHRUSHCHEV is exposing the fact that he is fighting for peace now in order to win time so as to lull Capitalism, its governments and peoples to sleep through all methods and then dictate his own terms. Here it is in very general terms. There are a lot of interesting conclusions made there, a lot of interesting ideas. There are 7 separate questions - directions -- and they are all tied together and support one another. G: That's clear.

129. S: That's the substance of the letter. There is also a lot of water there, but these parts that cover these 7 points of the present interpretation, war and the evaluation of war, are important. The Chinese say there has to be a war. KHRUSHCHEV says there might not be a war, or there might be a war at some distant future time. They (Chinese) say war can start at any moment but if KHRUSHCHEV admits this, what will happen to his Peace-Loving Policy. It will go right under the cat's tail! G&M: Yes. S: That's why he (KHRUSHCHEV) is backing out. He says, "Why are you exposing me? I am fogging up the brains and you are beginning to remove it". That's the way it is. This is the crux of the matter.

130. G: Have you seen any instances where good intelligence material was obtained from radio intercepts or deciphering of coded messages? S: Yes, I have seen it. There are such cases. G: Yes. S: We do not possess your codes. We don't know all the keys but there are departments like LENKEY's

at Tankovoy Proezd #4, which is SEROV's (GRU). G: Yes. S: He is the one who tries to decipher everything. There are mathematicians sitting there and whenever a group, a number, repeats itself then they start hunting for the key. I think they sometimes find the key. Yes, of course, they do. We don't get anything that is complete or thorough or exact through agents, but radio intercepts give a lot. G: From which countries do you find it easiest to get this information? What results do they have? S: Radio intercepts are made in all countries -- in England, Turkey, America, etc. -- wherever there are radio messages to intercept. You can't control it in any way because a special radio recording station is located in each Embassy. G: Of course not. S: The channels are monitored. Tactical material is intercepted, that is data that is transmitted for official use. This tactical material often is concealed by use of code words, etc. It's very easy to decipher this.

131. G: When ciphers were broken, which countries were they from? Do you know? S: Those Intelligence Points located in OKRUGS which are adjacent to other countries constantly intercept messages. They have special stations, machines, special radio gear. It is called the OSNAT system. (Subject means OSNAZ - OSOBOGO NAZNACHENIYA. Comment: There are two such Regiments in the DDR under the GSFG.) G: What does it mean? S: This is a special unit -- listening equipment, intercept equipment, by radio. They also tap wire communications whenever possible. This is all the OSNAT (OSNAZ) system. And our cipher/code clerks that return from a tour abroad go to work for OSNAT (OSNAZ). There they don't lose their qualification or specialty and when necessary they can be sent abroad again. G: Do you know if the Turkish code was broken? Which ones were broken? S: The only tactical material we had about Turkey came through interception of channels of communication. We actually knew all the divisions and shipment of supplies to specific places. We know everything; numbers are repeated. This is a frightful thing. This is the first accurate tactical source which is reliable and these reports go all the way up to the government. G: That's clear.

132. S: In every country, in every REZIDENTURA, there is a representative of the Technical Intelligence. If the equipment goes out or order then under the guise of a courier, a technician will be dispatched from Moscow at once. He will arrive, bringing parts. He will repair and turn up everything. They are Colonels, Communications engineers, and they really know their business. Imagine this! This is a frightful thing! But what can be done? Jamming possibly, or more logically, invoke strict communications security measures -- a directive to this effect under penalty of a trial. Bring up this matter! Eliminate this source for the Soviet Technical Intelligence service! They get a lot of tactical material without agents. Don't give them anything. You

should establish the following discipline. Regarding conversations, use codes, special transmission means and above all when it is not necessary, maintain commo silence. Send written reports instead. This is a frightful thing! It should be weakened.

133. G: What is the Central Bureau of Political Information? S: The Central Bureau of Political Information exists but it's a Directorate, not a Bureau -- Directorate of Political Information. It is subordinate to... G: The KGB? S: No. All these Directorates that have their own representatives abroad are subordinate to the Central Committee of the Party. They collect information, and then publish a special bulletin. Some bulletins have a red classification indicator; some are black. The red indicator is Top Secret. All information on you from intercepts, information obtained about your policies clandestinely, are all under red indicators. Of Special Importance! Black indicators also cover Secret matters but of lesser importance. They publish this bulletin of their own. The politicians study it -- the ideas, the views, etc. This is the center where all political events are evaluated. Not economics, only political. Military matters are separate. G: I understand.

134. G: Who is in charge of the Committee dealing with (persons) going abroad? Is it KGB or the Central Committee? S: KGB. G: Not the Central Committee? S: One moment, in the Central Committee there is Commission for Departures. The Commission for Departures is attached to the Central Committee, but it is staffed by the KGB. They have the positions of instructors, and the instructors are members of the OBKOM of the Party. Colonels and Generals sit there. The execution of orders from this Commission for Departures falls on the Administrative Department and from the Administrative to the Military Department. Did you know that the Administrative Department is the Military Department? G: Yes, yes. S: They are ashamed to say that there is a Military Department in the Central Committee so it is called the Administrative Department as though they were busy with paper, pens and ink -- administratively -- but it is actually military.

135. S: KRUTOV is in charge of the Department; MIRONOV was there before him. Now he is Deputy Chief of the Academy. Nikolay Mikhaylovich MIRONOV was formerly the Chief of the Directorate of the Moscow Military District. I worked for him as senior instructor. Now he is Deputy Chief of the Academy. He lives close to me. He is also a good source. I christened his son. G; G: So you soldered the KGB to the Central Committee of the CP/USSR! S: My God! It's kept secret that there is a Commission for Departures. I had to go before I could leave for Turkey and I was called there when I was to leave for Pakistan, when they were checking on me. I was ready to go to Pakistan, I told you.

DUBROVIN got the visa. DUBROVIN was later discharged. He was the Head Instructor of the Department of Military Diplomatic Service at the MDA. Now it has been incorporated into the Department of Special Training (SPETZ-PODGOTOVKA). The head was General LISITSIN. You know him. G: Yes. S: He was discharged.

136. S: So this Commission exists. You are called before it and [illegible] given forms to fill out. The forms have the classification Top Secret when filled in. The first page reads: "I a citizen of the Soviet Union.... that I won't betray my trust, etc., etc.," (All laugh) S: The second one (form) is for information. You complete them and they are taken to the Instructor. The Instructor reads them and calls you up. "Well, Comrade (Subject's true name), we have great hopes for you, hurrah!...." Everything to make the person feel he is in the highest organ of the Central Committee. An ordinary person briefs you. Of course, not VOROSHILOV! (All laugh.) S: Everyone is given instructions to read.

137. S: What do the instructions contain? They are very interesting Top Secret instructions. To uphold the honor, etc. This even is mentioned -- if you are traveling in a train abroad, you should sit in a compartment with others of the same sex, i.e., a man with men, a woman with women, so that a man would not sit with a woman in a Capitalist country. (All laugh) S: Demand this from the (R.R.) conductor. Under no circumstances should one travel in a compartment with both sexes. It continues this way: Don't drink too much; don't talk too much. Report any case of provocation to the Ambassador, Counsellor or VOKS representative, depending on who is available. Don't take any Secret materials with you! (All laugh) S: Don't make any notes. If notes are made, then carry them with you all the time; don't leave them any place.

138. S: Here is a good case. It can be written up in the press. I give you my permission. Let them think how you got it. Two months ago we sent a GDR Delegation to the German Federal Republic. An engineer from Leningrad was sent along. He was slightly sick mentally. He made notes in an agent notebook like mine. He was not an Intelligence man; he was an engineer. Possibly he was coopted; I never found out. We did not coopt him, possibly the KGB did. He put the notebook in the pocket of his overcoat and forgot it in the car when he got out. He got the overcoat back but the notebook was missing. He became so upset that when his comrades went shopping he hanged himself. He used the cord of an electric iron which he attached to the electric fixture hook on the ceiling. They had taken a portable iron to save money on pressing. He used the cord from this iron. The body was flown to Leningrad.

G: He became scared? S: Yes. He hanged himself. He had a good wife and two children. They said that he was mentally unbalanced; he took it too hard. He was a fool, of course. But he did hang himself. The others returned and found him dead. It was two months ago. We were all called together; it was a big affair.

139. S: They didnot want to let DOBRUR come with me. He is a Latvian from Riga. This is the 2nd time he has come here. He is not married; that's why they did not want to let him come. But since he had been in England before, they did let him go. I did not want any changes in the delegation. It could change my whole life. I said that he had a mother and that I would take personal responsibility. He was in England before and did not defect. Why were they afraid this time? Because a Latvian defected some place recently. S: Do you know that a Latvian defected? G: I didn't know. S: Well check! A Latvian defected recently! He was with a delegation and did not return.

140. G: Is there a committee or person who is handling our defectors MARTIN and MITCHELL? Are you familiar with this? S: Of course, I'm familiar. They are handled by the KGB. They are under their control, their protection, and they provide for them. But I personally feel that they want to return very much. (Laughs) G: Did you see anything -- their questioning, etc? S: No. G: How did they get there? What was the travel route? S: They were vetted (RAZRABOTANNY) beforehand. That's what I heard. G: You mean here in the USA? S: Yes. G: Then they were given the opportunity and... S: They were given the opportunity, but they were vetted (or developed)definitely. G: By whom? Do you know? S: I don't know. Not ours. Not the Strategic Intelligence. The neighbors (KGB),of course. S: Yes. Definitely. I know we had nothing to do with this. KASORIN told me, "(Subject's true name), we have nothing to do with this matter, unfortunately. It would have been a big plus." The neighbors (KGB) arranged it.

141. G: Whatorganization takes all KGB and your (GRU) reports and collates them for final use by KHRUSHCHEV or someone else? S: The system is simple and clear, very easily defined. All important telegrams go "via the top", i.e., KHRUSHCHEV, and then the Minister reads them. All telegrams from the KGB and from our Chief Intelligence Directorate, etc can go "via the top". The Heads of the Directorates sign off if they go to the top or if they should be held at some level to the worked on for incorporation into further reports. Some may merely go to the Information Directorate. They route them. The signing off for us is done by SEMOV on the important ones,

they then go to the Minister. It may happen that the REZIDENT, the KGB or our (GRU man) will write: To Comrade STALIN, to Comrade KHRUSHCHEV, Comrade MALINOVSKIY, Comrade SOKOLOVSKIY, the Chief of the General Staff. He writes to the top, going over the head of his supervisor. We write everything to SEROV, but we can address it directly to MALINOVSKIY. In that case, it will definitely go to SEROV first.

142. G: Who prepares everything so that it will be clear to the minister? S: The telegram is read in its original forms, also the signature -- (say from me). There were such telegrams; my telegrams were read, etc. -- such as information (telegrams). The original is read. Then all the material is pulled together in the Central Committee -- let's say regarding Anglo-Soviet relations, for example. Then it is given to the MID. If there are many questions or a note, an announcement is prepared. In other words, everything is pulled together at the top, in the Central Committee. The Central Committee gives it to the MID or to some other Ministry, depending on the type of information. There are some telegrams that never go to the top. They are stopped at SEROV's office or at the desks of the Heads of Directorates. They give them to the action party. G: You mean administrative telegrams or those which are sent if there are new summaries, or additional data, which is to be collated into a new report? S: I understand. The Military Attache prepares a yearly report on the combat readiness of, let's say, the English army. What new units exist, deployment, new technological developments, training if we saw it or if our neighbors (KGB) gave us this type of material. All these reports, summaries, are collated and given to the Minister in the form of a report. The Information Directorate prepares this. G: And the KGB? S: That's for the Minister of Defense. The KGB does the same thingthere. The KGB also has an Informatiim (Directorate). They also receive information and have to think it out and decide where it has to be sent. G: That's clear. S: What has to be incorporated into the general information? I repeat, the information comes in as cables and then as reports.

143. H: Now that the questions are finished, let us show him some photos. G: You answered very well. You answered an awful lot. I congratulate you! Because the questions were not simple. It was difficult to answer them. S: I am not prepared of course. If I had prepared myself I might have been able to give more theoretical information. G: What we are interested in finding out is what your general knowledge covers. One can't know everything that is happening in life. S: It is the duty of an officer of the General Staff to know a lot. (All laugh) Maybe some answers were not exact. G: But you did

very well. You said when you did not know something. This is natural. You're not an encyclopedia. S: I will tell you this. If I only knew the ARBAT or the Committee, if I only visited the ARBAT or the Committee, I would probably know only about Strategic Intelligence. This is my field; I was taught this. G: That's clear. S: But I have a wide circle of friends. If I want to find out something about a given field I always can -- either in general or in detail. G: That's why we are trying to find out your fields of knowledgeability.

144. (The packets of photos were now prepared for Subject to identify.) H: Q145. S: He is an officer of the Strategic Intelligence. He worked in the Information Directorate. That's all. You didn't bring PAVLOV's photo? G: He is not in this set.

145. S: This one is Strategic Intelligence. H: Q160. S: He is a low-ranking one, a radio operator (RADIST) or something. He has hopes for something higher.

146. S: This one is the same -- GRU. A high-ranking one. H: Q165. S: What's his name? I know him. He is stocky. I saw him running around. He is operational, not an Information Directorate officer. Write 2nd Directorate, that's under KONOVALOV.

147. S: No friends, maybe I will find someone. I have not seen ZOTOV yet. ZOTOV is not here. G: It's possible that he is not there. I thought that he would be there, but if you did not see it. H: What series is this? R? J: Italy. S: Here he is. We met him. He is an officer of the Strategic Intelligence. H: R-97. S: A young one. He entered the Academy while I was there; I don't remember the year.

148. H: R66. S: A radio operator - code clerk (RADIST-SHIFROVAL'SHIK). He might be under cover of courier-guard. We never state in the passport that a person is a code clerk; we say courier, guard, administrative worker, etc.

149. S: This one is a neighboring worker (RUS). H: R62.

150. S: This one is one of our Strategic Intelligence officers. H: R42.

151. S: This is one of ours, a naval one. I know him. H: R-40.

152. H: R18. S: A chauffeur of the Strategic Intelligence. He was at the school/base undergoing training.

153. S: Works for Colonel AVRAMENKO, his worker, an officer. H: Rib. G: Of the same type as the other? S: No. He is a case officer, an operational worker.

154. S: Have you noted what I told you -- that Lt. Col. FEDOROV should be removed. The Military Attache in Iran should be removed and his frightening assistant NIKOLSKIY, a very good natured fellow, a major. He is under cover -- a 2nd secretary, I think. I don't remember.

155. G: Have you heard of BUCHICHEV? A colonel? No, I don't remember. VAVILOV should be removed from Istanbul. He has many connections there. Len'ka is a nice fellow. He should be removed. VAVILOV, a neighbor (KGB) should be removed because he operates well in Istanbul. He has lots of connections, many friends, an operational worker, case officer. Check on this yourself. Don't forget to establish direct surveillance.

156. S: Officer of Strategic Intelligence. H: Hy. S: If this is Sweden, there has to be a Colonel here -- the one who gave me the examination after the 1st course. He is working with the 60 students now. He was a Military Attache. H: In Sweden? S: In Sweden. G: Maybe you will find him. S: He examined me.. He is in command of the 60 students now. They were very sorry when I left. My typist told me. She said, "They liked you so much". I made them use their brains well, yet I was human.

157. S: I forgot to mention about apartments. I wrangled 30 apartments for the students from KHLOPOV. His wife died when I was graduated. He is Red like a samovar. (All laugh) G: I'm like a samovar. S: No, I'm not talking about you. You are just a healthy person. You have lots of blood -- like bronze. (All laugh) S: He is driven in a car, a ZIM. He is very stocky; you are better looking! (G laughs) S: But it is not worthwhile taking a photograph for a portrait.

158. S: I was across the street from the main gate of the American Embassy. There is a house which is a clothing store and haberdashery. I bought a lot of soap and underwear there. I would look out the window (at U.S. Embassy) to see if the policeman saluted. When he saluted, I knew it was a diplomat. I knew, almost from the moment I saw him. Then I would walk parallel to him and think to myself -- when he gets into the car I think I will get in also. Then I would tell myself, "No. Don't be a fool. He might call a policeman." (All laugh) S: At one time, I followed a poor girl -- yellow socks and a yellow hat. (All laugh) If you would clear this up, I would be very happy. (All laugh) She had to report this, that there was surveillance on her. She was a good-looking American girl, tall, good-looking!

#12

159. H: Hl8. S: 100 percent guarantee - ours (GRU). You see, he must have an Intelligence connection, but I don't know him by sight. Of course, it's the Military Attache's office (VOENNIY APPARAT) so he is an officer. I don't remember what he looks like.

160. S: I have another goodfriend, YANCHENKO. He went to Africa. A Colonel. He has always worked as a reporter, but he is a Strategic Intelligence officer. A senior officerthe same as I am. He worked at the Academy when I was in command of a course. He is a nice, good-natured fellow. He was very nice to me. We drank and went to parties together several times. He was called out urgently, and he went out as a TASS correspondent. TASS is used as a cover. Everyone has cover. They place either KGB, or our officers, in the slots. We have people under cover of Torgpredstvo, G.V.S. (Civil Airlines), TASS, etc. YANCHENKO's wife came home for an operation: She called my wife and said, "We got a bad post. There is nothing to eat. It's frightening". He is with Sekoure Toure. H: That's Guinea.

161. G: Do you rememberthe name KOTSUBA? S: Of course. KOT-SU-BA. G: He came from Germany; he was in Intelligence. S: I remember. G: He was with you, then he left and was Deputy Commander of the city of Berlin, under the Commandants' office. S: He is a genuine officer of the Strategic Intelligence. I think he never left and is still working for us. I remember the name and his face slightly. G: He was fat; he liked to have a drink. S: That's him -- KOT-SU-BA. G: Exactly.

162. S: This one is a code clerk or a radio operator. H: #49. S: Probably not a code clerk, but a radio operator. This one has something to do with OSNAZ. He is at the Center studying radio techniques.

163. S: I am not identifying many people today. Nowhere have I seen an old Intelligence officer.

164. S: I know BOCHKAREV. G: Do you know him? S: He studied with me at the course, in the Fall of 1953. Now he is working for KUDRYAVOV. He goes to Germany, checks dead drops, etc. He helps establish dead drops, carries money, etc. Write this -- BOCHKAREV. He is the 97th (of Subject's MDA class of 1953). He wears glasses.

165. S: Check about Colonel PARKHOMENKO. He is some kind of relative of YERLENA's stepfather. The one who defected in Germany, or the one who was captured before he fled, SALDANOV. The one who married the daughter of a General. G: I did not hear of this. S: SALDANOV, they say, was caught before he could defect and they shot him. A friend of SEROV. The relatives don't know themselves what happened.

166. S: I recognized a lot of MID workers. I didn't point them out to you. I know many from MID. What's the matter? FEDOROV is not here and this BOCHKAREV...G: BOCHKAREV is Victor Viktorovich, isn't he? S: How do you know? I can't believe it but that is exactly right. The little one who wears glasses. No listen -- when did you leave Moscow? (All laugh.) S: When you come over, come and see me. (All laugh.) S: To sit with you. We will really accomplish something. Victor Viktorovich, that's right. G: I will check several names with you later. S: He studied with me; he finished in 1953; he is very nice to me. He saw me before I left. He is a Lt. Colonel. G: He was in Austria? He travels? S: He said he was in Germany several times. He said he went on a call of nature and checked a dead drop in the ruins, in Germany. You are right. He was also in Austria.

167. S: Do you know KHLOPOV? G: I even know his name and patronymic. (All laugh.) S: Poor KHLOPOV! If he only knew how many times we have thought of him, at this high level of ours. (All laugh.) S: Especially since he is the same height as you. His face is very similar. When he works he wears glasses; otherwise, he doesn't wear glasses. G: You see it's the same, without glasses. S: By the way, I want to confess now. When you were first briefing and talking to me, I thought that you were KHLOPOV in disguise.

168. G: Do you know ZVEREV by any chance? S: Write this down. He graduated from the Academy. G: He graduated from the Academy. He is a big fellow with a red face. G: Yes, yes. S: He had some kind of trouble at work. G: He is Victor also? S: Yes, Victor. Correct. He graduated in 1953. At present he is working at the Center. They want to train him for duty some place abroad. He works in KONDVALOV's 2nd Directorate. He studied with me.

169. G: Do you know this big fellow, RADIN? He is a huge fellow. S: I don't remember.

170. Note this one. He is a Strategic Intelligence officer. S: J-57. S: I don't know what his job is there. He might be stable boy; I don't know.

171. G: Do you know the one with a Georgian name? KHARLAMPIDI? S: No. Is that his correct name or a nickname? G: I don't know.

172. G: There was a YELSUKOV. S: No. You can write this down. Another person who studied and graduated from the Academy with me was FEDOSOV. He was 2nd Secretary in Tel Aviv, Israel. An aviator. At present, he works in the 1st Directorate of the General Staff.

173. S: Write down a few more of my classmates. TITOV graduated from the Academy with me in 1953. He is a Colonel now. He works in the 1st Directorate. He refused to go to Italy under cover. He said he wanted to be sent as an Army Attache, a real warrior. G: The 1st Directorate of the General Staff? S: Yes, the Operations Directorate. I remembered him. I have to recall all my 98 classmates.

174. S: This one is in the 4th Directorate of the Strategic Intelligence. H: J-39.

175. S: An officer of the Strategic Intelligence. J: Aleksey MYAKESHEV S: I don't know him well; I only know he is in the 4th Directorate. MYAKESHEV, yes? J: Yes. MYAKESHEV is J-39. S: I know him. I say "hello" to him, etc. He is in the 4th Directorate now, this MYAKESHEV. He graduated from the Academy later than I did.

176. G: Do you know a BELYAYEV? He was supposed to have studied with you. S: No. There was no BELYAYEV in my class. He might have been in another class.

177. S: Now write this. I just remembered; this one is very interesting. SALOMATIN, Fedor Fedorovich. He was in America. A neighbor (KGB), he graduated from the Frunze Academy with me and entered the Military Diplomatic Academy in 1950. I entered in 1949, and he entered in 1950, a year later. He studied in the same class with IONCHENKO, a neighbor (KGB). He was in America. He worked poorly. He worked in the Consular Department -- SALOMATIN, Fedor Fedorovich. His wife is Katya. They say she bought about 100 nylon fur coats for resale. (All laugh.) S: I remember him because he is being prepared to go abroad. The neighbors (KGB) discharged him. He worked in the PVO of the Moscow zone. He also worked there before he went to the Frunze Academy. He is working there again. When I was processing to come here, I went to ARBAT often and met him. He is being transferred from the neighbors (KGB) to our organization. Even this combination is passable. I did not have a chance to find out where he was going. He was in America about 2-2½ years. He is of the same graduating class as Sergey Sergeyevich.

178. S: Show me photographs of the ones who were in America before. I will show you which one is now the Counsellor in Delhi, India; he is operating with difficulty there. He is the one who told me that there are two REZIDENTURAs in New York and one in Washington. G: Yes. S: Give me his photograph; I will remember his name at once. We are doing this in the dark somehow. Can't we ask India to send lists? I could point out at once the one who went there as the Chief Assistant/Military Attache, the one who was to have been with me. In India. A Lt. Col. who graduated from the Academy with me. He is a big good-looking fellow -- Sergey Sergeyevich -- and has a beautiful wife.

179. G: But are they legal REZIDENTURAs or illegal? S: No. Let's clear this up; we don't understand fully. All REZIDENTURAs are illegal, in general, because they are conspiratorial -- illegal. G/M: Of course. S: There are REZIDENTURAs that are staffed with Case Officers that are under cover or are in an overt official (APPARAT) office of the Military Attache. They have agents and persons whom they are developing. They meet with them and give them money.

180. S: There are also illegal REZIDENTURAs, that our legal apparatus does not contact. They only provide money, radio equipment, tapping-intercept equipment -- all that is needed -- through dead drops. The REZIDENT of this network is also illegal and does not contact the legal network. He has his own communications channel to Moscow; or an OSNAZ station, using the radio given to him. For example, New York has direct communications into the office next to the one occupied by General SOKOLOV. I showed you who worked there. Now to make absolutely clear -- the illegal REZIDENTURA is composed of either American agents or persons that we sent in. But we have not let them make contact. G: These are the ones you are talking about when you say there are two in New York and one in Washington? S: No. In New York there are two. One is the network using the UN as cover -- where MELIKH was. They have their agents for contact. The other, completely unknown, REZIDENTURA is never contacted. They only get money from us through dead drops. Even the REZIDENTS might not know each other. G: I understand. S: The agents in the illegal REZIDENTURA not only spy themselves but they may have their own deep cover agents. They only have communications with Moscow. That's the kind of REZIDENTURA it is. I wrote the Otpechkovyanna; it means the one which is cut-off. G: That's clear. There is just one -- or more? S: Just one.

181. G: There is no such REZIDENTURA in Washington? S: There is none in Washington. There is a very weak agent network in Washington. They have limited opportunities. It is made up of old agents -- leftovers -- trash. They are handled by our Case Officers from the Strategic Intelligence in the Office of the Military Attache in Washington, and by 1st and 2nd Secretaries, Attaches of the Embassy, etc.. An Embassy Attache can be a KGB or a GRU officer. G: Yes. S: Now we have settled this. Otherwise, I wouldn't sleep quietly -- I will start writing letters about this. G: It is all clear. S: So there is one in Washington; there are two in New York. The Soviet Strategic Intelligence has three REZIDENTURAs in America.

182. S: One of them has no connections in any way. No one sees them and no one will see them. There are no meetings, no control, no telephone calls, or anything. Money is sent over and put in a dead drop. In some cases, it doesn't even go through the legal people. It is put in a dead drop by some traveller and the REZIDENT or an illegal agent will pick it up. I think, personally, that the network is made up of illegals sent in from other countries -- from South America, Germany, any place. It is organized. All the agents have been pulled together. They contact each other. They have means of radio communications, money and other materials and valuables, needed to work -- and they work. One may be a barber; another may be a waiter; the 3rd in military service. G: That's clear.

183. G: Do you know what the KGB has there? S: You see the KGB also has illegal REZIDENTURAs. I don't know what they have in America. They also have illegal REZIDENTURAs that are in contact with them and fulfill

[redacted]

their requirements. They also have these conspiratorial (cover) REZIDENTURAs, but they are directed by KGB (neighbor) officers who are in Washington -- again, the Counsellor, the 1st Secretary, some Torgpredstvo employee, etc.. Like MELIKH. What was MELIKH's title? Employee of the United Nations! G: That's clear.

184. S: Now the problem that bothers me, and all of us. The REZIDENTURA has direct radio communications with Moscow. They have a powerful station, a special frequency, a transmission time-table. To intercept the broadcast, determine the location, catch, and shoot them...There is such a REZIDENTURA. I think it is composed of non-Americans. This is my opinion. I can give my opinion; I must give it. The reasoning is because analogously there is nothing in Turkey. Please listen to this again, carefully. SUDIN is going there. Illegal agents will be sent in. They will be brought together into an organization. A REZIDENT will be appointed. He will be financed and he will work. They will set up the illegal REZIDENTURA in this way. There are no valuable agents who are Turkish, etc.. Why is SUDIN going there? Because the emphasis is on illegals. In places where it is hard to recruit agents, they will send in agents and will operate using the illegal means to carry on their Intelligence work. G: That's clear. S: Let SUDIN go there. You might uncover something. He is going to Turkey as a Counsellor; a slot was obtained from MID (Pause.)

185. S: It is a frightful thing, the flexibility of the Intelligence organization. Report this and make your own conclusions. This affair with POWERS happened on the 1st of May. On the 5th of May, there was an order to stop all Intelligence activity. Money that was already in dead drops was not picked up; The hell with it! -- If we lose all of the agents; if they get mixed up or stray away from us; or if they are without money or feel abandoned. It was suggested that we contact the ones that were needed, but no! This was for prestige. This was a great loss for our Intelligence, but the hell with it! It benefited us otherwise.

186. S: Then a new order was given. Again they started reorganizing and carrying on Intelligence. Now the emphasis is for illegal Intelligence; all efforts are expended to this end. Any amount of money for training, penetration, etc...third, for radio intelligence. They are preparing special radio monitoring personnel. In other words, there is an emphasis on anything that gives evidence of success, and success is achieved. Drop by drop it, of course, gives a lot of information. You know this yourselves. It is a weapon that they have developed and one which we should cut down. We can localize and cut down to almost zero the number of radio-communications channels. I'm sure that this can be done with certain techniques, discipline, etc.. We can achieve our goal. If you don't believe that we get a lot from this source, how can I prove it to you? Illegals! Please -- I can give you a lecture. I named personnel, SUDIN; what exists in Washington and New York.

[redacted]

187. S: This Sergey Sergeyevich has me confused. Where is his photo? H: We will find him. S: He is Counsellor in Delhi now. How many Counsellors can there be -- two, three? Give me the name and I will recognize it. It is a good Russian name.

188. J: A tall Colonel. H: J-26. S: An experienced Case Officer, he graduated from the Academy before me. He is a clean GRU man, not KGB. He is either an Artillery or Tank officer, not Infantry.

189. S: I don't see many from Pakistan. I know all the Case Officers in Pakistan; I have not found a single one of them. I can give you their aliases and pseudos, and you don't give their photos to me. Either you don't want to know or you know already -- good! (All laugh.) S: Officer of the Strategic Intelligence. H: J-14.

190. S: Here he is! H: J-12. S: Here is Colonel FEDOROV. He graduated with me from the Academy in 1953. His wife divorced her first husband; he is her second husband. She had cancer in her left breast and it was removed; she wears a "falsie". They have two children. He worked in GAU for Marshal YAKOVLEV. In 1949, he came to us at the Academy from GAU. He was in England. He was not too successful here (in England). He did not recruit anyone when he had operational requirements. Now he is Military Attache in -- what country is that? H: Holland. S: In Holland -- Military Attache. He is not the REZIDENT there; he is a consultant. Write this. He is a candidate for Technical Sciences; he got it at GAU. He is a foul, crafty fellow. He was nasty towards his comrades. He is not the REZIDENT; by law, he is definitely not the REZIDENT. No matter what. If he is Military (Attache), he is not the REZIDENT. He is consultant to the REZIDENT because he is smarter than the others. Remove him from there.

191. S: His Deputy Assistant. H: J-11. S: You see how they are together.

192. H: India! S: Good. By the way, the Military REZIDENTURA in India has the following task. I will give you the agents; there is a REZIDENTURA. The agent net is on conservation. There is a radio operator with everything cached. There are two brothers in the agent network. What contact do they have with the Case Officers? They get money; we feed and support them; we check their health etc. so that they are always available to put the radio in operation. Mr. NEHRU should be told this. All is held in reserve. Everything is cached in zinc boxes that are soldered and are air tight.

193. S: This is a low-ranking worker. H: P-83. S: Technical, GRU. Are the latest ones here also? Sergey went with them in about September. Sergey Sergeyevich who was in my class. I have not found him yet.

194. S: Chauffeur. H: P-64. S: This is my code clerk. He was in Turkey with me. H: P-49. S: NEVZOROV, he was in Turkey with me as a code clerk until the beginning of 1956. He was formerly in OSNAZ. We have a big

OSNAZ in Chita, a huge center in Chita, Baikal. At the center, while I was saying goodbye and asking ZASORIN what I should bring him, a cable arrived in which NEVZOROV asked that he be transferred from India. His older son has to attend school, or he does not like it there. I know him and his wife. He is a good, very calm fellow, who does his work well. G: What is his rank? S: Captain. He was Senior Lt., now he is a Captain. While I was there, a coded telegram arrived asking that he be transferred. The matter is being looked into now. He will be replaced. NEVZOROV, code clerk, experienced, an old hand.

195. S: Senior Assistant of the Military Attache. H: P-26. S: He graduated from the Academy with me. Lt. Col. in the Technical Troops. He was abroad before. He is a Senior Assistant to the General. He went to India, circa September. What is the first letter of his name? J: Aleksandr. S: No. The last name. He is my colleague -- the first letter! J: K. S: The second? I don't remember. J: K-O-R S: KORYAKOV! No, no. J: KORYAKOVSKIY, I think. S: KORYAKOVSKIY! That's right; he graduated with me in 1953. He was abroad before. This is his second tour abroad. He was as Senior Assistant to the Military Attache. He worked in the Information Directorate before his departure. He is a clean officer of the Strategic Intelligence. KORYAKOVSKIY.

196. S: A worker of the Strategic Intelligence. H: P-114.

197. S: It would be nice if General of the Army, SEROV, would come in now. By the way, SEROV suffered a lot when he was appointed to a position with a lower rank. He was a Minister of SSR and now he is a Chief in the General Staff. He isn't even the Chief; he is Chief of Intelligence.

198. S: Here is Sergey! It did not come out well. H: P-123. S: What is the first letter in his name? I want to recall it myself. It is very bad photography. I recognized him by his good-looking wife next to him. He was in America for a long time, about 3½ years. What's the first letter? J: V-E-Sh...S: VESHCHUNOV. J: That's right. S: Hold it here. She is a good-looking woman. He is her 2nd husband; she divorced the 1st one. I will find the one whom he replaced now; he is working with me in my OTDEL.

199. G: TSAREV? S: No. TSAREV was the Military Attache in Afghanistan...

200. S: I don't see Petr GANICHEV here, who is the Senior Officer in the 4th Directorate running India. He replaced me. It is a poor photograph. He was in America 3½-4 years as 1st Secretary.

201. S: Strategic Officer. H: P-142.

202. S: Strategic Intelligence. A Major. H: P-147.

203. S: Where is GANICHEV, the one who replaced me as Senior Officer? He was Senior Assistant to PAVLOV, the Military Attache. Do you have any more photographs from India? J: No. S: I can't find the Counsellor whom he replaced. This one was a First Secretary but he was given the Counsellor's position. He was also a Colonel. S: This is the Major General, the newly acquired Military Attache. KORYAKOVSKIY is his Chief Assistant. G: Isn't he an Intelligence officer? S: He's "from the troops". He's as much an Intelligence officer as a dog's 5th leg. (Laughs) It's incomplete. Petr GANICHEV, who was PAVLOV's Assistant, is missing. PAVLOV is not here, the Military Attache who was replaced by the General. You see how incomplete it is. Three Strategic Intelligence Officers are missing. H: We do not have every card. S: Please write this down -- PAVLOV, Military Attache, India, Strategic Officer working in the Information Directorate for a long time. He is a Colonel.

204. S: Then the 2nd one missing, Denis POLYAKOV. He is the one whose wife lived with the Commercial Counsellor; he graduated from the Academy with me.

205. S: The Colonel, who was Counsellor, is missing. I don't remember his name. He was replaced by VRSHCHUNOV. VRSHCHUNOV is missing. Four are missing. Write it down, because when I am not here you will say (Subject's True Name) does not remember. If you wish, I will look through it again. Four Strategic Officers are missing from this group. I have a good memory and I know them all well. Colonel Petr GANICHEV is also missing. He was transferred because he had a malignant tumor. He was operated on and now he is feeling better. He is working as Senior Officer of the 4th Directorate in charge of the India area. He replaced me. Another one is missing -- Assistant Military-Air Attache of PAVLOV, the one who was in a car accident outside of Delhi. He broke his spine and ribs and was taken to Moscow by air. I don't remember his name, but I remember what he looks like. Five officers missing. Do you recognize this one who was in Washington? J: Yes. S: That's not bad.

206. S: The Military-Naval Attache had one of these cameras. You say this camera is expensive? G: Yes, it is. S: I was told that it is quite expensive.

207. S: What shall we do? G: Go to bed. Tomorrow we will meet at 1600 hours as agreed. It will be a short meeting to clear up everything. Please don't forget to call [redacted] in the morning. S: I will call him and will go visit him, maybetomorrow. G: Yes. You have to get this.

S: Tomorrow I will go to the Embassy; then I will go to the nightclub. The day after tomorrow, I meet the REZIDENT officially. I will give him the materials about the mnemonic and electronics. G: At what time? S: I will be told tomorrow. H: Okay. S: Tomorrow I might be able to find out from SHAPOVALOV about the agent's message. G: When do you expect to call [redacted] S: The day after tomorrow. I will settle everything concerning [redacted] when I meet with the REZIDENT. Tell [redacted], if he calls. I will call him myself tomorrow. H: He must ring up tomorrow! G: Yes. He will do that. Have you set up a tentative time when you will meet him? S: The Counsellor (REZIDENT) will tell me whom he plans to appoint as the contact for [redacted] I will report everything to him. I will show him the materials you have given to me. G: But when you talk to [redacted] over the telephone, won't you arrange for a meeting? S: No. Tomorrow, when I talk to [redacted] over the telephone, I want to meet [redacted] and then arrange it personally. H: He must ring up to arrange this. G: Yes, I know. H: Otherwise, you see, [redacted] may not be available. We can't keep the chap here you see. S: I will call. G: He will do it. H: What time tomorrow? G: 1600 hours. A very short one, just before he goes back to the Embassy. H: 1600 hours. G: You said at 1600 hours, yes? S: At 1600 hours. G: Okay. We won't keep you long because you have to wash and get ready to go with them. S: Yes. Tomorrow I will dance. G: We can't keep him too long. He has to meet his group.

208. S: Now, I will spoil Mr. Herold's mood. I was told that it costs 450 to go to a nightclub. I was told it costs 10 to dance with the girls, and that the tables cost a lot. He (WYNNE) said 450, so that I would pay for him also. I saw him move a pile of sand from the street into his yard. He paid 18. He is building a house. G: Yes. S: I presented the suit to his wife today and she danced with joy, just like a goat. (All laugh.) S: I was very glad that she was pleased. She is a very pleasant woman; she is nice to me. She really helped me. Was I right in doing this? Yes, I was! G: Yes, of course. S: I'm a kind person. H: We are not criticising this. S: But it is a fact. G: But you are taking gifts, etc.. That's also important. H: Of course. Everything is in order with this. S: I was only thinking what your supervisors will say about the 450 that I spent in the nightclub. G: No, no! S: You gave me 1250. I will sit for another five minutes. How will I say goodbye to all of you on Friday. It will be hard and only the fact that we will be working together will help me morally. G: We will meet again soon. S: Well, I think it's time to go now. (Farewells are said. Subject left at 0030 hours on 2 May 1961.)

[redacted]

Meeting #13 (London, 3 May 1961)

(Subject arrived at 1310 hours on 3 May 1961 at Room 360 in the Mount Royal Hotel in London.)

1. S: (Looking at the various items of medicine obtained for him) I'll not put anything in the suitcase now. You have a lot of work ahead of you Mr. Harold. I just had a talk with the REZIDENT. At 4:30 I left the girl. God knows how I was able to accomplish everything. I saw the REZIDENT; I had a talk with SHAPOVALOV: I had decided everything; I had clarified everything. H: That is fine. S: But there is so much work to do. G: How much time do you have at your disposal? S: We'll work for an hour and a half or two hours. I sent the delegation to the Exhibit. They will be working there and [redacted] is with them. I arranged this to come here.

2. S: I has spent the whole night on my feet. But then how the night had been spent! I was at a most luxurious cabaret. Could you extend my leave for about ten more days? (Laughter) I was at her place two hours. I left WYNNE there. There was WYNNE's friend, Norman -- a nice chap. He takes trips to Canada -- a very good friend of WYNNE's. He knows me as a Soviet representative and that is all. First we went to one club, then to the cabaret. The show started at one o'clock in the morning, very nice, classical, the music in Turkish style, as if to order.

3. S: They picked up a 23-year old girl for me at the club -- a good girl. She has a pretty name -- [redacted]. Her telephone number is [redacted]. Now, everybody knows it. (Laughter) I spent two hours with her. I had to get some sleep. At eight o'clock I had my breakfast already. G: Were you at her place? S: Yes, I was at her home. She has a separate apartment. Everything was modest, but good. She was a nice girl, somewhat experienced, but that was okay. She is twenty-three years old. H: Once more, [redacted]? S: [redacted] (all laugh). G: Did she charge you much? S: WYNNE said 15 pounds, I paid her through WYNNE. I do not think he would overcharge me and pay her ten pounds. She was told that I was Alex from Belgrade, Yugoslavia (laughter). We had a table there, everything was fine, WYNNE said that she wanted 15 pounds. I gave the money to him. He gave it to her and asked her not to ..... she didn't ask me for a penny more. I spent two hours with her. It was getting light.

4. S: I was up at seven, ate at eight and at nine we went to the embassy. We received our money. Then to the REZIDENT's reception. I spoke alone with him for 30 minutes. I had a talk with

APPROVED FOR RELEASE
31 MAR 1992

[redacted]

SHAPOVALOV. I told the REZIDENT all about my trip. I showed him my daily itinerary; I showed what you had given me (i.e., the brochures). He had everything packaged up, called the code clerk in my presence and sent it out. See what it means not to have shown me all photographs!

(5) S: Today I met a very fearful KGB man, VORONIN, Yevgeniy. He has been here two years already. There was no photograph and, if I had not met him today, you would not have known anything. I'll report on VORONIN separately, allright, in order.

(6) G: One more question -- could there be any consequences because of the girl? S: I do not think so. It's true that: WYNNE gave me a preservative, but I ..... G: This is important. S: Of course it is. I considered it. I came home and washed and everything. She was clean. I think she takes care of herself. WYNNE guaranteed her but at the same time, he gave me a box (laughter). No, no. Everything is okay. I exclude this. I have little experience -- I am responsible. G: There is a proverb, if one is unlucky .... S: One could get it from one's own sister. G: That's it. You know the proverb. S: I do not think so, but if anything ..... to get cured, there is nothing to fear, but I do not think so.

(7) S: So, the REZIDENT saw me right away in the morning, below, in the basement in room number 8. The bookkeepers are next door. This room is adjacent to the REFERENTURA. The main entrance to the REFERENTURA is to the right of the entrance, to the basement. This is all in house #13. I told him about the trip and showed him your material. Right then he called a code clerk. He brought an envelope and was told to put the material in the envelope and to address it to Colonel ROGOV, V. M. from Colonel (Subject's surname and initials). That will go out with the next mail on 13 May. G: What were the initials. S: V. M. Well, I reported everything to him.

(8) G: What is the name of the REZIDENT? S: He did not tell me and I did not ask anyone. The photograph which I picked out was he -- I'll risk my neck on that. But no one told me his name, not even he. I asked him whether there would be a package or a letter, I would be bringing back. He said perhaps there would be a letter for VORONIN, the Chief of the NAPRAVELNIYE. I could send that home. Why should I ask him his name directly? I know that SHAPOVALOV talks about everything. I did not ask him any questions and yet SHAPOVALOV told me the characteristics of those with whom he works. In a day you will know with whom SHAPOVALOV is working. G: That's good.

[redacted]

9. S: Look up the name of the person in the picture. The same one -- he is the REZIDENT. I've reported to him in detail about [redacted], the plan of working with [redacted]. Ops officer GENERALOV will be assigned to [redacted], tomorrow or after tomorrow. I'll know about that at five o'clock tonight. They are bringing GENERALOV to the embassy at five o'clock for me. I am to give GENERALOV all the data on [redacted] and to arrange the meeting for him to meet [redacted].

10. S: I want you to tell [redacted] about my plan. [redacted] had invited me to visit him, but why drink whiskey? If I had the time I would visit him with pleasure. I'll telephone [redacted] after my talk with GENERALOV. I'll ask [redacted] to come to the lobby of this hotel. We'll meet here. I'll call GENERALOV and arrange that -- we'll be drinking coffee. I'll tell him that [redacted] will be here and that he is not in his own town. [redacted] will come up to us and I will introduce them.

11. S: [redacted] should be told that I shall not come and visit him. I should not do this. [redacted] had asked me to see him, in general, to tell him everything. That I cannot do now. You told him everything and now I can't spare two hours. I'll telephone [redacted] tomorrow. Maybe [redacted] could make it tomorrow when GENERALOV would be here to see me in my hotel room. Later, we would come down to the lobby or the bar and [redacted] would show up at that time. I'll tell him the time and ask him to bring a few things, one or two items, and to say to me that he will mail me the other items on cement and steel that I requested. I'll say to him, "Mr. [redacted], why do that? Here is my friend from the GNTK in the embassy. Hand it to him." Then I shall introduce them and the deal will have been made. That is the plan. G: Fine.

12. S: Warn [redacted] not to call anyone himself -- never, not even GENERALOV, until their relations develop further. The REZIDENT would invite him through GENERALOV -- there will be an official invitation -- Let him go. I told them about [redacted] that he was an esteemed person -- he is educated, cultured, loyal to us. He had visited the Soviet Union two times. I said that we could not recruit him, and there is no need to do that -- . He is already 69 years old, but we could get information from him. As the REZIDENT had said, he would expect to get general information from him and so on. So, [redacted] should not be active; he should not show any interest. I ask you to report my request. They themselves will come to [redacted].

13. S: When they approach [redacted] with certain requests it would be up to [redacted] to figure out what to give them. He should conduct himself plainly but firmly because he could be asked many

[redacted]

questions. He could reply that despite his experience he does not know, but he could reply to some questions by saying that he was sure he was right. You understand. Later their relations would develop step-by-step. What decision they would come to, you would tell him about that yourselves. You'll direct him. I request that you brief him, I cannot do it, I do not understand him well. G: Okay.

14. S: So, GENERALOV should be waiting for me at five o'clock in the embassy. I'll take a taxi to the embassy, quickly arrange everything, and return to the hotel so we can meet again. G: Okay.

15. S: Another thing. SHAPOVALOV had asked me to his office when I saw him today. I asked him what I should say for him at the Center. He asked me to request the Center to permit him to operate more actively. As it is, he can work with the Indians (Hindus) only. I had supposed that he was working with the Indians. He knows the language brilliantly. I said he knows only two words in English and even that in the nominative case only.

16. S: An Indian correspondent had given him some data. There are several Indian correspondents here; there are many Indians here. You solve that yourself. Set up surveillance and find out who, and what has to be done. The Indian is paid by them; he is their agent. The Indian passed on the information on that day when SHAPOVALOV was the duty officer. The information was of a political-military nature, about some troop movements, about some new American bases here, and about deliveries of new arms to England. He told me in general terms. I did not display any interest.

17. S: I said that I could send a telegram to the Center, but he said to tell them only if the REZIDENT said to do so. If the REZIDENT does not tell me, I am not to say anything because they would chop off his head for telling me about it. So, those telegrams, and what I am telling you in general terms ..... He is right, the REZIDENT did not say a word, not a word. That means I'll not say anything. I asked SHAPOVALOV to tell me about the telegram so that I could remind them -- the general contents of the telegram, no details. Well then, the Indian -----. He knows the Indian language very well; he had been in India and knows the language well.

18. S: So, how, it is simple to find this Indian, and some thought should be given to what to do next. You'll expose the Indian and SHAPOVALOV could say that some information had leaked to (Subject's surname), that is what I am afraid of. G: Don't worry, we won't touch him. S: The Indian is a correspondent, a very informed person, a paid person. He did not tell me that. I do not

know whether he had picked him here or had contact with him in India. The fact is that he is his (SHAPOVALOV's) source. Just as I have been supposing, I am clever sometimes, sometimes, rarely but right. So, I told him, he does not know English, or he would be given a written report. If it were given in English he could not translate from English to Russian immediately. But he told the Ambassador about the contents right away. Therefore it must have been in Indian.

19. S: The next matter is most interesting too. G: Wait, and your material, the brochures, were they sent by the REZIDENT? S: Yes, the REZIDENT in my presence, called the code clerk of his REZIDENTURA, who brought an envelope. It was placed in the envelope and will leave on the 13th of May. The code clerk took it with him. There they collect diplomatic mail. I do not have the material -- I made the selection. He looked at electronics. There was a brochure on Nemonics. There was the one I picked up yesterday from Ferranti and the one you gave me on canning. Now, this is all on SHAPOVALOV.

20. G: How about MERRIMAN? Will be a plus for you if the REZIDENT transmits his report? S: Of course! When I return I'll write such a report! (Laughter). What do I need that for? G: Will the REZIDENT send one to his people? S: I had reported to the REZIDENT and he had made a note about MERRIMAN that (Subject's surname) and GENERALOV would meet you to discuss this matter, to arrange with SHAPOVALOV, -- SHAPOVALOV introduces me to everybody. When could it be done? I said that I would bring him at five o'clock in an automobile; he had an operation.

21. S: At five o'clock I'll have a talk. That will be written down and a telegram will be sent to Moscow. Then an operational report is compiled .... saying that (Subject's surname) had suggested that an acquaintance of his whom he had met twice, once in the USSR and once here -- plus detailed data about the acquaintance -- that he be used for getting information from him unwittingly. In my report I shall state I had suggested him to the REZIDENT and he was transferred to case officer GENERALOV. And I receive a small "plus" (laughter). That is the way it looks. This will all be in line with my program, my assignment. (Laughter).

22. S: Are my eyes red? G: They are beginning to be. S: But I do not want to sleep. To continue ..... The REZIDENT chatted with me for thirty minutes and told me the following things. He said it was difficult to work. When I asked him why, he said that recently an Englishman had offered some material of a military nature and had asked for 2,000 pounds. He had to have it urgently for a house, his personal needs. The REZIDENT said that he had

asked the Center. The Center replied as usual that it was too much and wanted to know whether the material could be obtained for study, but who would be fool enough to surrender the material? Up to now he said he had had no reply, and the person did not give him the material. This is a fact. An Englishman with military information wanted 2,000 pounds.

23. S: The REZIDENT is taking his vacation in June. Prior to his leave he will travel around the country. I asked him about that yesterday and he confirmed it. He told me himself that he was waiting for his replacement on scientific and technical matters, the Colonel whose photograph you have not shown me, PAVLOV. Had you shown me all photographs I would have found the one about whom I shall talk now.

24. S: This is the content of the conversation. He is pleased with everything -- is pleased with the Delegation -- that there were no incidents. I told him that toasts were drunk (seated) for KHRUSHCHEV and (standing) for the Queen (laughs). So he is pleased, and thanked me for everything. I thanked him. I have known him by face for a long time.

25. S: In my presence he told the code clerk to prepare a a telegram that Colonel (Subject's surname) would leave by airplane on the 6th. He asked me whether I had been given a pseudonym prior to my leaving. I told him that I had an old one but there wasn't any need for it when I travelled here. So, he told the code clerk to use my true name. The code clerk took my (hesitates) -- your -- material (laughs) and left. He said that he would write a letter, he could find me through SHAPOVALOV and asked me what my plans were. I told him there was an exhibit and then preparations. He said that everything was okay. SHAPOVALOV had reserved the tickets for the 6th of May.

26. S: Now, I left the REZIDENT and went for the delegation to house number 18. G: What time was this? S: I was with the REZIDENT -- at 9:05 we were at the Embassy, all five of us. I placed everybody in house #18 where PAVLOV sits, and where the scientific group is. SHAPOVALOV met me immediately. SHAPOVALOV and I had a chat. I told you about it. He went to the REZIDENT about (Subject's surname), and was told that he would see me immediately. Not more than 30 minutes with the REZIDENT. He asked SHAPOVALOV to leave. We had a conversation just by ourselves. There was only the code clerk he left later too.

(27) S: He started to tell me how difficult it was to work; PAVLOV has been away for six months; GENERALOV has this -- SHAPOVALOV does not know the language. He repeated the same thing again, but in brief. He said he wanted to rest and would send his wife earlier, -- that is, his wife would leave before him. We said our goodbyes.

(28) S: The bookkeeper came in as I was leaving. The bookkeeping section is right there, in house #13. He said that he would pay each delegate separately. I said that that would be fine. One delegate is paid from one account, another from another account. There is such a confusion that the devil himself would break his head. So I left for house #18 and brought the delegates to the bookkeeper. The bookkeeper calculated everything and gave us the money. The delegates and I were walking, same side of the street then to the right, to the Exhibit. As I was leaving house #13, the delegates, about three of them, were behind me.

(29) S: I saw Zhenya VORONIN pressing the button to the REZIDENTURA. I gave him a sign. He understood and we didn't greet each other. He and I had lived in the same house. VORONIN lived in house #36. His father is a General Major VORONIN, a political worker. He is now retired; he is not working. They lived near the MVD headquarters in the house of a friend. The mother had died. The father remarried and gave to him (Zhenya VORONIN) and his family a room in my house, on the seventh floor. His wife, who is here now and whom I also met, badly wanted me to pet her a little.

30. S: He wears glasses. He is near-sighted and wears thick lenses. He has a bad case of DIATRIYA, external signs. He is of medium height and on the skinny side -- not exactly thin, solid but not fat. He wears glasses. VORONIN has been here for two years already, KGB. He had graduated from the Diplomatic Academy in 1954. His basic language was Yugoslavian. He was preparing to go to Yugoslavia but for some reason did not go to Yugoslavia. English was his secondary language; it has been activated and he has been in England for two years now. Immediately after graduating from the Academy he joined the KGB. He is an active worker, impudent, daring. He should be watched very closely, more so because you have picked up may KGB men.

(31) S: This is what else the REZIDENT told me. That you had some kind of a lawsuit here and some one had received a 25-year sentence for illegal contact, for passing material, for spying. I do not know when that happened, recently or a year ago. He said that in general it is difficult to work with the English. The salaries are high, the life is good. When an Englishman is offered

100 pounds he says that his janitor gets that much but, when it comes to 2,000 pounds -- what that one has asked, why this is what happened. They say, "Let's have the material and if it is worth 2,000 we'll pay it." He said that in general the English are frightened. Their standard of living is high and they are frightened. Why should they take risks for 100 or 200 pounds, to put their heads under the ax, to be imprisoned? If one wants to take a risk then do it for large sums of money and our government does not pay large sums. They must produce rockets! You know, they want to grab two places with one hand. You know the expression; it is indecent. (Laughter).

32. S: He complained that they give too little money. That is the general situation, I know it exactly. If one asks for a large sum they do not ask to cut it in half, they say one tenth, one-twentieth could be paid. They have a tight fist on their money -- very interesting. There, in America, there was a decision by the Central Committee to pay $50,000 to bail out MELIKH. It was KHRUSHCHEV's decision and it was upheld by the government. There, this is only a detail, during the conversation he mentioned that someone got 25 years. He did not disclose to me who it was. I am listening and asking questions with my eyes only. Why should I display any interest?

33. S: He talked with me for 30 minutes and he had revealed to me matters about which the REZIDENT is not supposed to talk even if I am a worker of the GRU. G: Yes, of course. S: He complained. And what was the total sum of our conversation? He wants me to speak favorably on his behalf at the Center. This is a poor guy. One of his men is away, another one is ill, and another one doesn't know the language. Another one is a fool, that one says he is a Military Attache and cannot be active. He knows that I have contacts, that I am an old member of the group, that I would repeat everything. Of course I am not going to say anything; there is nothing to talk about. These were the contents of my talks with the REZIDENT and SHAPOVALOV and the deduction which I made about acquaintances of SHAPOVALOV. One of them is military, or a civilian who is working at the Ministry, who had asked for 2,000 pounds for military information. Who, of course ..... I would get into that safe with pleasure -- and would give 50 years .....

34. S: So I am passing by, and VORONIN is pressing the buzzer. I haven't finished with VORONIN yet. We acted as if we did not know each other. The delegates and I walked 200 meters and met his wife who was pushing a carriage in which was her two-year-old daughter. I told her ..... we use the familiar form of "thou". We used to kiss; I could do anything I wanted. She did not appeal to me: I

told her that in Moscow. There, I could never have run into her, but in London I did (laughs). We stopped and I introduced all the members of the delegation. Then I asked them to wait for me, squeezed her shoulder a little and asked her how she felt. The little girl was staring at me. She told me that I had grown older. I told her that she had changed also. Later they traded the room they had in house #36, my house, with her relatives. Her father had died recently, in Moscow. She said that she was planning to fly and Zhenya would go on leave in the fall. He is KGB, he must be watched.

35. S: You already had picked out and exposed (RASKOLOLI) -- that is very good. He is very active and undoubtedly has contacts here, I am sure of that. He has one man for sure and one or two active acquaintances. So I can say his abilities and characteristics are such that he is not the kind of man who would be sitting and not doing anything. He wears glasses, shorter than I am. VORONIN -- how did we miss his photo and PAVLOV's too? So, at five o'clock, I am repeating once more, I'll go to get acquainted with GENERALOV, officially, and brief him about MERRIMAN. Tonight I'll inform you when GENERALOV will come to see me.

36. S: Everything is going according to plan. I visited the cabaret according to plan. (Laughter). Everything is done according to plan. I would say that you are helping. The girl is playful -- interesting. She knows English only. She was born in London, I would ask her how to say things in English and she would say how do you say it in Yugoslav, and I would say in broken Russian and she would repeat (laughs). Okay, that is all. Do we have a right for a minute of rest?

37. S: I have a question. Now suppose someone contacts me? What will he call me? What would be my name? Will he call me Alex, Paul, Peter, Joseph? G: First of all he will say, "How do you do? Greetings from Colonel PEEKE S: (interrupts) - Well, how will he talk to me? We address each other. I would like to have you give this some thought. G: If you meet people officially .... S: (interrupts) They'll know me officially as Mr. (Subject's surname). G: We have agreed, he will be official and you will be official.

38. S: Another question. I'll have reports, and I may feel that I should write with the aid of carbon paper, to conceal some important information. I'll send you a sheet of clean paper. How will you know that there is an S/W message there? I should make

some mark. Otherwise you could think that it is a wrapper and throw it away. But I'll have information there. Here, there is the usual, standard paper. I'll make a report out with the aid of carbon paper. How should I mark it so that you would develop it? G: All papers would be checked. S: Maybe I should make some kind of a mark? G:,... something not normal. H: We'll both know.

39. S: But why should you check clean wrappers when there is nothing there, and there will not be. I shall not carry it. But there will be a sheet, folded thus. There will be material..... G: If you had some material and among it there would be a blank sheet of paper then it would be clear that there is something on it. S: Well, the sheet will be folded into four parts. G: Fine. S: Like this ... then develop it. G: That's good, but don't place any marks, if there is a small line it may draw suspicion. S: Oh yes, correct. But I had to ask.

40. S: Now, something has happened to my radio all of a sudden. Well, they have transistors and you are giving me the batteries? If the batteries go down I can throw them away, but if something else breaks? G: You can get it fixed there. It is a normal radio. S: Now, if something happens to this (the Minox), should I send it to you for repairs? H: (in English) The camera? We shall send him the second one by WYNNE. G: You'll get a spare camera via WYNNE.

41. S: Now, another thing. I have another request, such items as a camera, your instructions, do not give it to WYNNE. G: Under no circumstances. S: Send them by diplomatic pouch. As soon as WYNNE arrives he'll get them. At the same time, I have made a note of this. Perhaps it would be worthwhile; please think this over, that is, to send these things here, my suitcase, by diplomatic pouch. When WYNNE comes he will bring it to his hotel. Would that be okay -- the suitcase? G: That is not that simple. S: Is the freight expensive? H: (In English) It is not the question of the price. You see, the plan he (Subject) put out the other day was much better. See, what I don't want to do is to have WYNNE going into the embassy, bringing a dirty grey suitcase. Taking it into the place, it can be noticed. Carry a small package like a briefcase. That is a different problem. As a businessman he can carry it, walk around the street. Carrying a dirty grey suitcase out of the embassy is not normal. G: (translates above into Russian.)

42. S: No. The cars drive inside beyond the gate. The militiaman remains outside. He has no right to go in there because it is inviolable territory. G: But the driver is KGB? S: Whose?

G: The chauffeur? S: No. Now our middleman, an Englishman, has received those things. He knows they are for me, or for WYNNE. He comes to the Embassy; the car drives up to the embassy entrance and WYNNE brings the suitcase to the hotel. This is a variant. G: (In English) He is talking about an official car. The embassy car brings the suitcase to WYNNE's hotel. S: Okay, let's not do it. H: (In English) It is not normal, you see. G: It is not normal. (Note: Several people talk at once. It was agreed that the material would be delivered to Subject in person.) S: Just in case, we must bear in mind, that things could be sent to me by mail.

43. S: I have a Soviet telephone, it is Soviet and bad but that is of no consequence. It works well. We have many Yugoslav, Czech and German telephones. These are not possible to buy since they are ordered by our ministries. My point is this -- It is very simple to take our phone out and make a microphone in our telephones. All my telephone conversations can be heard without lifting the receiver. I have a request, not now, but later. Send me a new telephone through WYNNE or other channels, preferably German or Czech. G: Could you buy one yourself? S: I cannot. G: You could install it? S: Of course. Then they could not tap the line and use the telephone as a microphone. Secondly, the workers come. I had the telephone a long time. They were near the telephone during my absence. I exclude completely that something has been connected, but for safety I want to connect a new one, throw the old one away, and say I bought it.

44. S: They are sold, but it is very difficult to get one, very difficult. As a rule they are distributed. This is my request -- telephone apparatus. I do not want an English one -- German. G: Will it work? S: Yes. Many houses have white telephones, black, small portable ones. Everything is the same. G: How about the magnetic parts? And one could dial? S: Yes. The numbers are the same, the Latin letters are painted over with our own letters. For some reason I want to replace my telephone. G: Have you had any suspicions? S: No. I could say I bought it from a friend, from a telephone man. Think about that. I have a separate apartment. Who would see it? It came from Czechoslavakia; it is difficult to get them. We will have conversations, but the devil knows, you understand, maybe ..... G: Yes, Yes. S: I know, we were taught how to adjust and make a microphone out of our telephones.

45. S: The next very important matter. -- I want you to give it some thought. As soon as another (Soviet) agent, spy is caught, analyze all spies who were caught during the past year, two, three -- Soviets in all countries. Using them as reasons, send a note.

I am leading up to the proposal that personnel of Soviet embassies, trade delegations, and Consulates should be cut. You will chase out many active operational intelligence officers and will create confusion between the services fighting for slots. This would disorganize them for approximately six months, eight, a year, until they sent in new ones. Believe me, I have a good idea. G: Fine. S: In this respect we will weaken them somewhat. I am not saying that we will eliminate completely, but we'll hinder them very much. This is all according to my list .... G: Fine.

(46) S: And we should catch another one, and then analyze, there were so many, who did what, that this situation cannot be tolerated, the blown-up apparatus leads to increased spy activities in a country by Soviet organizations, accredited, abnormally blown-up. It seems to me somehow that we must analyze all this. It seems to me that there are more Soviets than Englishmen and Americans in foreign lands. I looked at the Soviets here -- such a great colony -- a whole battalions. Decrease them, all categories, because spies are installed everywhere beginning with attache, 1st, 2nd secretaries and counsellors. Decrease them all! It seems to me that if you did have to decrease your apparatus in Moscow we still could do business with the existing apparatus. But to deactivate the Soviet organs in England, in America -- this is a very important question. It can be played up from the political point of view. Tell them you have too many -- make it less. We should give this deep thought. It is an important problem.

(47) G: Now I have several questions which we can finish now because the rest we will leave for tonight. We have much to do. We had prepared everything so that it is all systematic. S: I want to add one thing about WYNNE. I want you to tell WYNNE that when he goes to Moscow he should not expect free food, free automobile, free hotel room from either the Government or the Committee in which (Subject's surname) works. He will not be given a free room on the Exhibit grounds. This is not England. Just because he wined and dined and drove them in a car here thus saving them money for their personal expenses, tell him not to demand the same from (Subject's surname). He has been telling me from time to time that he hoped that I would arrange everything for him there. There will not be anything. No one will sign the order to issue funds for WYNNE. For that reason WYNNE should be taken care beyond that which the firms give him in terms of minimum allowance. Let him go alone, without his wife although I am not ashamed before him. I cannot do anything for him. I am not permitted to do this at my personal expense. Tell him not to be angry with me. Whatever I can do for him I'll do. H: Allright, we will do this.

48. G: Prior to our last review of the signal plan, here is a simplification of the time schedule. There would be only one transmission per month sent repeatedly every Saturday and Sunday at 2400 hours. S: This is wise. I agree. Let me review what I will take with me -- the instructions, the signal plan, film, and this -- the camera. The transistor is in the suitcase. I'll put the medicine and catalogues on top of it. G: The S/W -- there is nothing on it now. S: This will be here; it will be under my feet. G: Now all this -- three sizes -- do them by tomorrow morning. S: Yes. Now these one-time pads would be in my pocket. That's clear.

49. S: Now about this notebook where USA is written, the black cover, perhaps I shall not take the cover. I'll join the four sheets of carbon paper like this and the rest will be clean paper. I'll not take the cover. G: Okay. S: It is too large, and then there is "Made in USA". If it were a beautiful cover that would be another matter, but it is of the common type. It is good for camouflage. I'll camouflage the carbons with something else. G: Maybe we can get a British cover. H: Yes, we can. S: And I'll transfer the carbon into it.

50. S: Now, let us think, gentlemen -- WYNNE could not come for some unforeseen reason; someone gave me the signal; I go to the dead drop. We already worked that out. G: Yes, and instructions for you would be there. S: Yes there would be questions and instructions. It does not matter. Then I'll be making a contact with that girl and the baby carriage. G: All instructions will be there. S: Now I have a request. There were suggestions; we had talked much. Very many matters were decided. All your other advice write down for me. I'll read everything, and burn it well. G: We propose do do all that tomorrow.

51. G: We'll review photography, we'll look at the ciphers, I'll show you -- S: You gave me a cipher for 70 groups. After I decode it, how do I reply? Perhaps something would be urgent -- to whom do I reply? G: There will be instructions on that. S: Do you have the telephone number for me? G: You'll have it tomorrow. All operational matters will be taken care of tomorrow and will be prepared clearly and simply. Already you know when to listen to the radio, you have a choice as to what day.

52. S: I want to tell you something. SHAPOVALOV had requested me to see General LYAKHTEROV. He is the deputy of your relative KHLOPOV. He was formerly the Chief of the Fourth Directorate. SHAPOVALOV had compiled a dictionary on the Hindi language and turned it in to the Foreign Language Department of the Military Diplomatic Academy so that they would edit it and have it published. I

am telling you this so that you would know how well he knows Hindi. He has compiled a dictionary. He has business not with one agent here, probably more, but he has one for sure who can be easily caught.

53. G: There are several questions left. We cannot cover all of these but we still have a half hour left. We'll do as much as we can. There are rumors that you have duplicate headquarters for the Party and for the Government in the event of war. They are organized. These headquarters are hidden somewhere in the Urals or somewhere else. Have you heard about them? S: What kinds of headquarters, military? G: The kind which are needed to operate, such as Party headquarters, area headquarters -- in case of war. S: Those are emergency headquarters. All reserve sites for military purposes, ministries, etc., all government functions, have been set up. All this has been worked out.

54. G: The military, too, since this is easy to displace. S: Yes. There is a huge Command Post. They are in the subway in Moscow, somewhere between the Kremlin and the General Headquarters, deep below. There is an electric (train) that goes there. That exists. G: Are there any in the Urals area? S: Yes there are. Operational groups fly there from every ministry. Everything is in the rocks, underground. G: You do not know exactly, but in the Urals area? S: In the center of the Urals somewhere. There are shelters there.

55. S: By the way, I think I mentioned that in the Urals there are aviation hangars, underground factories. There are very many underground structures, but it is very, very expensive. I've been told that this takes up so much money that there are no roads. There is not enough money for the roads, but for civilian and military defense constructions there is plenty of money. G: Probably this duplication also exists in military districts, PVO, etc.? S: Yes, absolutely. The commander of the district takes care of that. He has an engineer directorate with engineer brigades to do this. This is the problem for commander of the district according to the mobilization plan. Only military, not civilian.

56. G: In the event of an unexpected war, how much reserve supplies do the land troops have? What is the supply level? S: I know that exactly -- 30 days. G: In place? S: In place. But, take a regiment -- it would not all be in the regiment's hands. It would be in rear supply points. The units have a five-day supply carried on hand, also canned foods, hard tack, etc. G: That would

be for the theater of operations? S: Yes. In general, the commander has a 30 day supply. If he does not receive anything, he will be able to feed large units. He has flour, grits, concentrates and canned goods ..... G: Who is responsible for this supply, say for a Group of Forces? S: That is done by ORGMOB. That is the soul of the army. G: Why do you say that? S: The ORGMOB, the Organization-Mobilization, abbreviated to ORGMOB. It can be a directorate.

57. S: Now, in general, you have just brought up a question, a strategic one. It is an important problem. We had talked about it.. The OBLASTs' VOYENKOMAT must be spotted and destroyed. They are vital. G: This brings up the question of what exactly is the mobilization plan. Who decides where recruits should go? S: Beginning with the Organization and Mobilization Directorate of the General Staff and running through all the military districts and through the OBLASTS, city and RAYON as well as village councils where they have military conscription registration desks, the latter is the cell of the system. Down to and including the offices of the RAYON there are sealed envelopes. These are to be opened in the event of war by each RAYON VOYENKOMAT. The contents have been prepared by the General Staff. The instructions state exactly according to what plan what should be done. This plan has been completely worked out in time, phase, periods, such as H-hour, H plus one, etc. This plan has prepared lists of what personnel will go to what units, where vehicles, equipment and even horses will be assigned. The local commander at this point merely opens the envelope and follows the immediate instructions prior to receiving instructions from higher command. Even if a coded cable did not arrive from the OBLAST or military district headquarters yet, until receipt of such, the local commander knows exactly what to do. This includes dispositions of personnel, supplies, equipment, etc. He would know what to do for the first three days. Supplemental instructions covering the period up to D plus 90 will follow later.

58. G: Is the VOYENNY BILET still used as in the past? S: Yes. I have one and I will send you a photocopy of mine. G: Does it also include the pink mobilization insert? S: Yes, it does, but it is given only to lower ranking personnel, non-coms and officers through the rank of captain. Majors and above no longer have this insert. They gave me a VOYENNY BILET as a legend that I had been demobilized. You will see a copy of this -- in fact, I will devote an entire film to my documents. You will see my Party BILET, my UDOSTOVERENIYE LICHNOSTI and all my various passes to different organizations, my VOYENNY BILET and my civilian passport. This passport which is given to all officers who work in intelligence and

and receive civilian passports is called an operational passport. Pay close attention to the numerical designation on this passport. I will underscore it for you. If a militiaman checks my passport and notices these numbers, he will pass me by, realizing that this is an operational passport and that I have not been demobilized or anything of that sort. Otherwise, except for the code number, it looks like any civilian passport.

59. G: What kind of alerts do you have? For example, there are training alerts and then there are other categories. S: There is the air alert which exists as in the past, a chemical warfare alert, and there is a combat alert for troops to assemble troops. This is a general alert. For example, at the academy there were specific assembly points for each of the five departments and for the instruction personnel. ODINTSOV would always call one of these every two months as a practice alert. A general alert may be followed by a chemical alert. The general alert is the basic one. Then they criticize deficiencies in the speed of assembly.

60. S: In the General Staff we also have a system of OPOVESHCHANIYE which means who should notify whom in case of an alert. This is the key to insuring the desired assembly in case of an alert. In garrison positions alerts can be easily signalled by sound devices, but where people live in civilian quarters a personal contact method by phone and even in person must be established. Each officer must always have a small suitcase with minimum articles for personal use prepared for immediate pickup. Other academies may have only one alert in three months. That is done either on the individual direction of the chief or by an overall garrison commander.

61. G: To what extent is combat ready equipment brought out? S: Vehicles and artillery are brought out including ammunition, etc. One cannot tell whether or not consequent action will take place after the alert is sounded. G: Is there any practice alert which takes place in a skeletonized form without equipment, etc? S: Yes, but it is still a general alert with specific instructions added to it, namely to assemble without this and that equipment or arms. So it is simply a general alert with qualifications. But there is no such category as practice alert.

62. G: What type of annual maneuvers and troop deployments take place? S: I will send you the manuals covered in this and you can see all the details for yourself. G: How about the army reserves? Do you not have large numbers of both enlisted and officer reserves? S: There are extensive reserves and they continue to train them by means of assemblies. G: How often do they have to go? S: That depends on what their VUS (VOYENNO-UCHEBNAYA SPETSIALNOST') (MOS) is. If they are technicians, they are called out every year.

But if he is a veterinary, and we have few horses now, he may be called once in three or five years. Now that technical equipment plays such a great role and technical units are extensive, engineers and technicians are called up to be trained in new technology. There are ten-day training periods, one-month and three-month training periods. It all depends on what the training program has been set for.

Reserve training

63. G: What do you estimate the size of your reserves to be? S: I am afraid to guess, but if you insist on a rough estimate I would say that there is at least one reservist for everyone on active duty in most categories, and in certain specialties there would be two or three reservists per a comparable man on active duty. Of course, we always have new conscripts. G: Yes, but that is a different category.

Size of Reserves

64. G: When KHRUSHCHEV stated in 1959 that the army would be reduced by one million two hundred thousand troops to what extent was this demobilization actually carried out? S: This problem has not yet been decided even now. This is just idle conversation and complete deceit. Under this pretext they are discharging physically unfit, old people, and politically unreliable persons. And the rest they don't touch. He has made many skeletonized units out of divisions and regiments. But all key personnel, the unit designation, remain just the same. In case of emergency, in three days the unit can be filled out according to the organization-mobilization plan. If the OBLAST VOYENKOMATY would be destroyed, there would be complete panic in case of war. They don't even have real safes where their papers are kept, but strong boxes which would easily be destroyed in a good fire. If the contents were destroyed, even though reservists would know where to report initially, they would not know what to do from there on since all details are included in the mobilization plan.

Troop Cuts '59?

Ready for emergency

65. G: What would you say that the strength of the Soviet Army is now? KHRUSHCHEV mentioned that there are approximately three million six hundred thousand. S: We estimate it to be about five million. G: Is this from rumor or from statistical data? S: After all, when one works in the General Staff and breathes this air, it is not difficult to compute, despite reductions in strength, how many divisions there are, etc. We estimate that, including all armed forces, there are five million. G: Can you give a breakdown? S: We already estimated together what the main headquarters consists of and got up to a hundred and fifty thousand persons and I told you that the headquarters of the Ministry of Defense alone has twenty-eight thousand. This I know exactly. G: How about the breakdown by air forces, naval forces, etc? S: This is known to the Minister of Defense, his deputies, the Central Committee, the chief of the General

Strength of Soviet Army

Access general o.f., but not specific

Staff and the chief of the Mobilizational and Organizational Directorate. If you ask SEROV, he wouldn't know. However, he would know more about it than I do.

66. G: Do you have any idea of the budgetary allocation given to GRU? S: When I was in Turkey I remember a little of the computations. First of all they consider, of course, the officers' pay. Five years ago we had seven thousand generals. I don't know how many we have now. There they would compute for foreign duty what the monthly equivalent pay would have to be in foreign currency. I received 2,000 lira per month or 24,000 per year. Then all other intelligence personnel were computed similarly. Our operational funds were always in a rotating fund -- 15,000 lira. This was used for agent support. G: Suppose you had a rather expensive operation? S: For this, supplementary funds would be sent from Moscow. Monies are transferred through the embassy and the finance officer knows for whom the allocations are. Agent support funds, operational travel, and even operational entertainment, are all operational funds. Vehicle repair, housing, etc., are administrative funds. I can't give you a GRU total, although I could break down what individual incomes are.

67. G: How about the total military budget? How is that broken down? S: That is deliberately never broken down. KHRUSHCHEV may announce that there are one hundred billion rubles for military purposes, but no breakdown is given. This is always a reduced figure because there are other funds from which payments are made to factories which produce more material. You should always assume that the announced military budget is actually two to two and a half more times than what is publicly announced.

68. G: What does it mean for example when he stated that 30,000 rubles would be allocated for the development of the ICBM? S: I am not familiar with that figure and have not seen it used officially. Possibly KHRUSHCHEV said something out of turn once, but I am positive that the amount allocated for rocket development is much greater. Even VARENTSOV who is supposed to get a certain amount from the budget is always attempting to get supplementary funds from covert sources since he needs more money. He once told me this. He had been responsible for a considerable quantity of conventional artillery which did not have proper protective shelter and he was authorized to order large quantities of canvas covers. However in a year or two these covers rotted. So he discarded these at a loss of several million rubles and spent twice as much to construct permanent steel and concrete shelters. Despite the ultimate saving over canvas as well as the preservation of ordnance, he was criticized for this big expenditure.

Cost of V-75 — MIG-15 — Access — ECK
